

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

NEW AMERICAN CYCLOPÆDIA.

ARAKTSHEEFF

ARAKTSHEEFF, Count, a Russian statesman, born in 1768, died April 21, 1834. His name is deeply interwoven with the history of his country in the present century. Descended from an insignificant and obscure family, he was educated in the military school of St. Petersburg. He entered the artillery, and in this branch of service reached the highest rank. He was one of the favorites of Paul I., and for a short time governor-general of St. Petersburg, but was dismissed on account of the insufferable harshness of his character. Paul made him commander of his favorite regiment of guards at Gatchina, an imperial residence in the environs of the capital. Suspicious of danger, and especially distrustful of Count Pahlen, Paul, the day before his murder, sent an order to Araktsheeff to march with his regiment instantly to the rescue of the emperor. The courier was detained by the conspirators, and Araktsheeff reached the barriers of the capital after the crime was accomplished. Alexander, the successor of Paul, kept Araktsheeff near his person. He was most influential with that emperor during his whole reign, and the only one who remained unshaken in his master's favor. Araktsheeff was active, energetic, but hard, and filled with the utmost contempt toward mankind. The military colonies introduced into Russia under Alexander, were created and organized by Araktsheeff, amid bloodshed and cruelties, and the curses and tears of the Russian people. During the last years of Alexander's reign, Araktsheeff was created a count, and became virtual ruler of the empire. He had in his possession blanks with the imperial signature, and was thus enabled to issue laws and ukases. On Alexander's death he returned these blanks to Nicholas, who sent him in exchange, as relics, a coat and trowsers of the deceased emperor. Soon after, Araktsheeff was ordered to confine his residence to his estates at Gruzina, in the government of Novgorod, where he died the blackest misanthrope. He left his large fortune to a military school founded by him in Gruzina. By one of the clauses of his will he ordered the sum of \$20,000 to be deposited in the bank of

ARAM

St. Petersburg, to serve, with the accumulated interest, as a prize for the best history of the reign of Alexander, 100 years after his death. It is supposed that this part of the will was annulled by the emperor Nicholas.

ARAL, a large inland sea of independent Tartary, between lat. 40° 20' and 47° 0' N. and long. 57° 25' and 61° 0' E. It lies between the steppes of Kirgheez and Khiva. Its elevation is, according to Humboldt, the same as that of the Caspian, of which sea he supposes it to have been a part. From the east, the rivers Sihon, or Jaxartes, Kuwandaria, and Jandaria, flow into it. As these rivers do not furnish a supply of water equal to the amount which evaporates, the lake is thought to be lessening. The Aral is supposed to be very shallow. It abounds in fish. The water is brackish, but is freely drunk by horses, and is used for culinary purposes. Humboldt supposes the Aral to have been an enlargement of the Oxus, now its principal tributary, but formerly a tributary of the Caspian, next to which the Aral covers a larger area than any inland sea in the eastern hemisphere.

ARAM, **EUGENE**, an English scholar, born in 1704 at Ramsgill, in Yorkshire, tried for murder at York, Aug. 8, 1759, found guilty, and executed within 8 days after the trial. The name of his victim was Daniel Clark, a shoemaker of Knaresborough, and the motive of the murder was said to have been plunder. This trial created as great a sensation in Old England, as the trial of Dr. Webster created in New England. Eugene Aram enjoyed a remarkable reputation for extensive scholarship, acquired under the greatest difficulties, his father having been a poor gardener, and no advantages of study and education having been afforded to him but those which he secured for himself by his indefatigable industry, and unswerving perseverance. After his marriage, he established himself as a schoolmaster in his native district of Netherdale. In 1734 he removed his school to Knaresborough, where he remained till 1745, when he became implicated in a robbery committed by Clark, and although discharged for want of evidence, he thought it best to leave the little place, and proceeded to London,

while Clark disappeared mysteriously at the same time, nothing transpiring about him until Feb. 1759, when a skeleton was dug up near Knareborough, which was suspected to be that of the miserable shoemaker. Aram, in the mean time, while employed as school usher in various towns, and latterly at an academy at Lynn in Norfolk, pursued his favorite studies of heraldry, botany, the Chaldee, Arabic, Welsh, and Irish languages, with his wonted activity, and was just engaged in compiling a comparative lexicon of the English, Latin, Greek, Hebrew, and Celtic languages, when he was suddenly arrested on the charge of murder. It seems that Aram's wife had frequently intimated that he and a man named Houseman were privy to the mystery of Clark's disappearance. Houseman, on being pressed by the coroner, before whom he was immediately taken, testified that Aram and a man named Ferry were the murderers, and that the body had been buried in a particular part of St. Robert's cave, a well-known spot near Knareborough. The skeleton was discovered in the exact place indicated, and Houseman's conclusive evidence led to Aram's conviction. Aram refused the services of counsel, and conducted his own defence in an elaborate, scholarly, scientific manner, which added to the interest created by this celebrated trial. His defence was an ingenious plea of the general fallibility of circumstantial evidence, especially that connected with the discovery of human bones. He brought together a great many instances to illustrate his argument, and seemed really more carried away by the abstract philosophy of his argument, than impressed by the terrible relation it bore to his fate. After condemnation, he acknowledged his guilt to two clergymen who attended him, but declared that Houseman's share in the murder was larger than he acknowledged. This was also the general impression left on the public mind. Aram declared that he was not instigated to the murder by covetousness, but entirely by jealousy, as he suspected Clark to have made love to his wife. On the night before the execution he attempted suicide, but was discovered before he had bled to death, and his sentence was carried into effect. In this singular man's mind, the most criminal tendencies were set off by a species of intellectual fermentation. Before he attempted suicide he wrote an essay on the subject. He wrote out a sketch of his life, and some poetry. His "Comparative Lexicon" has not been preserved, but passages from the preface are extant. He left a widow and 6 children, 8 sons and 8 daughters. A veil of poetry has been thrown over his fate by Thomas Hood's ballad of "The Dream of Eugene Aram," and by Sir E. Bulwer Lytton's romance of "Eugene Aram." Bulwer states in his preface that "he has exercised the common and fair license of writers of fiction with the facts on which the tale of Eugene Aram is founded." The Eugene Aram pictured by the English novelist, is unmarried, and surrounded with a singular

halo of romance, which occasionally reminds us of Faust, and his wrestlings with science; at other times of Hamlet and his dark introspective broodings; again, of Abelard and his love for Heloise. The English scholar's Heloise is a high-souled Yorkshire girl, Madeline Lester, the genuine daughter of a genuine English country squire, who falls in love with the lofty bearing of the pale, inscrutable scholar, just as Desdemona fell in love with the dashing prowess of the fiery, impulsive Moor. Bulwer says that "the place in which the lovers rested is one which the villagers to this day call 'the Lady's Seat,' for Madeline, whose history is fondly preserved in that district, was afterward wont constantly to repair to that bank." St. Robert's cave, where the bones of the murdered man were found, is to this day eagerly inquired for by visitors to Knareborough, who, while they walk in the dismal, dreary spot, are powerfully reminded of the concluding stanza of Thomas Hood's ballad on the subject:

That very night, while gentle sleep
The urchin-eyelids kiss'd,
Two stern-faced men set out from Lynn
Through the cold and heavy mist,
And Eugene Aram walked between,
With gyves upon his wrist.

ARAM, ARAMAIC region, in Semitic antiquity, the country between the Mediterranean and the boundaries of Persia and Media on the one side, and Asia Minor or Armenia on the other. It contained Chaldea and Assyria in the east, Syria and Mesopotamia in the west. The ancient Hebrew books give the name of Aram to what is now known as Syria, or Soristan. — ARAMAIC LANGUAGE, spoken anciently in the above-named countries, is the northern branch of the primitive Semitic root. It is divided into the East Aramaic or Chaldean, and the West Aramaic or Syrian. The difference between the two consists in some lexicological peculiarities, and especially in the accentuation of the vowels. They are closely connected dialects.

ARANDA, PEDRO PABLO ABARACA Y BOLSA, count of, a Spanish statesman, descended from an ancient family of Aragon, born at Saragossa in Dec. 1718, died 1799. In early life he served in the army, but subsequently devoted himself to the civil service, for which he carefully prepared himself by studies at home and travels abroad. After officiating for several years as ambassador of Charles III. at the court of Augustus III., of Poland, he was, on his return to Spain, appointed commander of the army in Portugal. Here he distinguished himself by the capture of Almeida, in Aug. 1762, and by various other exploits, and in token of his eminent services, he was in 1765 appointed military governor of Valencia. In the following year, when a revolution broke out in the capital, the task of quelling it devolved upon Aranda. He was made president of the council of Castile, and soon after prime minister. In this capacity he displayed extraordinary powers of mind, which made his administration a blessing to

Spain. He inaugurated a new municipal system, established schools, provided Madrid with a permanent garrison, strengthened the army and navy, gave a vigorous impetus to the flagging industrial and agricultural interests of the kingdom, and reformed the financial condition of the bank of San Carlos. The wildernesses of the Sierra Morena, infested by wild beasts and brigands, were thrown open to civilization by laborious German, French, and Swiss settlers, who took up their abode there in obedience to Aranda's invitation. The much-abused right of asylum was limited to two churches in the capital of every province. He abolished the religious plays, which, on holy week festivals, generally gave rise to riots. In the ecclesiastical court, he substituted native for papal magistrates. At the same time he established a law which made the sanction of the council of Castile requisite for the validity of the decrees of the Vatican. He went even so far as to lift up his voice against the inquisition, and established a political censorship in order to neutralize its influence. By a decree of April 2, 1767, the Jesuits were expelled from Spain, and their property confiscated. But the hostility of the clerical party soon rendered Aranda's position well-nigh intolerable. Moreover, his confidential correspondence with Voltaire, who, in 1771, had written a strong letter urging him to persevere in his work of reform, was discovered and published. In order to avoid a fatal overthrow, he tendered, in 1773, his resignation as prime minister and accepted the post of ambassador at Paris. Here he became noted for his opposition to England. This had always been the leading feature of his foreign policy, and during the American war, which then absorbed the attention of the European cabinets, he found the long wished for opportunity of giving a deadly blow to British power by prevailing upon Charles III. to join France in supporting the cause of America. In 1783 he had the satisfaction of putting his signature to the treaty of Paris, which recognized the independence of the United States. In 1787 he returned to Spain, but kept aloof from public affairs until 1792, when he was invited to reassume his former position of prime minister as successor of Florida Blanca. But his old master, Charles III., was no more, and under Charles IV. there was little room for a statesman like Aranda. He was met by a camarilla, headed by a worthless queen, bent on his ruin; and after a few months of vain struggles he was forced to surrender the place to the queen's favorite, Godoy. Nominally he remained president of the council, but for all practical purposes his power was at an end. Finally, on occasion of the war with France, he expressed himself against its justice, and this remark was eagerly seized upon as a pretext to send him into exile in Aragon, where he passed the remainder of his life.

ARANJUEZ, a small town in the province of Toledo in Spain, about 26 miles from Madrid.

It is the site of a royal palace of great beauty, whose groves and avenues are the favorite retreat of the monarchs of Spain during the spring months of the year. Philip II. founded it, and it was enlarged and beautified by subsequent monarchs. The residence during the summer is not considered healthy on account of the vapors arising from undrained land in the vicinity. The present queen is particularly partial to Aranjuez.

ARANY, JAKOS, one of the most distinguished Hungarian poets of modern times, born 1819, in Nagy-Szalonta, in the county of Bihar. He is the son of a poor Protestant cultivator of the soil, who educated him for the church. In 1832 he went to the college at Debreczin. He afterward joined a troop of strolling players, and gained some knowledge of the world and of life in this precarious manner. He then returned to Szalonta and supported himself in his native village as a Latin teacher. In 1843 the Kisfaludy society offered a prize for the best popular epic. Arany sent in anonymously his first poem, *As elevenet alkotmany* (the Lost Constitution), which won the prize. In 1847 he sent in to the same society, and under the same anonymous guise, the first part of a trilogy (*Toldi*). The society gave to the author more than the stipulated price, and had it printed at their expense. By the patriotic spirit of his writings, Arany became the darling of young Hungary, and obtained popularity even with the working classes. In Feb. 1848, appeared his *Murany Ostroma* (the Conquest of Murany), which did not excite much attention, in consequence of the Hungarian revolution. The national ministry of Szemere employed him as draughtsman, but he was not prosecuted by the Austrian government on the defeat of the patriots. Since then he has published a narrative poem, *Katalin* (Pesth, 1850), beside many smaller pieces scattered about in the periodical literature of the day. *Toldi*, and the "Conquest of Murany," have been translated from the Magyar into German, by Kertbeny, Leips. 1851.

ARARAT, a celebrated mountain of western Asia, subdivided into 2 peaks, Great Ararat on the N. W. and Little Ararat on the S. E., whose bases blend, while their summits are nearly 7 miles apart. The summit of Great Ararat lies in lat. 39° 42' N., long. 43° 38' E., and is 17,328 feet above the sea level, and 14,820 feet above its base. At a point 3 miles below its summit downward it is constantly covered with snow and ice. Little Ararat rises 13,093 feet above the sea level, and 10,140 feet above the plain on which it stands, and is free from snow and ice in September and October. The 2 mountains are of volcanic character, an eruption having taken place from them as late as July, 1840. The apex of Great Ararat was visited on Oct. 9, 1829. Ararat is the central point of the dividing lines of the division of Armenia, between Russia, Turkey, and Persia.

ARARAT, or PILOT MOUNTAIN, a mountain of North Carolina, in Surrey county, between

the Ararat and Dan rivers. It is of a pyramidal form, and one-third of a mile in height; and its top is a plateau one acre in extent, on which is a gigantic rock 800 feet in height. This summit is seen from a long distance on every side, and used to guide the wanderings of the Indians.

ARARAUMA, a salt lake in Brazil, about 23 miles long and 7 wide. The tide rises in this lake, through its communication with the sea, to a height of 50 feet. It is about 5 miles from the sea, and is longest from east to west, lying parallel to the coast.

ARARIPE, *SINA DE*, a chain of mountains in Brazil, forming the boundary between the provinces of Ceara and Pernambuco. They are semi-circular in form, and are in about 7° S. lat. and 89° W. long. The city of Orato lies within the semicircle formed by these mountains. They are the source of several considerable rivers.

ARAS, a river of Turkish Armenia, rises in the pashalic of Erzroom, in lat. 41° 30' N. and long. 41° 10' E.; flows eastward, dividing the territories of Persia and Russia, and joins the Koor in the Russian territory 60 miles west of its fall in the Caspian. Its length is 500 miles.

ARATICA, or **CARLSHOFF**, one of the Society islands, Panmotu group, Pacific ocean, in lat. 15° 20' S. long. 145° 39' 46" W. It is 8 miles in length by 5 in width.

ARATUS, an old Greek poet, born at Soli in Cilicia, flourished about the year 270 B. C. He was educated under Dionysius Heracleotes, a stoic; the principles of which sect Aratus embraced. He was a friend of Ptolemy Philadelphus, and also of Antigonus Gonatas, king of Macedonia, at whose instigation he composed two poems upon astronomical subjects. One of these, *Phænomena*, described the heavenly bodies and the constellations, giving their names and their movements. The other, *Diosemia*, described the influence of those bodies upon the atmosphere, and their effects in different situations upon animals, and by these means making prognostics of the weather.—These poems are written with accuracy and general elegance, and comprise most of the astronomical knowledge at that time possessed by the Greeks. Aratus was the author of many other works, both prose and poetry, but none are now extant. He is the poet whom St. Paul quotes in his celebrated speech on Mars hill, Acts xvii. 28. The best edition of his works is by Buhle, Leips. 1801, 2 vols. 8vo.

ARATUS, son of Clinias, born at Sicyon 271 B. C., the man who first made the hitherto insignificant Achæan league a power in Greece. His native city was ruled by one of those Macedonian magistrates called tyrants, who ruled so many Greek cities after the Macedonian conquest. His father, Clinias, was put to death in one of the political contests of Sicyon, and young Aratus, then only 7 years of age, was for the sake of safety secretly conveyed to Argos. He

was educated by the friends of his family at Argos as a gentleman; as he was vigorous and robust, he excelled in gymnastics, and took off the prize in the 5 several branches. As was natural, he aspired to regain his hereditary position, and associated with himself the Sicyonian exiles in a plot to rid their native city of the tyrant Nicocles. This operation was carried out with the greatest good fortune, their most perilous hazard, according to Plutarch, arising from the gardeners' cur-dogs, "which were little, indeed, but at the same time extremely fierce and furious." Nicocles escaped, and the revolution was effected (251 B. C.) without a single person being killed or wounded. Aratus recalled 580 of the exiles, all in a very destitute condition, and eager to recover their property and standing. The exiles appointed him sole arbiter of their claims, but he declined this delicate trust, and joined 15 of the citizens in the commission. He reestablished harmony between the aristocrats and the democrats, and the returned exiles were so well satisfied with the awards, that they erected his statue in brass, and placed beneath it glowing tributes to his virtues. Antigonus Gonatas, king of Macedonia, watched the growth of the Achæan league with a jealous eye. Aratus strengthened himself by an alliance with Ptolemy Euergetes, king of Egypt, who advanced money to satisfy the claims of the Sicyonian exiles. In pursuance of the same anti-Macedonian policy, he caused the enrollment of Sicyon in the Achæan league, and the Achæans made him their general. While holding this office, he meditated the project of surprising the Acro-Corinthus, the strongest citadel of the Peloponnesus, and expelling therefrom the Macedonian garrison. He took the citadel with 400 men, came down into the theatre, where he was welcomed with acclamations, and made a speech to the people, imploring the citizens to join Corinth to the Achæan league, and to admit an Achæan garrison. The Corinthians acquiesced, and he delivered up to them the keys of their city, which they had not possessed since the days of Philip of Macedonia. Aratus contributed 20 talents out of his private fortune toward the bribe of 150, which was given by the cities of the league to the Macedonian governor of Athens, to give up the citadel to the Athenians and the Achæans. The Macedonian monarch was not his only opponent. The fierce and barbarous Ætolians used to make descents upon the lowlands of Achæa. His next great enemy was Cleomenes, of Sparta, who sought to reestablish the ancient Spartan hegemony over the rest of the Peloponnesus. Aratus and the league were uniformly defeated by the young and ardent Cleomenes, and the reputation of Aratus suffered a disastrous eclipse. The successes of Cleomenes emboldened him to demand the generalship of the Achæans, and in this crisis Aratus advised them to call in the help of the Macedonian king, Antigonus Doson, at the price of delivering up to him the citadel of Acro-Corinthus. This act

has been much condemned. Plutarch argues that Aratus should rather have ceded to Cleomenes' demands, because Cleomenes was one of the Heraclidae and a true-blooded Hellene, which the Macedonian was not. The Ætolian barbarians afterward defeated Aratus, and great complaints were made at the Achaean congress about his imbecility. Antigonos Doson, on his death-bed, conjured Philip, his successor, above all things to be guided by the long experience of Aratus. Indeed, Philip's affairs prospered in his hands. The Macedonian courtiers, however, did not like the Greek counsellor, but reviled and abused him at table, and once threw stones at him as he was retiring to his tent. Philip gradually became alienated from Aratus, and at length removed him with a slow poison. Aratus was conscious of the cruel deed, and bore it patiently, simply saying, "Such, Oephalon, are the fruits of royal friendship." He died at Ægium, after he had been 17 times general of the Achæans, but at the desire of the Sicyonians he was buried in their city. There they were wont to offer 2 yearly sacrifices, one on the anniversary of the deliverance of the city from Nicocles, the other on his birthday. Plutarch says that in his day some traces of the ceremonies still remained, though they had been mostly worn away by time and other circumstances.

ARAUCANIANS, the name given to a South American confederation of kindred tribes who have maintained their independence of Spain and the republics of Spanish origin which environ them. They inhabit the country comprised between lat. 36° 44' and 39° 50' S. and long. 70° and 74° 30' W., and bounded E. by the great Cordillera of the Andes, W. by the Pacific ocean, N. by the river Biobio, and S. by the Callacalla. Their territory thus extends 186 miles along the coast, its breadth, from the sea to the crest of the Andes, being, perhaps, about 150 miles. The name Araucanian is derived from the Indian word *awca*, meaning frank, or free. The productions of the country are similar to those of the republic of Chili, with which the Araucanians live in close alliance. As decidedly the most successful and largest example of Indian self-government in the presence of the European races, the Araucanians, their history, and their manners, are matters of considerable interest to the philosopher and the ethnologist. The chief authority with regard to them is "Molina's History of Chili," composed in Italian and translated into Spanish by Mendoza. Six different poems have been written by Europeans upon their patriotic struggles against the European invaders. The best is the *Araucana* of Alonso de Ercilla, a Spanish knight of the 16th century, who took part in the wars he describes. The Araucanians were first invaded by the Spaniards in 1587. Valdivia founded many settlements in their country, which were destroyed in 1602. A pious Jesuit missionary impressed upon the Spanish government the advantage of living at peace with these tribes, but a quarrel about a Spanish

lady and some Araucanian converts to Christianity broke up the negotiations. In 1641, the marquis de Baydes made a treaty with their chief, but in 1665 war commenced again, and lasted at intervals until 1778, when Spain at length acknowledged the independence of the Araucanians, and allowed them to maintain an embassy at Santiago de Chili. Since this period, the Araucanians have made good progress in the arts of peace. In the contest between the mother country and the Chilian colonists, they preserved a strict neutrality. Schmidt-meyer visited them in 1820, and published his "Travels into Chili, over the Andes," in 1820-'21; the latest work on the subject is the very instructive book of Mr. Edward Reuel Smith, of the U. S. astronomical expedition in Chili, "The Araucanians; or, Notes of a Tour among the Indian Tribes of Southern Chili," New York, 1855. Their polygamy and marriage ceremonies, their mode of dress, their funeral rites, their calendar, their cultivation of oratory, poetry, and medicine, their civil and criminal common law, their languages, and their habitations, are so similar to those of other Indian tribes, and, in many respects, to those of savage life the world over, that we pass them by without special notice. Their political condition, on the other hand, is peculiar, as are also, to some extent, their religious ideas, which are largely colored by their political institutions. The territory of Arauco has been from time immemorial divided into 4 *vuthanmapus* or *uthalmapus*, or provinces, each presided over by a magistrate called a *toqui*; these 4 provinces correspond to the natural divisions of the country, viz., the maritime province, the plain province, the province at the foot of the Andes, and the province in the Andes. Each of these is divided into 5 *illarehues*, which we will call counties. In each county is an *apo-ulmena*, who, under the *toqui*, presides over the county; each county is further subdivided into 9 *rehues* or townships, over each of which presides an *ulmena*, or head of a clan. The symbol of a *toqui* is an axe of porphyry or marble; of an *apo-ulmena*, a staff with a silver head and a silver ring round the middle; of an *ulmena*, the same without the silver ring round the middle. All of these dignities are hereditary according to primogeniture. No regular tribute or any pre-dial service is payable by the clan to the *ulmena*, by the *ulmenes* to the *apo-ulmena*, or by the *apo-ulmenes* to the *toqui*. Every magistrate must support himself out of his demesne lands. In time of war, however, military service is acknowledged as the most sacred of duties. Then, the general subordination from the grand *toqui* to the simple clansman, is brought to light. This brings us to the central government. The 4 *toquis*, or governors of provinces, form the grand council of the Araucanian federation. This grand council is presided over by one of its own members, the grand *toqui*. This council decides on war and peace, conducts the foreign relations, and, on emergencies, calls

together the general assembly or diet of the nation. At this diet, every *toqui*, *apo-ulmene*, and *ulmene*, may attend; it chooses the commander-in-chief from among the 4 *toquis*; but if none of them are qualified, then from the diet at large. The commander-in-chief being nominated and having assumed the badge of command, the other *toquis* lay down their badges of authority and swear allegiance to the dictator. The levy is made by the *ulmenes* upon their several clans. The army consists of both cavalry and infantry. The *toqui* Cadeguala was the first who established a regular body of cavalry, in 1585. The diet is held in a large plain which lies between the rivers Biobio and Danguco. The present grand *toqui*, or president of the Araucanians, is thus described by Mr. Renel Smith: "Mafin-Hueno (the grass of heaven) is very old, his age being variously estimated at from 90 to 100, and even more; but in his appearance there is little to indicate so advanced an age: erect, though not vigorous, with a bright, piercing eye, and his long black hair but sparsely scattered with gray, he might be taken for a person of 60. His nose is slightly aquiline, his cheek deeply furrowed, his chin massive, and his whole air is that of one of strong will, and accustomed to command. His voice is deep but not harsh, and he speaks deliberately, as though weighing well the import of his words; he also listens attentively, as becomes one chosen for his superior wisdom to preside over the welfare of the nation. The dress of the grand *toqui* was not, it must be confessed, such as might have been expected, considering his exalted rank. He wore a shirt that probably had been used for several months without washing, a ragged military vest, and a poncho tied round the waist, and falling to the feet like a petticoat; a red-and-yellow handkerchief surmounted his head, and completed his costume. I noticed, however, hanging overhead, a bridle bit, headstall, and reins, covered with massive silver ornaments, and though the powerful Mafin is generally considered a poor chief, 200 hard dollars would scarcely have furnished the silver lavished upon his various horse trappings." Mr. Smith informs us that Mafin had 20 children, in 1854, with prospect of additions. When Mr. Renel Smith travelled through Arauco, he did so as the adopted son of Mafin, which gave him a good position with the petty chiefs. The religion of the Araucanians is akin to their political institutions. Their Supreme Being is the great *toqui* of the universe; he has his subordinate *ulmenes* to look after details. These *dii minores* are, the god of war, the beneficent god, the god of mankind, and others. Guecubu is the god of evil. The celestials exact no tribute from their subjects here below; therefore the Araucanian builds no temples nor idols, supports no priests, and rarely offers sacrifice. After the death of the body, the soul goes into Paradise, a region which lies on the other side of the Andes. Their religion, in other respects, resembles other primitive creeds. They hate the

Spanish language, and their *toquis*, though well acquainted with it, will never use it on any public occasion. They make a foreigner take an Araucanian name before he is allowed to settle among them; a missionary, when preaching to them, is often interrupted in the midst of his discourse, if he commits a blunder. As this language still remains merely a spoken tongue, its preservation in purity depends upon a strictly accurate use of it in practice. The Araucanians are stoutly built, and of moderate height. Their complexion is olive, and lighter than the other South American Indians, they have a round face, low forehead, short, broad nose, small, fiery eyes, small lips, and long head. Like other Indians, the women do all the home and field work; the men hunt, fight, and tend the flocks. The population has been usually stated to be 70,000, but recent estimates give a much higher number.

ARAUJO, JOZÉ BOREAS DE, a Portuguese philosopher, born at Lisbon in 1667, died 1748, held an official position at Ceuta, acquired some fame by his devotion to philosophy and the fine arts, and published in 1740 two volumes of philosophical writings. His great wealth allowed him to gratify his philanthropic disposition, and he was as much beloved for his deeds of charity, as respected for the solidity of his attainments.

ARAUJO DE AZEVEDO, ANTONIO DE, count da Barca, a Portuguese statesman, born at Sa, near Fonte-de-Lima, in 1754, died at Rio de Janeiro in 1817. In 1779 he became Portuguese ambassador at the Hague, and in 1797 he signed on behalf of his government a treaty of peace with France. He afterward represented Portugal at the courts of Berlin and St. Petersburg, and in 1804 he returned to Lisbon. Soon after his return he was put at the head of the administration, and in 1808, after the downfall of the house of Braganza, he accompanied John VI. to Rio de Janeiro, where he resided until 1812, when he was again invited to become a member of the cabinet of Lisbon. He was appointed minister of marine, and was for some time at the head of foreign affairs; after the death of the Marquis d'Aguiar in 1817, he was called upon to succeed him as premier, but his health could not stand the harassing wear and tear of business, and he died in the same year. Araujo was a man of considerable literary attainments and of generous sympathies. In 1779 he was one of the founders of the scientific academy of Lisbon, and in 1816, shortly before his death, he issued a decree for the establishment of a school for the fine arts in Rio de Janeiro. He translated Gray's Elegy into Portuguese, and he wrote an "Apology for Camoens," addressed to La Harpe, which was published in 1805 by the scientific academy of Lisbon. He was also the author of 2 tragedies and some poetry, and left valuable mineral and botanical collections. Under his administration the first attempt was made to introduce the culture of tea into Brazil.

ARAURE, a city of Venezuela, pleasantly situated on the Acangua, a branch of the Portuguesa, in the province of Apure, about 60 miles N. N. E. of Truxillo, N. lat. 9° 17' W. long. 69° 28'. It was originally founded by the Capuchins. It is laid out with great regularity, and its houses are well built. It has a fine plaza, and a good church. The district, of which it is the capital, produces considerable quantities of cotton and coffee, and raises large herds of cattle. Population, 10,000.

ARAVULLI, or **ARAVALLI**, a mountain range of northern India, territory of Ajmeer, which extends from lat. 24° N., from S. S. W. to N. N. E. for about 800 miles. Its breadth varies from 60 miles to 6 miles. The average height of the range is about 8,000 feet; the highest summits do not exceed an elevation of 5,000 feet.

ARBAOES, the founder of the Median empire, according to Otesias. This author asserts that Arbaces captured Nineveh, and overthrew the empire of Sardanapalus in the year B. C. 876, that he reigned 28 years over the Medes, and that his dynasty numbered eight kings.

ARBALAST (Fr. *arbalète*, *arbalétrier*, a crossbow). This weapon does not appear to have been known to the ancients in a portable form, although it was used on a great scale to supply the place of ordnance. Contrary to received opinion, the crossbow was originally a Saxon, as the longbow was a Roman weapon; and both were used at Hastings, adversely, by the two nations. The principle of the crossbow is that of a perpendicular barrel, or groove, in which the missile is placed, with a transverse bow, the cord of which sweeps the barrel and discharges the bullet or bolt. The ancient bow was made of steel, the cord of strong catgut, and such was the force required to bend it, that it could only be done by placing the bow under the two feet, one on each side the barrel, and drawing the string into the catch, which held it at its tension, by the full exertion of both hands with the aid of a steel winch, as is shown in the ancient illuminations of Froissart. The arrow discharged from the crossbow was called a quarrel, from its four-angled iron head; as that of the longbow was the shaft. A smaller missile, used for shooting on the wing before the invention of gunnery, was known as the bird bolt. Hence the old tavern sign of the *bolt in tun*, the arrow in the mark. The best crossbow men of the middle ages were the Genoese and Picards; it never was an English weapon, nor could ever compete with the longbow. A very large crossbow, called a *trebuchet*, was used in the defence of walled places by the Normans, casting huge beams shod with iron.

ARBELA, now **ARBL** or **ERBL**, a small village in Koordistan, which lies on the usual route between Bagdad and Mosul in 36° 11' N. lat. according to Niebuhr's observations. The houses are built of sun-dried bricks. Arbela was the name of the third and last of the great battles fought between Alexander and Darius 331 B. C. The battle was not actually fought

at Arbela, but at a little place 36 miles west by north, called Gaugamela, now Karmeles. After the battle Alexander crossed the Lycus and rested at Arbela.

ARBITER, a Roman umpire. The agreement by which parties bound themselves to refer matters in difference to an arbiter, was called *compromissum*. Cicero says that the difference between a regular suit (*judicium*) and an arbitration (*arbitrium*), was that the former dealt with cases where a liquidated or definite amount was demanded (*pecunia certa*), and the decision was either aye or no; whereas the arbitration dealt with cases of uncertain or unliquidated amounts.

ARBITRATION, is the submission of civil questions to the judgment of a private individual, instead of to the regular judicial authorities. Crimes can never be the subject of a legal arbitration, because society is interested in the prosecution of criminals to the end, and in the most thorough investigation of offences against law and order. Arbitrators are frequently preferred to the regular courts in every civilized country, because the process is generally freer, the forms are, or should be, less expensive and simpler, and the delay less. The preliminary agreement under which the arbitrator acts, which defines his powers and position, and the subject matter in dispute, is called the submission, and the judgment of the arbitrator is called the award. In many countries the award of an arbitrator is clothed with judicial authority, and, by the observance of certain formalities, can be enforced as a judgment of a regular court of law. In countries where such powers are not granted to an award, the only remedy that lies against the recalcitrant party is an action for breach of contract in that he refuses to obey what by the original submission he had agreed to abide by. Arbitrators are often empowered to order certain things to be done, and, in default, to do the things themselves, and charge the expense to one or both of the parties. In mercantile and industrial contracts a clause is often inserted that differences arising under them shall be referred to an arbitrator, or to two arbitrators, who, in case of disagreement, shall choose an umpire, who shall make the final award. As civilization advances, this system of settling disputes comes more and more into favor. In Athens arbitrators were called *δαιτταροι*. The Justinian code devotes much space to this subject, and has been the basis of all the law concerning arbitration ever since. By an act of the legislature of Pennsylvania, June 18, 1836, arbitrations are made compulsory in that state. Either party to a civil action may insist on referring the suit to arbitrators. If the parties cannot agree, the prothonotary draws up a list of citizens, and the parties alternately strike each one of the list, until only the number agreed upon by the prothonotary is left; these are to be the arbitrators; their award is subject, however, to appeal.

ARBLAY, MADAME D' (Frances Burney), English novelist, the daughter of Charles Burney, a musician, and author of a history of music, born at Lynn, in June, 1752, died Jan. 6, 1840. In her childhood no indications of her remarkable talents appeared. She was silent and timid. At 8 years old she did not know her letters, and was considered by her friends as uncommonly dull and unpromising. In 1760 her father removed to London, took the house in Leicester square that Newton had lived in, obtained the degree of Mus. Doc. from the university of Oxford, and was soon much sought as a teacher of music. Before Frances had acquired the rudiments of an education, her mother died, and she was left to educate herself; for her father had no time to superintend her studies, and seems not even to have supplied her with a teacher or governess. She was not a great reader, especially of novels; but she was gifted with a quick observation, and a facility in writing; and, one very great advantage for the exercise of both these gifts she had in the society which her father's position drew about her. His house was the resort of the most elegant and distinguished people. Johnson was his friend, and Garrick his frequent guest. In his rooms the most eminent musicians gave concerts which lords and ladies attended. Here was rich material for genius to work upon, and Miss B. soon gave indications, by her letters and the little stories she wrote for her own and her sister's diversion, that she rightly appreciated her privileges. Her father was quite ignorant of her talents and tendencies. Her mother-in-law had from the first discouraged her writing of tales; but her genius could not be restrained, and, in 1778, "Evelina" was published, under an assumed name, by a Mr. Lowndes, who gave her £20 for the copyright. Though the author of the book was unknown, and the publisher was not eminent, its success was marvellous, and Miss Burney was at once classed among the first writers of fiction. "Evelina" was followed by a comedy, "The Witlings," which was never acted, nor even printed, and in 1782 appeared "Cecilia," which was a triumph. Three years after this she met the king and queen accidentally at the residence of a Mrs. Delany, in Windsor, an introduction that led to the offer of the vacant post of keeper of the queen's robes. This office crowded the next 5 years of Miss B.'s life with the most inane drudgery, and deprived her of all leisure and liberty for the exercise of her literary gifts. She resigned this post in the palace on account of her failing health, and not long after (1798) married Alexander Richard d'Arblay, a French artillery officer, a gentleman, but poor, whom the revolution had made an exile. In 1796 "Camilla" was published in 5 volumes, bringing the authoress a handsome sum of money, but no increase of fame. Ten years, from 1802 till 1812, she passed in Paris, her husband having given in his allegiance to Napoleon's government. At

the expiration of this term she returned alone to England and produced another novel in 5 volumes, "The Wanderer," a book that had little popularity, and is now almost forgotten. At the peace, her husband, now General d'Arblay, joined her, and remained with her till his death, at Bath, in 1818. Fourteen years after this event (1832) Mad. d'Arblay published in 8 volumes the memoirs of her father, the closing work of her long life, which ended when she was 87 years old. The literary fame of Mad. d'Arblay is allowed to rest upon "Evelina" and "Cecilia," her earliest works. Her diary, edited by her niece, though diffuse and garrulous, is very curious and entertaining. The memoirs of her father, written when she had lost the freshness and grace of her faithful style, are turgid and wearisome. As a novelist she is celebrated, and her works mark an era in the history of English fiction.

ARBOGA, an ancient town of Sweden, 65 miles west of Stockholm, on the Ulvison. It is famous for its beer, and has a considerable trade in leather, iron, copper, &c., which is carried on with Stockholm by the Arboga river and Mälar lake. Near Arboga is a once sacred grove and remains of Pagan worship.

ARBOGAST, or ARBOGASTES, a Gaul in the military service of the Romans during the latter half of the 4th century. In 888 he accompanied the emperor Theodosius on his expedition from Constantinople to Italy to support Valentinian II. against the usurper Maximus. After the revolt was reduced, Arbogast, by the order of Theodosius, remained with Valentinian as adviser. He exercised an absolute power over Valentinian, and when the latter attempted to recover his independence, Arbogast put to death all his partisans, and finally the emperor himself. Not daring to seize upon the imperial purple, he gave it to Eugenius, a distant relation of Valentinian, and a Roman patrician, going himself to Gaul to fight against Marcomir, chief of the Franks. Theodosius marched into Italy to avenge his cousin, and Arbogast and Eugenius met the imperial army in the passes of the Julian Alps, now a part of the Tyrol, where they fought a battle, in 894. Arbogast being defeated, escaped into the mountains and committed suicide.

ARBORICULTURE is a comparatively new term in the language of agriculture. It is derived from the Latin *arbor*, and *cultura*, and is employed to designate the modes of cultivating and perfecting trees, shrubs, and vines, for fruit-bearing, ornament, hedges, shelter, and artificial forests. Man has gradually improved the varieties of trees, learned their habits of growth, and their adaptation to given localities. Observed facts and principles—the results of investigation and experiment—have reduced tree-culture to a science, though not yet complete in its detail. The functions of various portions of a tree being understood, and its food-wants known, success in its culture may be secured. The science of vegetable anatomy

and physiology teach the following facts: 1. No tree can be perfected unless it have a good mechanical development of root, stem, branches, and leaves, early in life. 2. To produce these, the seed containing the tree in embryo must be derived from a healthy parent; the soil in which the seed is planted must contain the elements essential to the young tree, in a state fit for appropriation. 3. Soils varying in their physical or mechanical conditions, as to fineness of texture, porosity, aridity, and humidity, are adapted to various kinds of trees. 4. Man may vary these conditions so as to improve or injure trees for productiveness. 5. Certain portions or organs of a tree may be developed by pinching off shoots and buds, cutting back leaders and side branches.—Soils in their natural state produce trees adapted to their peculiarity of constitution. Thus, we have the wild crab, plum, peach, orange, and other kinds of trees, inhabiting localities where the soil and climate are exactly adapted to their wants. The cultivated varieties of fruit so acceptable to man, all sprang from wild ones. Some kinds of fruits growing wild are not benefited by culture, while the simple removal of others from uncultivated to tilled lands will cause a radical improvement. Seeds of wild trees, sown in rich soils, in good condition mechanically, will produce trees of an improved character, bearing fruit which yields a larger quantity of pulp than the wild tree, and generally of a better quality. The seeds of these, when sown under the most favorable conditions, will yield still finer fruit, until a certain point of excellence is attained, when the central energy of the tree being expended, it gradually returns to its original wild condition. When a good variety of fruit is obtained by culture, or by accidental discovery, it is multiplied indefinitely by the processes of grafting, layering, and budding. In this way have all our choice fruits been obtained, and finally perfected. The laws which have been unfolded by the sciences of vegetable physiology and anatomy, together with the established truths of improved culture, point to vast changes yet to be wrought in fruit production for man's benefit. By thorough attention to the selection of the best varieties of trees, and their culture, the product of an acre may be readily doubled, and even quadrupled.—In the practice of arboriculture, it should be remembered that the conditions which produced a given variety of fruit in its present perfection must be again established, to reproduce or continue it. Especial directions for tree-culture are given under the name of each kind of tree. The general principles, only, of arboriculture are as follows: I. *Situation*. This should be selected with reference to the kind of tree, its uses and habits. All trees liable to suffer from sudden frosts should be placed in cold exposures, so that the buds may remain dormant as late in the spring as is consistent with complete wood growth in early autumn. Fruit trees

should be little exposed to heavy blasts of wind, although a free circulation of air is to be desired.—II. *Soil*. For fruit trees, and for all other trees, except those of the pine and fir tribe, deep, rich loams, containing a fair share of lime, are preferred. Light sands, hungry gravels, and wet marsh lands, are alike unsuited to the development of hard wood, forest, and fruit trees. Calcareous loam soils are preferred for the apple, while the pear and plum delight in heavier clays. The quince and pear will bear moist soils, while the peach may be grown on light soils, though its highest development and greatest duration are only reached on strong loams. The pine and fir tribe grow well on poor, sandy, and gravelly lands, with shallow surface-soil.—III. *Preparation of soil*. For all trees, except those naturally growing on swamps, the soil should be freed from excessive supplies of water. It should be either naturally porous enough to allow falling water to filter rapidly through, and pass beyond the reach of tree roots, or be made so by thorough drainage. Water retained in the soil, preventing the plant from procuring its food, becomes sour, excludes the atmosphere, and otherwise obstructs plant growth. (See DRAINAGE.) It is true, under drains will be clogged with roots so soon as the trees growing above them attain any considerable size; but drainage and general porosity of soil will have become so thoroughly established before this period as seldom to require additional draining in after years. Thorough subsoiling will sometimes open cuts down to a porous subsoil, and thus establish good drainage without the absolute necessity of making regular drains. Open surface ditches will not suffice for lands planted to fruit trees, though they may answer for forests. Before planting out trees the soil should be thoroughly pulverized with the surface and subsoil ploughs. No hard pan should be allowed to exist within the usual range of tree roots.—Merely digging large holes will not fully answer, as the roots in extending meet with a compact mass of earth and become checked, producing more or less serious injury to the tree. The highest degree of perfection in the physical preparation of the soil can only be obtained by deep trenching. This is pursued extensively in Europe, where labor is cheap, and with us for grape vines and small fruit.—IV. *Manuring*. A soil deficient in materials required by growing trees, cannot support them unless the missing elements of their composition be added. As a general rule, to employ lands not well suited for the kind of tree to be planted, will prove too expensive for profit; hence soils are usually selected which require but partial manuring. If the soil be newly broken, or rather cold in its nature, half decomposed barn-yard manures, or composts of muck and manure, may be added in the autumn previous to ploughing the soil. By turning these deeply under, the soil will become improved by their decay. In no instance should long manures be brought in con-

tact with tree roots. The gases eliminated by decomposition will prove too concentrated, and thus destroy the delicate rootlets with which they may come in contact. Heavy dressings of lime and ashes may be profitably applied directly to all heavy lands, and those of a peaty character, no matter what kind of wood is to be grown. Light soils may receive these alkalis after they have been employed to decompose muck, peat, or forest earth—the whole mass being dressed over the surface of the soil and afterward ploughed under. The more thoroughly decomposed manures become before being added to the soil—provided their soluble elements are determined and properly divided—the better are they adapted to serve as food for trees. A fair proportion of decomposing vegetable matter should exist in every soil prepared for fruit trees; still this is by no means so essential as the insuring of a full supply of mineral elements; since trees, by means of their foliage, abstract the organic elements from the air.—*V. Transplanting.* Trees having attained sufficient size in the nursery, they are carefully lifted, all bruised roots and a portion of the root tap cut away with a sharp knife, the top and side branches cut back to balance injuries received by the roots. A moist day is the best for lifting and planting, but if a thick puddle be made with water and clay, or heavy loam, the tree roots dipped in it immediately after their removal from nursery rows, the planting may be done at any time with safety. The holes should be dug at least 8 feet wide and 2½ deep, loosening the bottom earth, and filling the hole with surface soil, decomposed turf, or good composts of earth and manure. Bones, old leather, or plastering, may be added with profit. This will furnish a magazine of food for a long time. Set the trees at about the same depth they stood at in the nursery, being careful to give every root plenty of room. Sprinkle fine earth over them, but do not shake the tree up and down, as this draws them out of place and finally leaves the roots crooked. For spring planting pour a pail or two of water in the half-filled hole to settle the earth among the roots, fill up the hole, and employ the poor subsoil taken from the bottom of the holes to replace the surface earth removed from about them; drive a strong limber stake into the ground near the tree, to which it may be attached by straw bands, cover the soil for a distance of 3 feet about the tree with hay, straw, leaves, litter, or spent tanbark, to prevent the rapid escape of water till the tree gets well established.—*VI. After-culture* consists in thoroughly cultivating the spaces between the trees, and growing some low, hoed crop to keep the soil in a free condition, being sure to add more manures than the crop can consume. Remove all dead wood and unnecessary branches, and keep the bark clean to prevent insects from lodging in it. The general principles given above will apply to forest and ornamental trees, except that they do not require manuring nor

so thorough culture, since they are less removed from a wild state.

ARBORIO, MEROURINO, known in history as the count di Gattinarva, born at Vercelli, in Piedmont, in 1465, died at Innsbruck in 1530. He was intended for the bar, and pursued a course of legal studies, which he resigned to embark in the more profitable career of a statesman. His first appearance in this character was as a member of the council of the duke of Savoy, in which capacity his excellent administrative talents attracted the attention of Margaret of Austria, who, in 1507, appointed him to preside over the parliament of her hereditary province of Burgundy. This may be considered as the commencement of his political advancement, as he was ever afterward intimately and conspicuously connected with the imperial court. In 1520, Charles V., upon his coronation at Aix la Chapelle, appointed him chancellor and member of his privy council. Thenceforth he enjoyed the entire confidence of the emperor, who consulted him in every emergency, and employed him to conduct many of the most delicate and difficult affairs of state. In 1529, he was the principal agent of Charles in concluding the treaty of Cambray, but he resolutely refused to affix his signature to that of Madrid, by which Francis I. was liberated, because he regarded it as dishonorable to the imperial cause. His ability and integrity were appreciated by Charles, over whom he exercised an exceedingly beneficial influence. He was always an advocate of lenient and conciliatory measures toward the Protestants, and was in the habit of citing the evil consequences of the rigorous measures embraced in the edict of Worms, in support of his policy. His moderation even inspired Luther and the other German reformers with the idea that he secretly sympathized with them, although he never publicly declared himself in favor of the reformation. So discreet and well-considered was his course, that in an age requiring a careful exercise of the highest qualities of a statesman, he enjoyed the esteem of all parties, without incurring suspicion or jealousy, or losing for a moment the confidence of the emperor or the pope. The latter offered him a cardinal's hat, which, notwithstanding his uneclesiastical training, he accepted, although he did not live long to wear it, having been carried off by an attack of the gout at Innsbruck, while accompanying the emperor to Augsburg. He enjoyed a great reputation for learning and eloquence, and apart from his celebrity as a statesman, was considered one of the most accomplished men of his time. Such was the opinion of his contemporaries, upon which we must rely almost entirely, as he has left little by which to judge of his abilities.

ARBRISSEL, ROBERT D', founder of the order of Fontevrault, born at Arbrissel, France, in 1047, died at Orsan in 1117. At the age of 27 he went to Paris to study theology, preparatory to entering the church, for which he had

been originally destined. In 1085, upon his appointment as vicar-general of the bishop of Rennes, he began to introduce some very sweeping reforms among the clergy and people of the diocese, which brought him into such bad odor, that upon the death of his superior in 1089, he was fain to retire to Angers, and give instructions in theology. At the expiration of 2 years, disgusted with the world, he retired into the forest of Oraou, on the frontiers of Anjou and Brittany, where he lived as a hermit, devoting himself to severe penances for his spiritual benefit. His example was contagious, and the neighboring forests of Anjou, Normandy, and Brittany, were soon filled with anchorets, who subsequently became members of the celebrated order of Fontevault. Finding himself surrounded by so large a number of disciples, Arbrissel founded, in 1096, the abbey of La Roe, of which he became the first prior, but soon relinquished this peaceful life to travel barefooted through the country, preaching repentance and penance to the people. He soon had several thousand followers of both sexes, for whose accommodation he built a number of abbeys, the most celebrated of which is that of Fontevault, near Poitiers, established about the year 1100. The remainder of his life was spent in similar occupations. He is said to have undergone the most extraordinary trials, to enable himself to resist any possible temptation.

ARBUCKLE, JAMES, a Scottish poet who lived in the first half of the 18th century. He published at Edinburgh a poem called "Snuff;" in London, a "Letter to the Earl of Addington on the Death of Joseph Addison;" "Glotta," a poem dedicated to the marchioness of Carnarvon, by a student of the university of Glasgow; "Hibernic Letters," London, 1729, and some fugitive verses in the "Edinburgh Miscellany."

ARBUCKLE, MATTHEW, brevet brigadier-general in the United States army, was born in Greenbrier co., Va., about 1775, and died June 11, 1851. He at different times commanded at New Orleans, Fort Gibson, and Fort Smith, and was in several engagements during the war with Mexico. Much of his life was passed among the Indians, who placed implicit confidence in him. At the time of his death he commanded the 7th army department.

ARBUTHNOT, ALEXANDER, a Scottish theologian, lawyer, historian, and poet, born in 1588, died 1588. He was the author of a "History of Scotland," of too republican a tendency to be pleasing to Scottish royalty. While the reformation was embroiling every public and private relation in Scotland, Arbuthnot wrote poetry. "The Praises of Women," and "The Miseries of a Poor Scholar," were the fruits of his contemplations in a most stormy period. In his youth, Alexander Arbuthnot studied jurisprudence in France; and in 1572 he published in Edinburgh his *Orationes de origine et dignitate Juris*.

ARBUTHNOT, JOHN, M. D., the son of a

Scottish Presbyterian clergyman, and one of the constellation of wits in the reign of Queen Anne, born in Kincardineshire, Scotland, about 1675, died in London, Feb. 27, 1735. He was educated at the university of Aberdeen, where he studied physic and took his doctor's degree. His father, by refusing to comply with the Presbyterian system introduced at the revolution, was deprived of his preferment, and young Arbuthnot therefore went to seek his fortune abroad. He repaired to London, where he supported himself for a while by teaching mathematics. He made his first literary venture in 1695 in a critical essay entitled an "Examination of Dr. Woodward's Account of the Deluge," in which he aimed to show that a universal deluge was inconsistent with philosophical truth. This work excited much curiosity, and the reputation which it gave the author was considerably heightened in 1700 by his "Essay on the Usefulness of Mathematical Learning." He now began to practise as a physician, and quickly attained a high position in the profession, his witty conversation and agreeable manners often, it was said, being quite as serviceable as his prescriptions. In 1704 he contributed to the royal society a paper concerning the regularity of the birth of both sexes, in which he demonstrated the fact from authentic statistics, and deduced from it arguments against polygamy, and for the existence of divine providence. This paper procured his election into that body. In 1709 he was appointed the queen's physician in ordinary, and the next year was admitted a member of the royal college of physicians. During the ascendancy of the tory party he held a lucrative and honorable position, and lived in constant intercourse with the chief literary men of the time, with Pope, Swift, Gay, Parnell, Gray, and Prior, in which brilliant circle he was unequalled for learning and unsurpassed for wit. In 1712 he wrote the "History of John Bull," a political allegory, full of happy satirical allusions, and designed to ridicule the duke of Marlborough, and to render the war unpopular. It is the most durable monument of his fame, and one of the best humorous compositions in the English language. Some of its allusions which are difficult to understand at present have been admirably illustrated by Sir Walter Scott in his edition of Swift's Works. He formed in 1714, in conjunction with Swift and Pope, the plan of writing a satire on the abuse of human learning in every branch. The design was to be executed by the combined labors of this illustrious triumvirate, in the humorous manner of Cervantes, under the history of feigned adventures. "Polite letters," says Warburton, "never lost more than in the defeat of this scheme." It was frustrated by the death of Queen Anne, by which Arbuthnot, who had been her favorite physician, lost his place, and a serious blow was given to all the political friends of the associated wits. In the dejection which followed, and by reason of the

growing infirmities of Swift, the design was never carried further than an imperfect essay, written chiefly by Arbuthnot, under the title of the "First Book of the Memoirs of Martinus Scriblerus." This fragment of satire, though sometimes directed against phantoms of absurdity, and fabulous rather than familiar follies, is yet an original and most witty performance. Dr. Arbuthnot visited Paris immediately after the death of the queen, and on his return changed his apartments from St. James's to Dover street, and continued his literary occupations and his practice of physic. In 1717 he and Pope gave assistance to Gay in a farce entitled "Three Hours after Marriage," and it is remarkable that the production of their joint wits was condemned the first night. The failure is explained in part by the peculiar character of Arbuthnot's humor, which was something too refined and rare, and too much associated with matters of learning, to be generally appreciated. In 1728 he was chosen second censor of the royal college of physicians, and in 1727 was made an elect of the college, and pronounced the Harveian oration. In the same year also appeared his learned work, and the most valuable of his serious performances, entitled "Tables of Ancient Coins, Weights, and Measures." He continued to divert his leisure hours by writing humorous papers, one of the most remarkable and dignified of which was an epitaph upon the infamous Col. Charteris. In 1732 he contributed to detecting and punishing the impositions and abuses carried on under the specious name of the "Charitable Corporation," and shortly afterward published his essays concerning the "Nature and Choice of Aliments," and the "Effects of Air on Human Bodies." The state of his own health doubtless led to his selection of these topics. He was living in great debility at Hampstead, and failing to obtain relief, returned but a short time before his death to London. His last humorous work was an entertaining and scholarlike paper on the "Altercation, or Scolding of the Ancients." The amiability of the character of Arbuthnot is seen in the fact that he retained uninterruptedly the precarious friendship of such men as Pope and Swift. Swift said of him, that "he had more wit than we all have, and more humanity than wit." His letters reveal at once his manliness and his tenderness, and he was in his time equally admired for his virtues and his accomplishments. His writings, of which he seldom spoke, and in which, after their publication, he seemed to take no interest, are so blended with those of his confederates that they are not easily distinguished. Though the lapse of time has made the humor of them less palpable than formerly, they are still read, and will always furnish delight to the more meditative and serious class of the lovers of wit.

ARBUTUS, a genus of evergreen shrubs belonging to the natural order *Ericaceae*. Its fruit is a berry containing many seeds. The most

remarkable species of this genus, is the arbutus of Virgil, called the *A. unedo*, or the "strawberry tree;" the berries of which bear a strong resemblance to the common strawberry. It is a native of the south of Europe and the Levant. In northern Europe it is a hardy evergreen, sometimes attaining to a height of 20 feet, bearing greenish-yellow blossoms in October and November, and bright yellow and red berries in November and the following months. At the lake of Killarney in Ireland, there are beautiful groves of this species of arbutus, which give a charming aspect to the country. Its berries are hardly eatable, and, if eaten freely, are apt to produce stupefaction. In Corsica, a pleasant wine is said to be prepared from them. Its bark and leaves are astringent. The oriental arbutus, or *A. andrachne*, is a native of the Levant, and has similar narcotic qualities. It is superior in beauty, but much less hardy in cold climates, not bearing fruit in northern Europe. Its leaves are broader and less serrated; its bark peels off so as to leave the stem always smooth, and of a clear bright cinnamon-brown color. The mule arbutus, or *A. hybrida*, apparently a cross between these two, has great beauty of foliage, and in moderately cold regions, grows well, but does not bear berries in northern Europe. *A. procera* is a native of California, cultivated as an ornamental evergreen in the gardens of Great Britain.

ARO, the name of any portion of a curved line; thus, an arc of a circle is a portion of the circumference. To rectify an arc, is to give the length of the straight line to which it would be equal if it were made to have the same length in a right direction which it now has in a curved. Two arcs are said to be equal, when, being rectified, they have the same length; and similar, when, being taken from different circles, they have the same number of degrees—that is, are equal fractions of their respective circumferences. The arcs of a circle serve to measure the angles; for from the point of the angle as a centre, with whatever radius, let a circumference be described; then the number of degrees of the arc intercepted between the two lines which form the angle will be the measure of the angle. Thus, as the arc of 90° corresponds to a right angle, if we find that the intercepted arc contains 15°, we conclude that the angle corresponds to a right angle, as 15° to 90°, or that it is the 6th part of a right angle. The chord of an arc is the right line which joins its extremities, and a segment is the area included between an arc and its chord.

ARO, JOAN OF (JEANNE D'ARO), known as the "Maid of Orleans," a celebrated heroine of France. She was born Jan. 6, 1410, in the village of Domremy in Lorraine, of poor but decent and pious parents. The true orthography of the name is D'ARO. She was their 5th child, and, owing to the indigence of her father, received no instruction, but was accustomed to out-of-door duties, such as the tending

of sheep and the riding of horses to and from the watering-place. The neighborhood of Domremy abounded in superstitions, and at the same time sympathized with the Orleans party in the divisions which rent the kingdom of France. Jeanne shared both in the political excitement and the religious enthusiasm; imaginative and devout, she loved to meditate on the legends of the Virgin, and especially, it seems, dwelt upon a current prophecy that a virgin should relieve France of her enemies. At the age of 18 she began to believe herself the subject of supernatural visitations, spoke of voices that she heard and visions that she saw; and, at 18, was possessed by the idea that she was called to deliver her country and crown her king. An outrage upon her native village by some roving Burgundians raised this belief to a purpose; her "voices" importuned her to enter upon her mission by applying to Baudricourt, governor of Vaucouleurs; and this, by the aid of an uncle, she did in May 1428. The governor, after some delay, granted her an audience, but treated her pretensions with such scorn that she returned to her uncle. The fortunes of the dauphin, however, were desperate, and Baudricourt, pressed by her entreaties, sent her to Chinon, where Charles held his court. Introduced into a crowd of courtiers from whom the king was undistinguished, she is said to have singled him out at once. Her claims were submitted to a severe scrutiny. She was handed over to an ecclesiastical commission; she was sent to Poitiers for examination by the several faculties in the famous university there. No evidence indicating that she was a dealer in the black art, and the fact of her virginity removing all suspicions of her being under satanic influence, her wish to lead the army of her king was granted. A suit of armor was made for her, a consecrated sword which she described as buried in the church of St. Catharine at Fierbois, and which she perhaps had seen while visiting among the ecclesiastics there, was brought and placed in her hands. Thus equipped, she put herself at the head of 10,000 troops under the generalship of Dunois, threw herself upon the English who were besieging Orleans, routed them, and in a week forced them to raise the siege. Other exploits followed. The presence of the virgin with her consecrated banner struck a panic into the souls of her enemies. In 8 months Charles was crowned king at Rheims, the maid of Orleans standing in full armor at his side. Her promised work was done. Dunois, however, unwilling to lose her influence, urged her to remain with the army, and she did so; but her victories were over. In an attack on Paris in the early winter (1429) she was repulsed and wounded. In the spring of the next year she threw herself into Compiègne, then beleaguered by the English; made a sortie in which she was taken prisoner (May 23, 1430), and was at once carried to the duc de Luxembourg's fortress at Beaufort. An attempt to escape

by leaping from a dungeon wall was unsuccessful, and she was taken to Rouen. The university of Paris demanded that she should be tried on a charge of sorcery, and solicited letters patent from the king of England, which were reluctantly granted. The chapter at Rouen were rather favorably disposed toward her. Many of the English in authority were unwilling to proceed to extremities. But the university at Paris prevailed; the examination lasted several months, and resulted in a conviction of sorcery. The papers were sent from Rouen to Paris, and the verdict of the university was unanimous that such acts and sentiments as hers were diabolical, and merited the punishment of fire. Sentence of condemnation was read to her publicly on a scaffold by the bishop of Beauvais, and the alternative offered of submission to the church, or, the stake. The terrified girl murmured a recantation, put her mark to a confession, and was taken back to prison. Here she heard her "voices" again; her visions returned. A man's apparel being left in her cell to tempt her, she put it on; the bishop of Beauvais seized upon the act as a virtual relapse into her old unbelief, and hastened the execution of the first sentence. A huge pile of wood was erected in the market-place of Rouen, and, surrounded by a vast assembly of soldiers and ecclesiastics, Joan of Arc was burned on the last day of May, 1431. The Seine carried her ashes to the sea. The infamy of this transaction lies heavily upon all concerned in it: upon the Burgundians who gave her up; upon the English who allowed her execution; upon the French who did the deed, and the French who would not prevent it, and upon the king who did nothing to avenge her—who waited 10 years before he reversed the process by which she was condemned, pronouncing her "a martyr to her religion, her country, and her king." The character of the "Maid of Orleans" was spotless. She was distinguished for her purity, innocence, and modesty. Her hand never shed blood. The gentle dignity of her bearing impressed all who knew her, and restrained the brutality of her soldiers. In 1855 M. Delapierre, in a little book, suggested doubts in regard to the fate of *La Pucelle*, arguing that another person was burned in her stead. But the papers he used are not believed to be authentic, nor has his argument caused any change in the accepted record of history.

ARCADE, an aperture in a wall with an arched head. This term is also applied to a range of apertures with arched heads forming one of the most beautiful objects attached to the buildings of a city which architecture affords. The arches of arcades are generally supported upon square pillars, and are sometimes employed instead of colonnades to form porticoes, and though they are not so beautiful perhaps, they are stronger, more solid, and less expensive. In a range of arcades, the utmost care should be taken that the piers be suffi-

ciently strong to resist the pressure of the arches, particularly the piers at the extremities, for they alone support the whole. The lateral pressure upon the extreme piers in the range will be equal to that on the piers of a single arcade, and all the intermediate piers will be without such lateral pressure; for the lateral pressures of any two adjoining arches upon the intermediate pier are equal, and being opposite they destroy each other's effect; but the extreme pier having only one adjoining arch, must be sufficiently strong to withstand the horizontal thrust of that arch. The greater the weight or vertical pressure put upon the extreme piers, the more will these piers be able to counteract the thrust of the adjoining arch, consequently if each extreme pier have to support a wall, the higher the wall the less dimensions the pier requires. It is upon this principle that the slender pillars dividing the nave on either side from the aisle in churches of the Saxon and pointed styles of architecture, are capable of withstanding the horizontal thrusts of the groins; for if the insisting wall were taken away, the pillars of most of these buildings would not be able to withstand the thrusts of the arches. Arcades were employed in triumphal arches, theatres, amphitheatres, and aqueducts, by the Romans, and frequently in their temples; toward the decline of the empire the intercolumns were formed into arcades. They may be used with propriety in the gates of cities, palaces, gardens, and parks; they are much employed in the piazzas or squares of Italian cities, and are of great use in affording shade and shelter in hot and rainy climates. There are various methods of decorating the piers of arcades, as with rustics, columns, pilasters, caryatides, Persians, or terms surmounted with appropriate entablatures. Sometimes the piers are so broad as to admit of niches between the columns or pilasters. In some instances the arches of arcades are supported entirely by single or coupled columns, without the entablature, as in the temple of Faunus, at Rome. This form is far from being agreeable to the eye, and it wants stability, as the columns would be incapable of resisting the lateral pressure of the arches were they not tied together by a circular wall.

ARCADIA, an inland, central, and mountainous country of the Peloponnesus, or Morea, and, next to Laconia, the largest of its provinces. It never, however, played a part in the affairs of Greece, in anywise such as might have been expected from the size of its territories, or the admitted bravery of its people. This is ascribable chiefly to the nature of the country, and to the character induced thereby on its people. It had no sea-shores, and no navigable rivers, consequently no commerce, and, it seems, few manufactures. It consists, in fact, of a great elevated mountain bowl, surrounded on the north, east, and south by towering chains of rocky heights, and internally broken into numerous valleys, divided

by mountain ridges, on which the snow was wont to lie, as on the upland plains of Mantinea, and Tegea, when the violets were in bloom and the sunshine warm in the low country of Argos, scarce one day's journey distant. To the west, whither it trended as its water-shed, all its tributary streams from its highland gorges falling into the river Alpheus, it was of milder climate and more fruitful soil.—Yet, for all this, Arcadia had its advantages of soil, of scenery, of climate. Alone of Greece, its mountains were not barren, its pastures bare and sun-burned, or its rivers dry, stony water-courses, in the summer time. Magnificent, evergreen mountain sides, innumerable brooks, one more delightful than the other, pastures where the vegetation is never sere, coolness, and shade, and moisture everywhere, abundant verdure, and never-failing springs for the flocks and herds, which constituted her greatest wealth—these were her delights and riches, delights and riches of no small weight, in a parched and arid country, such as Greece is in her general aspect. Her people, who were of the Doric race, and that of the simplest and rudest form, adopted from the first, and maintained to the last, a pastoral life, but a pastoral life widely different from that misrepresented by the Daphnis and Chloe, Doris and Strephon, of the cockney poets, whose best idea of Taygetus was Richmond Hill, of Alpheus the New river. In the Messenian wars, in that intermediate time between the heroic and historic ages, Arcadia seems to have played a more conspicuous part than she did at any subsequent period; she was at that time, like the rest of Greece, monarchical in form of government, and with the rest became republican, and so continued until she was merged in the Roman empire.—Mantinea, Tegea, and Orchomenus were the largest cities of Arcadia, but it cannot be said that they were of much importance, except from their mutual strifes and dissensions, which injured the prosperity of the country more than their wealth, or energy, or enterprise advanced it. In many respects the Arcadians closely resembled the Swiss; in their love of independent mountain life; in their love of freedom; in their love of money; in their willingness to sell their swords to foreign countries. Their country was never conquered. Their heavy-armed infantry was second to none in Greece. Hunters, herdsmen, and musicians, they served the god Pan in their mountains, and cared not for the life of cities. The Arcadians were the Swiss guards of the Asiatic despots; and, where they had taken pay from the barbarian, they served him faithfully to the last, even against their own countrymen, and died for him, as they did at the battle of Issus, where 80,000 mercenaries of the Peloponnesus were slain in the army of Darius, by Alexander. In the Persian, and Peloponnesian wars, the Arcadians, especially the Tegeans, acted principally with the Lacedæmonians. At Plataea, in the great final battle against Mardonius, the Arca-

dians were above 2,000 strong, 1,500 from Tegea, and 600 from Orchomenus, who all did good service. In the celebrated expedition of the younger Cyrus against Artaxerxes, which led to Xenophon's retreat of the 10,000, there were 2,800 heavy Arcadian infantry, and many of the best officers were of that nation. In the social wars which followed, Arcadia was divided against herself, part with the Tegeans, who had fought in the Spartan contingent at Plataea, taking side with the Argives and Achaeans, while the Mantineans espoused the party of Lacedaemon. At the battle of Mantinea, where Epaminondas fell, but in falling beat down the pride of Sparta, never to rise again, the Arcadians fought on both sides, and on both suffered severely, though mostly on that of the Spartans, who were utterly defeated. After this, the Arcadians became confederates in the Achaean league, and fell under the Roman power. Thenceforth they have no separate history from that of the empire, and of Greece of the middle ages, and of modern days. —Arcadia, though she produced some good soldiers, has left no name of note, worthy to be recorded. She has left nothing in arts, nothing in letters, to illustrate her records, and certainly seems more obnoxious to the charge of national dullness than Boeotia, which, at least, gave birth to Pindar and Epaminondas.

ARCADIUS, the first of the Byzantine emperors, born in Spain A. D. 388, died at Constantinople, May 1, 408, was the first son of Theodosius the Great, the last ruler of the whole Roman empire. In 395, a few months before his death, Theodosius divided the empire between his two sons, Arcadius and Honorius, giving to the former the eastern part, extending from the Adriatic on the west to the Tigris on the east, and from Scythia on the north to Ethiopia on the south. Arcadius ruled under the regency of Rufinus; but in the first year that individual was assassinated by the emissaries of Stillicon, who pretended to the regency of the empire. Eutropius, a eunuch, had become regent of Arcadius and held the place till 397, when Trigibildas, a Gothic chief, in Phrygia, revolted, and compelled Arcadius to put his favorite to death. Trigibildas and his tribe also obtained permission to pass the Bosphorus and settle on the European side; but their Arianism roused the ire of St. Chrysostom, who stirred up against them the people of Constantinople, by whom they were attacked and massacred, or driven out. Hereupon, the Empress Eudoxia, who had now acquired the absolute control over her husband, caused Chrysostom to be banished to Comana, where he died A. D. 407. Arcadius was a feeble man, but of severe religious orthodoxy.

ARCANI DISCIPLINA, the name given to the practice of the early church of withdrawing from public view the sacraments and higher mysteries of the Christian service. The worship of the temple, as described in the Old Testament, was the model to which the early

Christian assemblies, as far as they could, conformed their worship. In accordance with the spirit of the times, and perhaps also as a matter of necessity, the Lord's Supper was administered near the close of the 2d century as a Christian mystery, with the view of investing it with increased sanctity by its secrecy; and by this means a mysterious character was imparted to many of the usages and forms of the church. These secret usages did not receive, till after the reformation, the name of *arcani disciplina*, and they then played an important part in controversy, the Roman Catholics referring to them to prove that certain dogmas and customs were possibly of apostolic origin, though their existence in the early ages of the church could not be historically shown.

ARCANO, MAURO or GIOVANNI, an Italian satirical poet, born in 1490, died in 1586. He came to Rome while a young man, and after serving in several noble families, became attached to the person of the cardinal Cesarini, with whom he remained a number of years, during which he accompanied him on his extensive travels. Arcano was a bold, vigorous, and successful writer. Unsparring in his satire, he ridiculed every folly of the age, but with a coarseness and license which his broad humor cannot always redeem. His style is altogether original, and although not ranked among the great poets, he was held in much esteem by his contemporaries. The *Capitoli* contain the greater part of his satirical poems.

ARCANUM, a Latin word, meaning a secret, and applied principally to the operations of alchemists or druggists. Colloquially we speak of the arcana of a profession or trade as equivalent to its mysteries.

● ARCE, MANUEL JOSÉ, a Guatemalan general, who toward the end of 1824 succeeded Pedro Molina as president of the new republic of Central America. He was the first constitutional president, elected for 4 years with a salary of \$10,000, but not long after the convocation of the first congress, March 5, 1825, it became evident that the national rejoicings which greeted his advent were soon to give place to feelings of discontent. The first discordant element was introduced by the intrigues of the old Spanish, aristocratic, clerical party, to which the president belonged, and which, with the bishop of Leon as chief spokesman, protested against the act of the new congress that subjected the clergy and the other privileged classes to taxes, from which, under the rule of Spain, they had been exonerated. The labors of the congress of 1825 and 1826 were however brought to a successful close, the constitution of 1824 adopted, the country put into a position calculated to secure prosperity within and to protect it from attack from abroad, and spite of the political dissensions, the affairs of Central America proceeded smoothly enough until Sept. 6, 1826, when, at the bidding of the clergy, the president resorted to the arrest of Barrundia, governor of Guatemala, which

created much excitement all over the country, especially in the province of Quetzaltenango, where the population rose to arms in October. This insurrection, although it was promptly quelled by the president, became the forerunner of similar popular movements in Honduras and Nicaragua. There the people revolted against the authority of Arce and declared their independence. In order to devise measures for the purpose of allaying the crisis, an extra session was convoked by the president in Nov., but party spirit ran higher than ever, and the politicians, availing themselves of the general excitement, frustrated all attempts of the executive to restore peace to the distracted country, and the congress broke up in the greatest confusion. This became the signal for civil war, which in 1827 raged with great violence between the provinces of San Salvador and Guatemala, and the president, who commanded in person the army against the rebels, was repeatedly defeated at Apopa and Santa Anna. A truce was at length agreed upon in Jan. 1829, but a new and powerful champion of the democratic party who had arisen in the person of General Francisco Morazan, rekindled the revolutionary spirit of the Central American liberals, broke the truce, took possession of the capital, Guatemala, on April 18, and after securing the person and the property of the president, the vice president, Mariano Petronena, the members of the cabinet, the principal prelates, and of about 80 more leading individuals of the same party, nominated Barrundia as provisional president, and subsequently assumed the reins of power himself, under the sanction and applause of the people, while Arce was expelled from the country, together with the archbishop and many of the superior clergy, whom he had chiefly to thank for his ruin.

ARCESILAUS, founder of the New Academy, lived in the latter part of the 8d century. He was a native of Pitane, in Æolia, and was originally intended for a rhetorician, but while pursuing his studies at Athens, became so enamored of philosophy that he determined to devote himself to it altogether. He did not however confine himself to any one school, but studied all the various systems. He was a wit, a poet, and an accomplished orator, as well as a grave philosopher. He was not rich, and yet could afford out of his limited means to be generous to the needy. His enemies, however, charged him with being a voluptuary and a wine-bibber. He was the successor of Orantor, in the chair of the academy of Athens. As he wrote nothing, his opinions were understood imperfectly even by his contemporaries, and are known to us only through the partial and unfair statements of his opponents. But he was not a skeptic in the Pyrrhonic sense of that term, and his celebrated saying, "that he knew nothing, not even his own ignorance," may have been uttered to indicate his humility and diffidence rather than his infidelity. He certainly did not doubt the existence of truth,

nor did he deny the existence of an internal moral monitor, though he may have regarded that monitor as a very fallible guide. In nothing, however, was Arcesilans more distinguished from the pure Pyrrhonists, than in his predilection for questions appertaining to practical life, and in the undeviating moderation of his tone. He is said to have revived the Socratic method of teaching, and to have cleansed the doctrine of Plato from those impurities with which they had become intermingled after the death of that great philosopher.

ARCH (Lat. *arcus*, a bow), a curved structure supported by its own curve. The length of an arch is much less than its width, as is the case with the arch forming the roof of a door or of a window. When such a structure is long, it is called a vault. However, the quantity of light admitted and of weight supported, either apparent or real, has an influence upon the name adopted. For example, we say the arch of a bridge, and a triumphal arch, because both are above ground and support nothing, and we see the light through and around them; while the same arches, if used for a tunnel in a deep trench, or for a passage between two cellars, would be called vaults. It is supposed that domes were unknown to the Egyptians and the Greeks, the first arched monument on record being the *cloaca maxima* built in the age of the Tarquins. The original Etruscan dome was supported by a few pillars, under which stood the augurs; the object was to protect the priest against the sun and rain, and at the same time allow him to study the horizon and be seen by the people. The Romans scarcely deviated from the semicircle, which is the simplest form of the arch, and, in building it, did not follow true mechanical principles, so that the great strength of their numerous aqueducts, viaducts, and monuments is to be ascribed to their massiveness and to the good cement employed. It was not till the middle ages that the arch was properly built and widely used. At that period, the Christians and the Saracens vied with each other in giving beauty to their temples, and their architects, under the double impulse of religious and of artistic ideas, made architecture a science. By means of the arch, these masters succeeded in building structures of unrivalled beauty with materials which would have been rejected by the Roman architects as utterly worthless. They invented the pointed arch, shaped and ornamented it in a thousand ways, making it seem strong or airy according to its use and the effects of light. Strong abutments are generally found around the monuments of that period, which consist of a succession of arches built, one above the other, from the ground to the top of the monument, the upmost one being used as an aqueduct for the roof-gutters, appearing, from below, as light as if made of tin plate. The roofs of many of these edifices are formed of large arches as main ribs, which sustain smaller arches abutting on them; they are as slender as possible, and so appropriately

shaped and ornamented as to appear a hundred times lighter than they are. The wedge-shaped stones of which an arch is composed are called *voussoirs*; the uppermost is the key stone; the two blocks of masonry on which the arch rests are the abutments; the line from which the arch springs is called *impost*; the inner curve, *intrados* or *soffit*; the curve outside the *voussoirs*, *extrados*; the span is the distance between the piers; the distance of the keystone above the impost is the height of the arch. The names of the parts of the arch proper are, the springs of the arch, the haunches, and the crown. When the arch has only to support itself, each *voussoir* sustains the weight of those placed above it, and, consequently, they must be made larger and larger from the crown to the spring; but when the arch has to support weights, the various modes in which they may be disposed require as many different constructions, and the finding of the resulting force acting on each part, is one of the most difficult tasks of the architect, especially as the methods of accomplishing it are among the least definite of the art of engineering. The use of arches in the form of an arc smaller than a semicircle is quite modern, and superior, for many purposes, to older forms. In bridges, for example, it leaves, in ordinary times, a larger passage for boats, and in times of freshet, offers less resistance to the water, and the bridge runs less risk of being carried down. Since the introduction of cast-iron in architecture, arches of that metal and of a single piece have been built; in such cases the arch is used only to please the sight, as the solidity of the structure depends entirely on other portions of the work.—A TRIUMPHAL ARCH is a monumental structure erected in honor of some celebrated person and his deeds, or to commemorate some great event. They probably originated with the Romans, and Stertinius is the first recorded who erected such a monument. Two were built by him, one about 196 B. C. in the Forum Boarium, and another in the Circus Maximus. In the year 193 B. C., Scipio Africanus built one on the Clivus Capitolinus, and in 121 B. C., Fabius Maximus erected one on the Via Sacra. Of these, none remain. Different writers record 21 as having been built in the city of Rome.—The most celebrated of Roman arches are those of Augustus at Rimini, of Trajan at Beneventum and Ancona; and those of Titus, Drusus, Septimius Severus, and Constantine at Rome. That of Titus is one of the best. It is situated at the foot of the Palatine, and was probably completed after his death and apotheosis, as in the inscription he is called *Divus*. It commemorates his conquest of Judea. On the inner sides of the arch are two basso-relievs; one exhibiting the emperor in his car drawn by 4 horses, with liotors attending; victory following, in her left hand a branch of palm, and in her right a crown of laurel over his head. The horses are led by a figure representing Rome with armor, and followed by magistrates; the other basso-ri-

lievo represents the table of shew-bread, the golden candlesticks of 7 branches, tables of the law, ark of the covenant, and other spoils brought from Jerusalem. Remains of Roman arches are to be seen in Spain, Greece, and other countries. The custom of raising magnificent triumphal arches began under the first emperors.—During the republic, arches were decreed to victorious generals, but not to the dead. When Augustus was emperor, the senate proposed to have one built in honor of Drusus Nero, who died in Germany. Augustus consented, and a marble arch was constructed on the Appian Way. In modern Italy there is one of Alfonso in Naples, and one in Berlin at the entrance of the palace. But Paris, of all modern cities, has the greatest number and the most beautiful. The Portes St. Denis and St. Martin were erected in 1678-'74; the arc du Carrousel in the years 1806-'9, in honor of the armies of France. It is at the west entrance of the Tuileries; its height is 47 feet, its breadth 55. Its two principal faces have each 8 Corinthian columns, surmounted by statues. The most magnificent is the arc d'Etoile, at the extremity of the avenue des Champs Elysées, built for the purpose of commemorating the victories of Napoleon. It was commenced in 1806, but not completed until after the revolution of 1830. It is in the form of a parallelogram, its height and breadth being each 150 feet. It has 8 arches, the centre one 95 feet, and the side arches each 52 feet in height. On the eastern and western fronts are colossal groups in relief, and also on the frieze. The arch at Hyde Park corner with the equestrian statue of the duke of Wellington, and Cumberland gate, are the only specimens in England. In China they are numerous. It has been computed that their number is as great as 1,100, of which 200 are very beautiful. They are situated, not only in the cities, but on eminences along the roads running through the empire. Some few of the less beautiful are in honor of distinguished females.

ARCHÆOLOGY, the science of antiquities, properly commences with that branch of geology known as paleontology. Organic remains attracted the attention of philosophers 500 years B. C.; but until the middle of the 17th century they had not decided whether fossils were the "sports of nature," or relics of once living beings, and some gravely maintained that the petrified bones of elephants were those of fallen angels. It was reserved for Cuvier and his successors to unroll the volume of nature rich with the relics of primeval ages, and enable the archaeologist to commence his studies with a knowledge of the forms and characteristics of the inhabitants of the preadamite and antediluvian world. With the period subsequent to the deluge begins the special province of archaeology, to trace through the primitive arts the history of civilization and social development of man.—During the ages of barbarism men were comparatively isolated from each other. Their weapons, uten-

sils, and ornaments, were few, and formed of wood, bone, and stone, which each carved out for himself. The use of metals was the first step in civilization. These materials afforded ample room for development of skill in workmanship, and hence new tastes and arts were formed. The supply was limited both as to quantity and locality; this necessitated a system of barter, the beginning of trade. Gold was probably the first metal wrought, on account of its attractiveness and superficial deposit. Tin and copper must have been used at a very early period in Great Britain. Here were the materials for brass and bronze. The skill for combining them was soon imported from Egypt. The intercourse between these nations is spoken of by Herodotus and Polybius, and their accounts confirmed by the bronze relics of similar shape found in both countries. Greece probably acted as a medium of communication. This is inferred from several circumstances, among others the fact that the leaf-shaped swords depicted upon Grecian vases appear to be accurate representations of those used by the ancient Britons, and the nations of northern Europe. The Greeks attained great perfection in metallurgic arts. Homer describes coats of mail, goblets, tripods, &c., on which figures were represented. Considerable progress must have been made in working metals before iron became in much use. The Romans were early workers in this metal; so also were Celtic and Germanic tribes, from one of whom, the Norci, some have supposed they derived their knowledge of steel. It is more probable that they owed this metal to Egypt or Assyria. Written language was contemporaneous with metallurgic art. Hieroglyphics probably belong to the age of copper, enchorial writing to that of iron. This branch of archæology must be studied under the heads of ethnography and paleography.—Numismatics is a branch of archæology valuable in illustrating history. Plutarch was the first who thus applied it. By the aid of coins and medals, dates can be determined, series of kings traced, weights and currencies ascertained, progress in art noted, &c. As an illustration we may refer to the literary history of the two books of Maccabees. These books are the only historical link between the old and new dispensations, the only record of the fulfilment of the promises which foretold the restoration and continuation of the Jewish sceptre till the Messiah should come. Owing to the discrepancies between their chronology and that of classic history, they were rejected as non-authentic until Erasmus Fröhlich tested their accounts by the contemporary and indisputable evidence of medals, and established their truth and accuracy.—Heraldry is another trustworthy aid which archæology offers to history. Its symbolic records supply a vast amount of collateral evidence.—Archæology has revealed much that is interesting respecting the ceramic art, or pottery. Dibutades of Sicyon has been supposed

to have been the inventor of modelling in terracotta; Coræus of Athens, of pottery; Talus, nephew of Dædalus, of the potter's wheel; but although the potters of Corinth, Ægina, Samos, and Athens, did much to perfect their art, yet they must yield the honor of their inventions to the Egyptians and Phœnicians.—Glass, according to Pliny, was accidentally discovered by some Phœnicians. Bernard Palissy attributes it to the Israelites. It is tolerably certain that the first manufactories were in Egypt. It was thence introduced into Sicily and Etruria, and from this latter country the Romans probably derived their knowledge of it. Large quantities of glass vessels have been found in the catacombs, exhibiting proof of much skill in painting and staining. The celebrated Portland vase shows the perfection to which this art was carried. This is composed of 2 layers of glass, representing white figures sculptured in relief upon a blue ground, and is so perfect an imitation of an onyx cameo, that for a long time even the most scientific were deceived. From Egypt and the adjacent countries are derived the earliest specimens of engraving, not only upon metals, but upon glass and gems. These last were principally used for signet rings. Every Babylonian, according to Herodotus, had his signet; so also had the Egyptians, for each one sealed his own sacrifice. The Etruscans, who were very fond of personal ornament, derived much of their skill, both in design and execution, from the Babylonio-Phœnician artists. In Micali's engravings there is a collection of buckles, diadems, necklaces, rings, &c.; some very large and adorned with engraved lions, birds, sphinxes, and combatants; the designs show their foreign origin, the setting is Etruscan. All departments of ancient art, all relics of by-gone ages, even when apparently slight and trivial, are to the archæologist full of light, illuminating the dark records of the past, and bringing into full relief events which else had been buried in oblivion, or verifying annals which have been cast aside. A case in point is Manetho's chronicle of the kings of Egypt, which he compiled from the records of the temple of Heliopolis in the time of Ptolemy Philadelphus. His history, until lately, was rejected as a tissue of fables, but the translations of Egyptian hieroglyphics within a few years, have corroborated his statements as more to be relied on than even those of Herodotus.—Two truths are taught by archæology: one, that no nation is self-made, and that international intercourse is absolutely necessary for the development of art and civilization; the other, that art and civilization originated in the East. This is contrary to the theory of art historians of the last century, who claimed for Greece the most absolute originality of conception and design. But every discovery in India, Assyria, and Egypt, confirms their position as pioneers in the world's progress. Justice must be meted to all. The Semitic nations possessed brilliant imagination, gigantic and ready pow-

ers of invention; but they had not the faculty for adaptation and development which characterized the Indo-Europeans. The former invented, the latter perfected.

ARCHAISM, is the use of an antiquated expression. It may be either a word, declension, conjugation, or a form of speech. It is sometimes used with good effect in poetry, but it must be but seldom employed.

ARCHANGEL. I. The name of a government on the White and the Polar seas, the furthest north in European Russia. Lapps, Finns, and Samoyeds, many of them still heathen, form the native population, living independently among the conquering Russian settlers. The country is covered with immense forests, which afford excellent materials for ship building. The soil can only be cultivated in summer; it yields vegetables, oats, barley, and other hyperborean products. The area is more than 80,000 square miles; the population about 800,000. II. ARCHANGEL, or the city of the archangel Michael, named after a monastery built there in 1584, is the capital of the government. It is situated on the river Dwina, 40 miles from its mouth. It has about 15,000 inhabitants, a military and a civil governor, an archbishop, a high school or gymnasium, and a navy yard, and several private ship-yards. For nearly a century and a half Archangel was the principal and indeed the only mart of the Russian import and export trade, as, previous to the construction of St. Petersburg, the empire had no other considerable port. As early as the time of Queen Elizabeth, English merchant ships occasionally entered the mouth of the Dwina, and they were soon followed by those of the Dutch and the German Hansa. Thus, in the year 1670, bills of exchange, though unknown elsewhere in Russia, were introduced in Archangel. The harbor is large and one of the best in northern Europe, with the exception of a sandy bank at the entrance. Archangel is still one of the principal points for the trade with the interior of Russia and with Siberia, the Dwina being connected by canals with the Volga, and thus with Moscow and with Astrakhan. The ice disappears in April, and in May foreign vessels—now including many from the United States—arrive; the navigation closes in September. The principal objects of trade are fish, fish-oil, tallow, linseed, furs, hides, lumber, wax, iron, linen, bristles, and caviare. During the late eastern war the harbor of Archangel, defended by the fort Nowodwiesk, resisted the English attacks. Indeed the allies were rather unsuccessful on the shores of the White sea. Archangel, being able to receive the largest men-of-war, has now become one of the chief places for the construction and maintenance of the Russian navy, the Black sea being almost shut for that purpose by the treaty of Paris (1856). The buildings of the admiralty or navy-board, as well as the barracks for sailors, are situated on the island of Solombalsk; they have lately been considerably enlarged. In

summer Archangel sends out numerous fishing boats, and, in winter, hunters to the utmost northern regions, such as the Spitzbergen, Nova Zembla, and the mouth of the Lena in Siberia. A special company has been formed in Archangel for the herring fishery.

ARCHBISHOP (Lat. *archiepiscopus*), the chief of the bishops of an ecclesiastical province. The dignity originated by degrees in the progress of the hierarchy. As the bishops of the cities, especially of those churches which had been founded by the apostles, acquired authority over adjacent country congregations, so they themselves became dependent upon the bishops of their metropolis; and thus a few chief cities, which were the centres from which Christianity spread into the towns and countries, became also the centres of authority. The first formal sanction of this authority was by the council of Nice, A. D. 325, which distinguished the bishops of the capitals as metropolitans, and the more eminent of the metropolitans were termed archbishops or patriarchs. In the 8th century the title was applied to every metropolitan and to the more eminent of the bishops. Since that time, in Roman Catholic countries the archbishops have had a more definite position in the hierarchical scale, although their prerogatives have considerably varied. They possess a double character, exercising over their own diocese ordinary episcopal functions, and also having a jurisdiction over the bishops of their province, who are hence termed suffragans. They claim the right of calling provincial synods, of presiding at them, and publishing their acts; also the right of supervision, and an appeal lies to them from the decisions of the bishops. The archbishop also supplies benefices left vacant by the bishops for a longer time than that prescribed by the canons, and receives the bulls of the pope which he announces to his suffragans. He enjoys also other prerogatives, as the use of the *pallium*, a decorated robe symbolizing superior power, the privilege of having the archiepiscopal cross carried before him, except in the presence of the pope or his legate, and of pronouncing the benediction through the whole extent of his province. His civil rank is fixed by special law, and his ecclesiastical rank is next to that of cardinals.—The archiepiscopal dignity has been retained in several Protestant churches, particularly in the Anglican church. The ecclesiastical government of England is divided into 2 provinces, Canterbury and York. The archbishop of Canterbury is the chief primate and metropolitan of all England, first peer of the realm, and member of the privy council. It is his prerogative to crown the king, and he is consulted by the ministry in all ecclesiastical affairs, and generally delivers in parliament the sentiments of the bench of bishops. The archbishop of York crowns the queen, and is her chaplain. He also belongs to the privy council, but his inferiority to the archbishop of Canterbury is recognized in his

being styled simply primate of England, while the latter is styled primate of all England. The 2 archbishops have precedence of all temporal peers, excepting those of the blood royal, and excepting the lord chancellor, who in processions is interposed between them. The archbishop of St. Andrews was the metropolitan of Scotland while episcopacy prevailed in that country, and the archbishop of Armagh is primate of all Ireland. In Denmark the bishop of Copenhagen has precedence of the others, but the bishop of Zealand is the metropolitan, and anoints the king. In Sweden the bishop of Upsal is the archbishop. In France there are now 15 Catholic archbishoprics; in Italy, 88; in Spain, 8; and in the United States of America, 7. In Germany, 8 of the archbishops, those of Treves, Cologne, and Mentz, were electors of the empire. Archbishops in the Catholic church are nominated by the archiepiscopal chapters, and confirmed by the pope. In the church of England they are appointed by the ministry in the name of the crown.

ARCHDALE, JOHN, governor of Carolina, lived in the latter half of the 17th century and the beginning of the 18th. He was a quaker and one of the proprietors of Carolina, by whom he was deputed to act as governor of the province, after Lord Ashley had declined the office. He arrived in the country in 1695, was received with every demonstration of joy, and in the course of a year, by wise and judicious measures, succeeded in restoring order and contentment in the place of confusion, and in developing very considerably the resources of the country. To him is due the introduction of rice, now one of the most important staples of the Carolinas. He remained in the province but a year, and in 1707 published a descriptive and historical work on it.

ARCHDEACON, an ecclesiastical dignitary, the assistant of the bishop. At the beginning of the 4th century there was in almost every diocese an archdeacon, invested with authority by the bishop, particularly in the administration of temporal affairs. To him belonged the care of preserving public order and propriety during the divine service, of guarding the ornaments of the church, and of tending the poor throughout the diocese. He was called the hand and the eye of the bishop, and, from his influential position, became recognized as superior to the priesthood, though retaining only the deacon's consecration. As overseer of the deacons and of the younger clergy who were not yet consecrated, he had the supervision of their education and studies, so that a certificate from him was required before their ordination to the priesthood. When the dioceses began to enlarge, and the metropolitan churches to attach to themselves the neighboring country congregations, it became necessary to divide the diocese into a number of archdiaconates. The archdeacons increased in independence and power till the 18th century, when they claimed a jurisdiction proper to themselves, and the

right to appoint their own subordinates. Though their power was not developed in every quarter to an equal extent, it was yet always hazardous to that of the bishops, and a reaction against it arose. Several synods sought directly to limit their prerogatives, and it was finally decreed by the Council of Trent that henceforth the archdeacons should hold their right of supervision only by the bishops' permission. From that time they have gradually disappeared from many dioceses. England is divided into 67 archdiaconates, and it is imperative upon each archdeacon to visit his district at least once in 8 years. It belongs to him to see that the churches and chanels are in repair, that every thing is done conformably to the canons, and to hear from the churchwardens any representations of public scandal. The revenue attached to this office is very small, so that it is usually held by persons who have other benefices. The archdeacons are appointed by their respective bishops.

ARCHDEKIN, RICHARD, a Jesuit and theologian, born at Kilkenny, in Ireland, in 1618, died at Louvain in 1698. He became a Jesuit in 1642, and spent the greater part of his life in the Belgian provinces, preaching the theology and philosophy of the order in many places. He published a "Treatise on Miracles" and *Controversia Fidei ad facilem Methodum reducita*, a work which had a great reputation, and went through numerous editions.

ARCHDUKE. Early among the Germans the chiefs or kings appointed from their immediate companions dignitaries of various rank, and thus we find among the Franks archdukes of Austrasia; the title also existed in Lorraine and Brabant, and was especially assumed by the house of Austria, without, however, a positive historical record as to when or why it was granted to them by the emperors. The Kahleberg branch of the house of Austria or Hapsburg has used the title since the year 1156, but without special privileges. It became hereditary in that line after the promulgation of the golden bull, but the electors did not recognize its validity till the year 1458. It is supposed, however, that Maximilian I. extended this dignity to his branch of the family, attaching to it various privileges, and placing the archdukes in every respect above all other crowned vassals of the German empire. The Hapsburgs have preserved it ever since; and since the destruction of the feudal Roman-German empire in 1806, all the male and female members of the house of Austria have been called archdukes or archduchesses.

ARCHELAUS. I. Surnamed PHYSICUS, or the Naturalist, is by some supposed to have been a native of Athens, by others of Miletus. He flourished in the 5th century, and was a pupil of Anaxagoras. Archelaus is said to have been the first philosopher who taught physics in combination with ethics, at least in Greece, whence, probably, his synonyme. His way of accounting for the existence of this lower world

and its inhabitants, was somewhat singular. He held that the antagonism of heat and cold caused the separation of fire and water, and produced a slimy mass of earth; that while this mass was acquiring consistency, the action of heat upon its moisture generated animals, which were originally nourished by their native mud, and gradually became capable of propagating their species; that these animals were all endowed, though in different degrees, with intellect, and that man, separating in time from his brother animals, rose above the condition of a brute, and established, at length, laws and communities. His most remarkable ethical doctrine, and that which formed the basis of his moral system, was that "right and wrong are not from nature, but from custom." After the banishment of Anaxagoras from Athens, Archelaus established himself in that city as a teacher of this mixed philosophy, in which he is said to have instructed Socrates and Euripides. II. A king of Macedonia from 418 B. C. to 399 B. C. He was, according to Plato, an illegitimate son of Perdiccas II., and a monster of cruelty. Thucydides, however, appears to know nothing of his revolting vices, and evidently considers him one of the best of the Macedonian kings. If we may believe this great authority, Archelaus did more for the internal improvement and future grandeur of his kingdom than all his predecessors. By erecting fortresses, forming roads, and adding to his military strength, he established the basis on which, in after times, the genius of Philip and Alexander raised the superstructure of Macedonian power. He also instituted public games at *Arga*, or *Dium*, in imitation of those at Olympia, which he dedicated to the Muses, and Zeus. Even his enemies admit that he was a lover of literature, science, and the fine arts. His palace was adorned with paintings by the greatest Grecian masters, while Euripides, Agathon, and other distinguished men, as well poets as philosophers, did not disdain to become his guests, and to accept him as a patron. Archelaus is said to have been slain at a hunting party, by his favorite, Craterus, but whether he was killed accidentally, or murdered deliberately, is not certainly known. III. Son of Theodorus, was made governor of Susiana by Alexander the Great. On the distribution of the provinces, after the death of his sovereign, he received Mesopotamia as his portion. IV. A sculptor, was a native of Priene, and the son of Apollonius. He is supposed to have lived in the reign of Claudius. He made, probably, for that emperor the marble bas-relief representing the apotheosis of Homer. This celebrated work is now in the British museum, and is worthy of being ranked with the most exquisite productions of ancient Greece. V. The greatest of the generals of Mithridates, was by birth a Cappadocian. He first appears in history as commander of the army which his master had sent against Nicomedes, king of Bithynia, whom he encountered in Paphla-

gonia, and completely defeated. On the outbreak of the first Mithridatic war, he was dispatched with a powerful naval and military force into Greece, where he subdued many of the *Ægean* islands and compelled the Athenians to take part against the Romans. But when Sylla assumed the conduct of the war against Mithridates, the triumphant career of Archelaus terminated. At *Chæroneæ* and *Orchomenos*, in Boeotia, his Asiatic myriads were totally overthrown, and almost annihilated, and he was himself driven, after each defeat, to become a fugitive, and elude his enemies by concealment. Mithridates now saw the propriety of suing for peace, and commissioned Archelaus to negotiate with his conqueror. The two generals met at *Delium*. Before proceeding to business Sylla is said to have vainly endeavored to induce Archelaus to betray his sovereign. Afterward a preliminary treaty was concluded, which was to be ratified if approved by Mithridates. It was not approved by him, but Sylla passing over to Asia, by the advice of Archelaus had an interview with the king at *Dardanus*, and there made peace with him. This peace was chiefly brought about by the mediation of Archelaus, and was so favorable to the Romans, in the estimation of his master, that henceforward the general was regarded as a traitor, and had ultimately to take refuge with his former antagonists from the vengeance of Mithridates. He was well received by the Romans, and had many favors conferred on him by the senate, but from the period of his flight he disappears from public life, and nothing more of interest is known concerning him. VI. Son of Archelaus, the general of Mithridates, was made priest of the goddess *Bellona* at *Comana*, in Cappadocia, by Pompey in 68 B. C. This office conferred on him the power of king over *Comana* and its territory. But Archelaus was ambitious of greater honor than attached to the high-priesthood of *Comana*, and when *Berenice*, queen of Egypt, proclaimed that she was desirous of marrying a prince of royal blood, he pretended to be the son of Mithridates Eupator, and became a suitor for her hand. His suit was successful, and Archelaus presently found himself the husband of *Berenice*, and king of Egypt. But he did not long enjoy his new dignity. *Gabinus*, the proconsul of Syria, having espoused the cause of *Ptolemy*, marched an army into Egypt, where a battle was fought in which Archelaus lost his crown and life after a reign of only 6 months. VII. A Greek epigrammatic poet who flourished in the reign of *Ptolemy Philadelphus*, and is supposed to have been a native of *Chersonesus* in Egypt. He is said to have epigrammatized stories for the amusement of *Ptolemy*, and to have written poems of a similar kind on strange animals and paradoxical subjects. The best edition of the extant fragments of the works of Archelaus, is that of *Westermann*. VIII. Son of Archelaus the priest, succeeded to the office of his father at *Comana*. In 51 B. C. having aided the in-

surgents in Cappadocia with money and men, he was expelled from his dominions by Cicero, who was then proconsul of Cilicia. After the termination of the Alexandrian war, he was deprived of the high-priesthood of Comana by J. Cæsar, who gave it to one of his own adherents. IX. Son of the preceding, was made king of Cappadocia by Anthony, in 84 B. C. He is said to have owed his crown to the beauty of his mother, Glaphyra. The downfall of his patron caused no unfavorable change in the fortunes of Archelaus. Augustus confirmed him in the possession of his kingdom, and even added to it a portion of Cilicia and Lesser Armenia. Archelaus, during this emperor's reign, was once accused at Rome by his own subjects, but he had Tiberius himself for an advocate on the occasion, and was of course acquitted. But the imprudence of Archelaus while sojourning in Rome transformed Tiberius into a bitter enemy. He had been so impolitic as to manifest more esteem and respect for Caius Cæsar than Tiberius, and when the latter became emperor he did not forget the slight of Archelaus. He invited the king to visit once more the imperial city, and, as soon as he came, had him arrested and accused before the senate of meditating treason and rebellion. His old age saved his life, but he was compelled to spend the remainder of his days in Rome, where he died soon after. On his death Cappadocia ceased to be a kingdom and was converted into a Roman province. X. A son of Herod the Great, was proclaimed king by the army on the death of his father. But he declined to assume that dignity without the sanction of Augustus. After his accession he made many fair promises to the people, which, however, he never fulfilled. Presently a sedition broke out, in the suppression of which he manifested the cruelty of his nature. He then went to Rome to solicit from the emperor the confirmation of his title. In this object he did not succeed. The title of king was denied him, and half the kingdom given to his brother. He was, however, left the sovereignty of Judea, Samaria, and Idumæa, with the title of ethnarch. On his return from Rome he evinced his contempt for the Mosaic law by taking to wife Glaphyra, his brother Alexander's widow, who had children living by her former husband. In the 10th year of his reign he was accused by the Jews, before Augustus, of various crimes, and being found guilty was deprived of his dominions, and banished to Gaul, where he died.

ARCHENHOLZ, JOHANN WILHELM VON, a German author, born at Langenfurt, a suburb of Dantzic, in 1741, died at Hamburg in 1812. In 1760 he entered the Prussian army and took part in the 7 years' war. In 1768 he left the service and betook himself for the next 16 years to travelling over Europe. On his return to Germany he devoted himself to literary pursuits, and lived successively at Dresden, Leipzig, Berlin, but chiefly at Hamburg. His work on "England and Italy" gave him some repu-

tation; his histories of "Queen Elizabeth" and "Gustavus Vasa" enjoyed also much popularity, but his most valuable work is that which he wrote on the "Seven Years' War." His "Annals of British History since 1788" are piquant and full of anecdote. In his "Historical Essays" he gives in the second volume an interesting account of the filibusters and pirates who infested the West Indies during the 18th century. From 1782 to 1791 he edited a periodical called *Literatur und Völkerkunde*, and from 1792 to the time of his death he was editor in chief of the *Minerva*. He was not a man of great learning or erudition, but of vivid imagination and quick perception.

ARCHERY, the art of shooting with the bow. This is, probably, the oldest and most general of all the means and appliances of war and the chase. The first direct mention which we find of the bow, is the passage in Genesis xxvii., where Isaac said to Esau, "Now, therefore, I pray thee take thy weapons, thy quiver and thy bow, and go out into the field and take me some venison;" but there can be no doubt, from other reasons, that it was already a well-known instrument, probably before the deluge, but at least as early as when Nimrod "began to be a mighty one on the earth;" and that it was one of the principal weapons of destruction at the battle of the kings in the vale of Siddim, as it has continued to be with all oriental nations to the present day.—Next earliest to, or rather contemporaneous with, the historical books of holy writ, come the marvellously preserved testimonies borne to their truth by the sculptures of Nineveh, in which the bow is represented as the favorite weapon of the king and his chief warriors, whether for war or for the chase. In these sculptures it is a long and powerful instrument, drawn to the ear of the shooter, like the famous English longbow, and carrying an arrow not apparently inferior in size to the cloth-yard shaft of the famous island archers.—In Greek, as in Roman warfare, the use of the bow never played a prominent part; among the former nation, archery being confined, for the most part, to the islanders, particularly those of Crete, and scarcely considered a fitting pursuit for fragmen, who always served in the heavy-armed infantry, which formed the line of battle, and constituted the effective force of the Hellenic armies. In the Iliad, Teucer, the son of Telamon, king of Salamis, and Pandarus the Lycian, are the only two warriors particularly recorded as celebrated for their skill with the bow; and even these play but a secondary part, lurking behind the shields of the stouter chiefs and shooting from ambush, instead of boldly contending, man to man, in the front ranks. In the case of the latter, however, Homer describes both the bow and the manner of using it; from which it sufficiently appears how very inferior an instrument it was to the oriental, much more to the Anglo-Norman longbow. The weapon of Pandarus was made of the horns of a wild goat, polished, and fast-

ned together in the centre by a golden band or circlet; when bent, it was drawn back against the regular curvature or natural growth of the horn, and the string and feather of the arrow was only drawn home to the breast, instead of the right ear, allowing of course the use only of a comparatively short arrow, and giving but a very inferior extension to the bow.—The Greek bow, in fact, was an inconsiderable weapon, and so well were they aware of the fact, that even where they were opposed to troops famous for their proficiency with the bow, they rarely endeavored to confront their archery with archery, but sought other means to silence their shot.—At the battle of Plataea, where the Greek allies, who had no cavalry at all and scarcely any light troops worthy of mention, suffered prodigiously during the first two days' fighting from the arrows of the Persians, the Athenians were the only people who had archers in the field, and they were probably not Greeks, but the public slaves—*Demotii*—mostly Scythians or Thracians by birth, who formed the city guard, dwelt in tents on the Areopagus, and were officered by captains with the title of *toxarcha*, masters of the bows. These men, being mingled with the files of the *hoplites*, or heavy foot, under Olympiodorus, did good service, and outshot the famous Persian bowmen.—Again, in the celebrated retreat of the ten thousand, Xenophon soon found that his Cretans could not shoot half so far as the Persians, and came yet shorter of the terrible Carduchian mountaineers of Koordistan, who fought with 6-foot bows and arrows of 2 cubits' length, and drew their bow-strings to the ear; wherefore he disbanded his bowmen, and organized a force of Rhodian slingers, who slung leaden bullets instead of stones, so as to overpower even the arrow shot of the Carduchians.—Among the Romans, archery was even less practised than among the Greeks; and, until a late period of their history, they never appear to have used the bow as an arm of service, the light javelin being the weapon of their skirmishers. But skirmishing was not a part of the Roman tactics, when they could avoid it, their chief aim and desire being to come as quickly as possible to close quarters, and to resolve the battle into a series of single combats, with the buckler and stabbing broadsword; when the personal prowess and thorough drilling of their men speedily settled the question.—In the latter days of the republic, however, Cretan and even Scythian archers, Rhodian and Balearic slingers, and the Gallic horse—for the Romans were as deficient in cavalry as they were in bowmen and skirmishers—served in their ranks; and during the later days of the empire, Goths, and even Huns, mercenaries or auxiliaries, were largely employed in the heterogeneous masses, which were still called Roman armies, although Romans there were few or none in their composition.—The oriental nations, however, still preserved to the end their superiority in this arm. Crassus fell; Mark Antony, that consummate

soldier, barely escaped with his army after an unparalleled retreat; and Julian, the greatest general of the later empire, lost his life, leaving his empire to be barely saved from utter ruin by his successor, Jovian, in the unequal contest between the incomparable infantry of the legions, and the myriads of horse-archers, indestructible as swarms of locusts, which formed the strength of the hosts of the Asiatic tyrannies.—The great period of archery, however, arrived with the accession of the Norman line to the English crown, and from that time dates the supremacy of the longbow as a military weapon for infantry, and the perfection of skill in its use, both for range and penetration, not to dwell on its extraordinary accuracy, which enabled it, long after the introduction of musketry, to retain its place as the chief of infantry arms.—Originally a weapon of the Norse tribes, it was brought by Duke Rollo and his followers into southern Europe, and skill in its use was considered as essential a part of the education of a Norman knight, as it was of a Persian prince, when to ride, to shoot, and to speak the truth, were esteemed the first things to be inculcated by the preceptors of youthful royalty. It is related by William of Malmesbury, that not a man in the Conqueror's army "could draw his bow, which himself could bend when his horse was on full gallop;" and the Norman archers, whom the Saxons took at first to be priests on account of their being so closely shaven, did good service at Hastings, where the Saxons, being all infantry, and fighting with crossbows and *gisarmes*, or heavy bills and battle-axes, were intrenched within palisaded lines, which the Norman chivalry were unable to force. The palisades at first prevented the effect of the Norman arrows, when shot in point-blank volleys; but when they began to send their flight-shots perpendicularly into the air, so that they should strike on their descent, they galled the defenders so severely, that, partly owing to their distress on this account, partly owing to a feigned retreat by the cavalry, the Saxons broke out of their defences to come to hand and hand encounter, when they were ridden down by the barbed horses.—It was not, however, until the gradual amalgamation of the two peoples into one nation was somewhat advanced, and until the Saxons had adopted the Norman longbow, so that it became the national English weapon, and that "bills and bows" the weapons of the two tribes which had fought in opposition at Hastings became the call to arms of the English infantry, that the bow achieved its full renown.—This began to be the case at a very early period, since the Saxons, who fled to the forests and morasses, which at that time covered one-half the islands, for shelter from the intolerable oppression of their Norman masters, immediately adopted this weapon, and acquired such fearful dexterity with it, that the weapon they had themselves introduced became the sharpest thorn in the side of the invaders, and continued

to work them sore damage, until Normans and Saxons were at length happily merged into one homogeneous English nation. Thenceforth it became the terror of the enemies of England. Not a country of the European continent, not even the Saracens during the crusades, but learned the superiority of the island archers, and soon came to avoid them as the most formidable of all enemies. In Spain, France, the Netherlands, even among the Alpine fastnesses of Switzerland, the English longbow was known, and the twang of its fatal cord universally dreaded. In all the extraordinary pitched battles of the English Plantagenets on the soil of France, won, contrary to all expectations, and against odds the most imposing, it was the English infantry and the English longbow which did the work. And the mere circulation of a report that any one of the fair-haired Henrys or Edwards was at sea with 8,000 or 10,000 archers, was enough to set the alarm-bells ringing from Calais to Notre Dame, and to call the feudal militia at once into the field. Philip de Comines acknowledges that the English archers excelled those of every other nation; Sir John Fortescue declares that "the safety of the realm of England standeth on its archers;" and there is scarce an English reign, from that of Edward I. to that of Elizabeth, and her successor, James I., in whose time the use of the bow began to decline, in which orders to the sheriffs of the counties did not issue—many of which have been preserved—for the providing of bows and bundles of arrows, and practising the yeomanry of the shires in archery, as a precautionary measure against the casual breaking out of war. So late as to nearly the end of the 16th century, the longbow was the principal arm of the infantry soldier of England. The longbow was made by preference of Spanish yew; but English yew, and, when that could not be obtained, ash, was used in its place. The proper length of the bow was the height of the archer, and the arrow half the length of the bow; the strength of the weapon was also proportioned to the muscular strength of the archer. From 60 to 90 lbs. was the force requisite to draw a cloth-yard arrow to the head on a 6-foot bow.—Arrows were made of sound ash for military use, of oak, horn-beam, or birch, for pastime; but a yew arrow, that would weigh from 20 to 24 pennyweights, was counted the best, and was feathered with two white feathers of a gander and one gray one from a goose, the latter being the longest, and held uppermost on the bowstring. English arrows had at first forked, and then broad heads for warfare; but the round-pointed or bodkin-head was considered best for accurate shooting. The arrows were reckoned by sheaves, each sheaf containing 24 arrows, which were carried in covered quivers. In old times, arrows were often feathered, as described by Chaucer, from the peacock's tail. They were ordained by a proclamation of Henry IV. to be well boiled or braised, and the points to be hardened

with steel. The bowstrings were of plaited silk.⁴ The power of flight, correctness of aim, and penetration of these terrible missiles, were prodigious. In shooting matches, 800 yards was the common range, and the ordinary mark was a straight willow or hazel rod, as thick as a man's thumb, and 5 feet in length; and such a mark as this a really good archer held it shame to miss.—When shooting together, as it was called, or, as we should say, in volleys, they occasionally discharged their arrows at a much longer range, particularly when shooting from upper ground, or at an elevation, and with fatal effect.—At 200 yards, no armor but the best Spanish or Milan steel-plate could resist the English arrow; and the legends of men and horses shot through and through, are proved by corslets of the stoutest plate, preserved in the collections of the earl of Pembroke, at Wilton, Dr. Meyrick, and others, where the shafts have been driven through the breastplate and the whole body of the wearer, and then through the steel backplate, not inferior in strength to the breast.—The following graphic description of the battle of Crécy, from the old translation of Froissart, by Lord Berners, so admirably illustrates the effect of the shot of a longbow, that no excuse is needed for quoting it entire: "When the Genoese were assembled together, and began to approach, they made a great leap and cry to abash the Englishmen, but they stood still, and stirred not for all that. Then the Genoese again the second time made another leap and a fell cry, and stepped forward a little, and the Englishmen removed not one foot. Thirdly, again, they leaped and cried, and went forth till they came within shot, then they shot fiercely with their crossbows. Then the English archers stepped forth one pace, and let fly their arrows so hotly and so thick, that it seemed snow. When the Genoese felt the arrows piercing through heads, arms, and breasts, many of them cast down their crossbows, and did cut the strings, and returned discomfited. When the French king saw them fly away, he said, 'Slay these rascals, for they shall let and trouble us without reason.' Then you should have seen the men-at-arms dash in among them, and killed a great number of them; and ever still the Englishmen shot where as they saw the thickest press; the sharp arrows ran into the men-at-arms, and into their horses, and many fell, horse and men, among the Genoese; and when they were down, they could not relieve again. The press was so thick that they overthrew one another. And also among the Englishmen there were certain rascals that went afoot with great knives, and they went in among the men-at-arms, and slew and murdered them as they lay on the ground, both earls, barons, knights, and squires, whereof the king of England was after displeased, for he had rather they had been taken prisoners."—This account of one battle is, in fact, the account of all which were fought victoriously by the English against the French and

the Scots, during the middle ages. Crécy, Poitiers, Agincourt, and 50 other actions, of less note on the soil of France; Halidon Hill, Solway Moss, Northallerton, and Neville's Cross, in Scotland, or on the frontiers, were all fought and won in the same manner, and on the same principle, by the archery or independent yeomanry of England, the bills and axes of the footmen and the charge of the horse being brought into play, secondarily only, in order to complete the defeat already inflicted by the bowmen. The few instances in which an English army of the middle ages, strong in its archery, was defeated, such as Bannockburn, almost a solitary case in point, occurred where the archery, having neglected to fortify their front with a palisade or *cheval-de-frise* of iron-shod stakes, were charged by horse which they were unable to resist for want of long weapons and of defensive armor; for the brigantines or light scale jackets of the bowmen could no more resist a lance-thrust or the sweep of a two-handed sword than could a silken vest. Long after the introduction and complete success of musketry, which may be said to date from the battle of Pavia, after which chivalry and the feudal power of an aristocratic cavalry were at an end, archery still continued to be cherished in England, and regarded as the mainstay of the national defence (just as the rifle was considered but a few years since in the United States), as is shown by a curious proclamation, in manuscript, of the times of Elizabeth, which gives, perhaps, the best account now in existence of an archer, with all his necessary appendages. "Captains and officers," it runs, "should be skilful of that most noble weapon, and see that their soldiers, according to their draft and strength, have good bows, well stringed, and every string whipped in their notch, and in the middles rubbed with wax; bracer and shooting glove; some spare strings trimmed as aforesaid; every man one sheaf of arrows with a case of leather defensible against the rain; and in the same 4 and 20 arrows; whereof 8 of them should be lighter than the residue, to gall or astonish the enemy with the hail-shot of light arrows, before they shall come within the danger of the harquebuss-shot. Let every man have a brigandine, or little coat of plate, a skull or hussyn, a maul of lead 5 feet in length, and a fusée, and the same hanging by his girdle with a hook and a dagger. Being thus furnished, teach them by musters to march, shoot, and retire, keeping their faces upon the enemy's. Sometimes put them into great numbers as to battle appertaineth, and thus use them oftentimes practised until they be perfect. For those men in battle or skirmish, cannot be spared. No other weapon can compare with the same noble weapon." Nor does this praise seem extravagant or unwarranted by the truth, when we look at its success in the hands of those to whom that proclamation was addressed. Yet it is something singular, how purely national a weapon the bow was, at this period of its greatest effectiveness, no other

nation ever having shown themselves able to acquire such mastery of the weapon as should give them any chance of coping on even terms with the English; although the kings, both of France and Scotland, used every imaginable incentive to promote the use of the bow and the cultivation of archery practice in their respective kingdoms. Roger Ascham published, philosopher and grave scholar that he was, a code of instructions to the archer, which are still applicable and excellent for those who practise this ancient art, as a graceful accomplishment and exercise; and first of all he recommends a graceful attitude. "The archer should stand," he says, "fairly and upright with his body, his left foot at a convenient distance before the right; holding the bow by the middle, with his left arm stretched out, and with the first 3 fingers and the thumb of the right hand upon the lower part of the arrow affixed to the string of the bow. In the second place, a proper attention is to be paid to the notching, that is, the application of the notch at the bottom of the arrow to the bowstring." We are told that the notch of the arrow should rest between the forefinger and middle finger of the right hand. Thirdly, our attention is drawn to the proper manner of drawing the bowstring. "In ancient times," says Ascham, "the right hand was brought to the right pap, but at present it is elevated to the right ear. The shaft of the arrow, below the feathers, ought to be rested on the knuckle of the forefinger of the left hand." The arrow was to be drawn to the head, and not held too long in that situation, but neatly and smartly discharged, without hanging upon the string. Among the requisites necessary to constitute a good archer, are a clear sight steadily directed to the mark, and proper judgment to determine the distance of the ground; he ought also to know how to take the advantage of a side-wind, and to be well acquainted with what compass his arrows would require in their flight. Courage is also an indispensable requisite, for whoever, says our author, shoots with the least trepidation, is sure to shoot badly. One great fault he complains of, which young archers generally fall into, and that is, the direction of the eye to the end of the arrow, rather than to the mark; to obviate this evil habit, he advises such as were accustomed, to shoot in the dark, by night, at lights set up for that purpose. He then concludes with observing that bad tutorage was rarely amended in grown up persons; and therefore he held it essentially necessary that great attention should be paid to the teaching of an archer properly, while he was young; "for children," says he, "if sufficient pains be taken with them at the outset, may much more easily be taught to shoot well than men," because the latter have frequently more trouble to unlearn their bad habits than would have been primitively necessary to teach them good ones. For all military purposes, and indeed, for all practical purposes whatever, the bow has long ceased to be of use

to any civilized nation, although archery is still kept up as a popular accomplishment and sportive exercise, in which even ladies often join and meet with great success, in the British islands. The last time bows were seen as weapons of civilized war, was when the allied troops were in Paris after the abdication of Napoleon at Fontainebleau, when many of the most remote auxiliaries and tributaries of the Russian empire, the Bashkirs, the Usbecks, and some of the subjugated Circassian tribes, rode through the streets and boulevards of the French metropolis, sheathed in suits of chain mail, with bowcases beside their scimitars on their thighs, and quivers on their shoulders. As instruments of war and the chase, the bow is now confined to the most savage and uncivilized tribes, and but one people has ever been discovered so barbarously ignorant as not to have attained sufficient inventive genius to devise, or skill to use, the bow and arrow; those are the natives of Australia, undoubtedly the lowest created beings that wear the form of humanity, and claim the name of man. The disuse of the bow by the Esquimaux is not the consequence of ignorance, but of the want of materials, no wood being attainable by them from which a bow could be constructed. Many of the North American Indians, in past times, were exceedingly expert with the bow; but they early adopted the musket or the rifle, and, at the present day, except among the most remote frontier tribes, the bow is never seen unless it be among the children, or as an implement for catching fish. The Camanches, however, are an exception, for to this day, like the Parthians of old, their force consists in the perfection of their unrivalled horsemanship and of their unerring archery. Their bows are short, and their arrows clumsily pointed, but they are feathered on the true principle, exactly as was the old English cloth-yard arrow; and the warriors discharge them with such tremendous force that they have been known to pass entirely through the body of a bison, and fall, crimsoned with blood, on the further side. Such weapons are not harmless even against the arms and discipline of the whites, and many a gallant American has fallen by the unerring shafts of these fierce and indomitable savages, the last men, probably, on earth who will be famous as an archer nation.

ARCHES, COURT or, a court of ecclesiastical law in England. Properly the arches court has a very limited jurisdiction over part of the city of London, but as the dean of arches is usually the deputy of the archbishop of Canterbury, nominally the supreme ecclesiastical judge of England, the arches court has come to be the chief court of appeal in the province of Canterbury, which includes nearly the whole of England. An appeal lies from the court of arches to the king in council, *i. e.*, to the judicial committee of the privy council. The dean of arches is *ex officio* president of the college of advocates of civil law, and as the admiralty law is founded on the civil law and *jus*

gentium, it is usual to constitute the dean of arches the principal judge in admiralty.

ARCHIAC, ETIENNE JULES ADOLPHE DESMIRE DE ST. SIMON, vicomte d', author and geologist, born at Rheims, Sept. 24, 1802. He graduated from the military school of St. Cyr, as an officer of cavalry, in 1821, but quitted the service after the revolution of 1830. He had previously shown a taste for literature, and had published a romance entitled "Zizim; or, the Chivalry of Rhodes," but he henceforth devoted himself exclusively to scientific pursuits, and particularly to geology. His contributions to this department of knowledge have been many and valuable. The most important work that he has undertaken is the "History of the Progress of Geology from 1834 to 1851," which is published under the auspices of the French government. It is to consist of 8 volumes, of which 4 only have been completed.

ARCHIAS, A. LIONIUS, a Greek poet, born at Antioch toward the close of the 2d century B. C., and of whom we should know almost nothing were it not for the extant oration of Cicero in his defence. When a young man he went to Rome, and was treated with much attention by the leading men of the republic. He became particularly intimate with the Licinian family whose name he assumed as a token of respect. He attended Lucullus to Sicily, and afterward to Heraclea in Lucania, whither his patron was banished for his conduct in the Servile war. He was with Lucullus in Asia during the 1st and 8d Mithridatic wars, and in the interim he accompanied him into Africa. He at length returned to Rome, but no sooner did he do so than an accusation was brought against him for having assumed, without just title, the privileges of a Roman citizen. The case was tried before Q. Cicero, who was then prætor, and his relative, Marcus Tullius, undertook the defence. The result is unknown. Cicero and Quintilian assert that the poems of Archias were equally remarkable for beauty of style and variety of thought.

ARCHIATOR (Gr. *αρχιατρος*, chief physician), a title which seems in the first place to have been purely honorary and not official. In the times of the Roman emperors, the state of medical science was very low among the Romans. Greek physicians were therefore encouraged by the emperors to come to Rome. To remove as much as possible the prejudice naturally excited against them by national pride, Julius Cæsar bestowed on them the rights of citizenship. Augustus was taken with violent arthritic pains, and was successfully treated by Antonius Musa with cold affusions. In gratitude for his recovery, Augustus knighted his medical attendant, and exempted all the physicians of the empire from taxes and public burdens. Nero first gave the title archiator to his physician, Andromachus the elder. What was intended only as a personal compliment to Andromachus, coming from so august a source, passed rapidly into an institution, and archiator

became the designation of a class, a rank with degrees. The archiatri were divided into two classes, the city archiatri and the court archiatri, whose spheres of action and privilege are sufficiently indicated by the terms themselves. Later it came to be a civil requirement (Ant. Pius) that small cities should have 5 archiatri, larger ones 7, and the largest 10. The archiatri were salaried officers, and were expected to treat the poor gratuitously. As perquisites, they charged the rich for practice, and also had certain stipends called *annonaria commoda*. It was also considered a part of their duty to teach medical science to as many pupils as chose to avail themselves of their instructions, and to exercise a general supervision over the health of their medical dioceses, and the practice of the inferior physicians. We see here the germ of medical colleges and boards of health. In Sweden and Denmark the order still exists. In Sweden, however, only the court class of the archiatri is recognized. The archiatri were usually elected by the suffrages of physicians.

ARCHIDAMUS, the name of several kings of Sparta. I. The son of Anaxidamus, who lived during the Tegeatan war, which broke out soon after the termination of the second Messenian war, in the year 668 B. C. II. The son of Zeuxidamus, and succeeded to the throne in the year 469 B. C. In the 5th year of his reign there was an earthquake in Laconia which almost destroyed Sparta. In that trying period the foresight of Archidamus probably saved the surviving citizens from being massacred by the Helots. Apprehending danger from their scattered and defenceless condition, he caused an alarm to be sounded, which speedily collected such a body of them round him as was sufficient to deter their enemies from attacking them. In the wars against the revolted Messenians it was Archidamus who commanded the armies of Sparta. In the discussions at Sparta and Corinth, which preceded the rupture with Athens, he acted a prominent part, and always as the advocate of peace and moderation. He survived the outbreak of the Peloponnesian war about 5 years, during which time he had the conduct of three expeditions against Attica and one against Platæa. Archidamus died in the 42d year of his reign, 427 B. C. He was a wise and excellent man, the friend at once of his country and of Greece. Archidamus left two sons, named Agis and Agesilaus, and one daughter, named Cynisea, who is said to have been the only woman that ever won a victory in the hippodrome at Olympia. III. Son of Agesilaus II. While yet a boy he prevailed on his father to pardon Sphodrias, who had dared to make an irruption into Attica at a time of profound peace. In 371 B. C. he was sent to the relief of his countrymen who had been vanquished at Leuctra. In 367 B. C. he defeated the Arcadians and Argives in what the Spartans termed the "scarless battle," because they had won it without the loss of a

single man. In 362 B. C. he was intrusted with the defence of Sparta while Agesilaus was absent at Mantinea, and repelled the attack of Epaminondas on the city. In 361 B. C., on the death of his father, he succeeded to the throne. In 356 B. C. he supplied the Phocians with money to enable them to set at defiance the Amphyctionic decree, and to seize the temple at Delphi. Toward the close of the sacred war he entered Phocis with a considerable force to aid its people against the Macedonians and their allies, but on the approach of Philip Archidamus retired and left the Phocians to their fate. In 338 B. C. he went to Italy to succor the Tarentines, and was slain there in battle on the very day in which the Athenians and Thebans were overthrown at Chæronea. Archidamus III. appears to have been a warlike prince, but he was neither a great general nor a great statesman, and makes only a poor figure in either capacity after such kings as his father and grandfather. IV. Son of Eudamidas I. and grandson of Archidamus III., was king of Sparta in 296 B. C. In that year he was vanquished in battle by Demetrius Poliorcetes. V. Son of Eudamidas II. After the assassination of his brother, Agis IV., he fled from Sparta, but subsequently returned and possessed himself of the throne. He had hardly ascended it, however, when he was slain by the murderers of his brother, who feared his vengeance if his power should become confirmed. Archidamus V. was the last king of the Eurypontid race that reigned in Sparta. When he was killed the rights of his children were disregarded and his crown was given to a stranger.

ARCHIGENES, a Greek physician, whom Juvenal has immortalized. He was a native of Syria, and a pupil of Agathinus, whose life he is said to have once saved. He practised at Rome in the reign of Trajan.

ARCHIL, a deep reddish purple dye, prepared from the *lichen rocellus*, which grows on the rocks near the sea in the Canary and other islands in the Atlantic and Mediterranean, and a second variety of it from the *parellus* of the basaltic rocks of Auvergne in central France. It is a thick, liquid preparation of ammoniacal odor, and is obtained by macerating the lichens in a covered wooden vessel with some ammoniacal liquor. It affords many fine shades of red, but they lack permanence. It is particularly useful for modifying, heightening, and giving lustre to the other colors. The solution in alcohol is the colored liquid employed in spirit of wine thermometers.

ARCHILOCHUS, a Greek poet, classed by Cicero with Homer and Sophocles, born in the island of Paros, flourished between 720 and 660 B. C. While a resident of Thasos, he incurred disgrace by throwing away his shield in a battle. He was the inventor of iambics. His terrible invective is said to have caused several suicides. A hymn to Hercules was the most esteemed of his poems, and used to be sung three times in honor of the victors at the

Olympic games. The gross immorality of his works has caused most of them to be forgotten, in spite of their poetic merits.

ARCHIMAGUS, the chief of the Persian Magi, or fire-worshippers. From the time of Darius I. the office appertained to the Persian throne. A conspiracy had been raised among the Magi, to restore the Median power in the Medo-Persian empire, by representing one of their number to be Smerdis, whom Darius had previously slain in order to come to the throne. Darius caused the pretended Smerdis also to be put to death, and after a general slaughter of the Magi, ordered it to be engraven on his monument, after his death, that he was master of the Magi. He probably meant by the inscription only to commemorate his triumph over the Median conspiracy, but from that time the Medo-Persian king was designated *Archimagus*.

ARCHIMANDRITE, a superior, or general abbot in the Greek church, having under his superintendence several abbeys and monasteries. It is derived from the word *mandra*, signifying a monastery. In the old Greek church the archimandrite is subordinate to the bishop of the diocese, having, however, some episcopal functions in the ceremonial of worship. Thus, officiating at the mass, the archimandrite gives the blessing of fire—symbolizing faith and spirit, with a candelabrum in each hand, one with 3, the other with 2 branches—a privilege reserved to the higher members of the hierarchy. In Sicily, even at the present day, some abbots of monasteries of the order of St. Basil, founded by the Greek church, are called archimandrites. Abbots of monasteries of the United Greeks, that is, of that branch of the eastern church which recognizes the supremacy of the pope, are also called archimandrites. This branch of the church exists in Poland, Galicia, Hungary, Transylvania, and the Slavic countries around the Adriatic gulf, and in Venice.

ARCHIMEDEAN SCREW, an apparatus for raising water to a very limited height. It is formed of a centre-shaft, on which metal plates are fixed, like the thread of a screw; the whole is placed in an inclined cylindrical trough, the lower end of which is in the water to be raised, the other end overtopping a partition on the other side of which it is to be discharged. The screw fitting in the trough, is made to turn in the proper direction, and the water is screwed up, as a solid ball would be. Such machines are of necessity imperfect, and are to be used solely where power costs nothing, or unskilled labor has to be depended upon.

ARCHIMEDES, the most celebrated among the mathematicians and mechanicians of antiquity, born at Syracuse, Sicily, about 287 B. C. He is said, in early life, to have visited Egypt, and to have conferred upon that country several useful hydraulic machines. Several of the ancient historians speak of his wide-spread fame as an astronomer and a mechanician. Vitruvius tells us that King Hiero, suspecting that a

golden crown had been fraudulently alloyed with silver, asked his friend Archimedes to discover if it were so. Going one day into the bath-tub, it chanced to be full of water, and he instantly saw that as much water must run over the edge of the tub, as was equal to the bulk of his body. Perceiving that this gave him a mode of accurately determining the bulk and specific gravity of the crown, he leaped out of the bath and ran home, crying, "*Eureka, Eureka*, I have found it, I have found it;" and thus indissolubly associated his exclamation with the joy of discovering truth. In his old age he defended his native Syracuse against the Romans under Marcellus, with great mechanical skill, and later historians say that he burned the Roman ships by concentrating upon them the sun's rays from numerous mirrors. The accounts of his defence of Syracuse wear a fabulous air, and yet there is not one of his feats which is not within the limits of possibility. But his purely mathematical works, still extant, demonstrate him to have far excelled all those who had preceded him, and some of his papers are worthy of his successor, Apollonius. The most celebrated are those on the ratio of the sphere and cylinder, on the ratio of the circumference to a diameter, on spiral lines, and on the parabola. He requested a cylinder and sphere to be placed upon his tomb-stone, and when Marcellus had stormed Syracuse, and Archimedes had been killed by a Roman soldier, the Roman general conferred upon him an honorable burial, and caused the tomb-stone to be inscribed as he had desired. Cicero, 140 years afterward, being appointed quaestor over Sicily, sought and found the tomb of Archimedes, overgrown with weeds and thorns. Syracuse was taken 212 B. C.

ARCHINUS, an Athenian statesman and patriot, who aided Thrasybulus and Anytus in expelling the 30 tyrants from Athens, 403 B. C. It was he who recommended that the Cadmean or Ionic alphabet should be introduced in all public documents. From an ambiguous allusion in Plato, some writers have been erroneously led to attribute a funeral oration to Archinus.

ARCHIPELAGO, originally a specific name applied to the *Ægean* sea, but now a generic term, designating any body of water containing a great number of islands. 1. The original archipelago (the *Ægean*) is an arm of the Mediterranean sea, extending northward from the main coast line about 450 miles, with an average breadth of 200 miles. Its geographical position is between lat. 36° and 41° N. and long. 29° and 28° E. Turkey in Europe borders upon its northern and north-western coasts, Asia Minor upon its eastern, and the peninsula of Morea upon its western, while its southern limit is marked by an east and west tangent, to the southern shores of Candia, or Crete. Within these limits the *Ægean* forms an extremely irregular outline, having numerous armlets and indentations, among which may be mentioned

the gulfs of Argolis, Ægina, Volo, and Salonica, and Capes Malea, Colonna, Drepano, Santo, and Helles. It is studded with a vast number of islands, ranging in size from mere rocky islets to areas of 4,500 square miles (Candia), and mostly composed of calcareous masses, forming high bluffs, or mountain clusters, rising so abruptly from the sea that an average distance of one mile from their shores gives a sounding of 200 fathoms. Many of the mountains rise to a height of 2,000 feet, while Mt. Elias, on Negropont, or Eubœa, exceeds 4,000 feet. On the summit of this mountain are the remains of an ancient temple of Neptune. The *Ægean* islands are generally divided into two groups, viz., the Cyclades, lying mainly along the European coast, and the Sporades, which border the Asiatic side. Most of the Cyclades belong to the Greek kingdom, while Turkey claims the Sporades. Many of the islands are picturesque in scenery, and all the arable portions are extremely fertile. The principal productions are silk, cotton, honey, wines, figs, raisins, oranges, and other tropical fruits. Coral and sponge are found among the Sporades, while the Cyclades furnish the pure white marble known as the Parian, from Paros, one of the group, where it was first worked. Here, also, were found (1627) the Arundel marbles, or Parian chronicle, so replete with historical interest. A peculiarity of the tidal wave is known to navigators in the channel of Negropont (anciently Euripus). The tide frequently runs in this channel, in a given direction, at the rate of 6 to 8 miles an hour, and then suddenly, without any known cause, sets in the opposite direction, at nearly the same rate. The climate of the islands is salubrious, the inhabitants hardy, and the women noted for beauty. Bordering upon the ancient kingdom of Greece on the west, and upon the seat of "the 7 churches which were in Asia" on the east, the localities of the *Ægean* throng with associations, classic and sacred. II. The second in importance is the Indian Archipelago, which includes that extensive insular region of the eastern hemisphere, extending from the south-eastern coast of Asia to Australia, embracing the Philippine group, the peninsula of Malay, Sumatra, Java, Borneo, Celebes, and the Molucca and Banda Isles, and stretching between the parallels of 10° S. and 20° N. lat. and 98° and 180° E. long. This immense area is bounded by the Chinese sea on the north, and by Australia on the south, and has the Pacific on the east, and the Indian ocean on the west. The climate is warm, the productions various, and important to the civilized world, and the commercial capabilities of the entire group unlimited, though as yet comparatively undeveloped. Throughout nearly all the islands of this archipelago are found gold, iron, coal, copper, tin, antimony, and diamonds, while from its soil are produced cotton, coffee, sugar, indigo, tobacco, and spices. The manufactures are also important. Geologically considered, the Indian Archipelago seems to consist of a

nearly semicircular volcanic chain, around Borneo as a sort of central mass. While Borneo is not distinguished for mountains, a very well-marked chain of elevation may be traced, commencing at the northern extremity of Sumatra, thence extending S. and E., through Java, Lombok, Sumbowa, Flores, and Timor, where, curving to the north, it strikes the western extremity of New Guinea, whence it assumes a mainly north-westerly direction through the Molucca and Philippine islands to its terminus at the head of the Chinese sea. This entire range is of recent volcanic formation, and many of its volcanoes are still active. Borneo is evidently the oldest in elevation, having no volcanic disturbances, and the extensive deltas at the mouths of its rivers, a feature mostly lacking to the axis of elevation above described, attests the position assigned it as the nucleus of a circular and progressive upheaval. The population of the archipelago consists of two distinct races, the Malay, and the negro, the latter of which are in the lowest possible state of civilization, and are rapidly thinning out before the former, or brown race.

ARCHITECTURE, the art of construction or building, may be divided into 3 distinct branches—civil, military, and naval. It can be ranked with the fine arts so long only as it is practised in accordance with the principles of harmony discovered in nature. The art of building had its origin in the desire implanted in man to procure protection from the outward elements. Each tribe or people constructed, from the materials that presented themselves, such habitations as were best suited to this purpose, and, at the same time, most convenient otherwise. We thus find in countries remote from other nations, and where foreign influences did not exist, an architecture at once singular, and as indigenous as the vegetation itself. The *hypogæa* of the borders of the Indus, the Nile, and the Ganges, the temporary tents of the nomadic tribes of eastern Asia, the oaks of the Grecian forests, fashioned by the ingenuity of man into the humble cabin (the prototype of the principal Grecian order), are indubitably the primitive styles of the Egyptian, the Grecian, and the oriental structures. Anterior to the discovery of printing, the monument was the tablet upon which the various races chronicled for posterity the annals of their history. In the simple, unhewn altar, we recognize the genius of religion; we trace in it the germ of the development of human intelligence; it bespeaks faith, ingenuity, ambition. The ancient Babel, and the altars of Scripture—the monuments of Gilgal and Gilead of the Hebrews—the Celtic Dolmens, the Cromlechs, the Peulvens or Menheirs, the Lichavens (the Trelithous of the Greeks), the Nurhags, the Talayots, and the Tumuli (the Latin *Mercuriales*), are all symbols of pristine faith. With the pagan devotee, the art was made to conform to the moral attributes of the character of the deity in whose honor the monument was erected.

With the Greeks various styles of structure were thus instigated, from the early polygonal formations of the Phœnicians, at Astrea and Tyranthus, to the perfections of design, the imposing Doric, the graceful Ionic, and the magnificent Corinthian orders. Each nation, at every age, possessed its symbolic monuments revealing its conception of the attributes of the Infinite, with the exception of the Persians—who, as we learn from the Zend Avesta, worshipped in the open air, and who, according to Herodotus, possessed no temples, but revered the whole circuit of the heavens; and the Assyrians, whose Magi interpreted the silent stars, and worshipped the sun. Among such monuments, we must reckon as the chief the temple of Solomon, that sublime conception of the spirit of immateriality, true type, in its massive splendor, of a higher and purer belief; at Elora, the temple of Indra, sacred to Swargaa, the god of ether, which, according to the Puranas, was designed by Wiswakama, the *stapathi* or architect of the heavens. In China, the ancient Tings, Taas, and Mikosi, were temples of the gods, and the *mias* in Japan and Siam were sacred structures. The pyramids were symbolic emblems of the metempsychosian creed of Egypt. The Djebel Pharouni, the pyramids of Rhameses, the temples of Isis and Osiris, and the Memnon, bespeak, in their colossal size, a vast and boundless faith. Athens possessed her Parthenon, over whose magnificence presided Minerva Archegetea, and Rome her Pantheon, “shrine of all saints and altar of all gods.” Byzantium was adorned with the altar of a Christian emperor, her St. Sophia, the glory of the eastern church, with its dome, pendentives, and beautiful mosaic. The Caaba of Mecca, sacred to the Arab faith, contains the revered stone, changed in its tears from its pristine whiteness to a blackened hue, in commemoration of mortal sin; and at which shrine the golden antelopes were consecrated. Ancient Cordova had her mosque, on which the Moors spent the riches of their oriental taste. There is Cologne with its cathedral, the *chef d'œuvre* of the mediæval age, the perfection of Gothic art, the revealed conception of a gigantic intelligence, destined by Frederic Barbarossa to be the sepulchre of the Magi who came from the east to adore the Saviour. Modern Rome possesses her basilica of St. Peters, on whose sublime structure, amid the visible decadence of classic art, Michel Angelo lavished his genius.—Of the early achievements and of the progressive steps of the science of architecture, there remain but fragments, though sufficient, with the assistance of history, to teach us their antiquity. The epochs of advancement can be traced, progressively, from the early elements of structure to the more perfected styles. Throughout the whole globe, we find remains of edifices which proclaim an early possession of certain degrees of architectural knowledge. The most remarkable vestiges of these primitive structures, save the Celtic monuments, are those supposed to be the works of

the giants or Cyclops mentioned in the *Odyssey*. By whom they were erected, however, is unknown, though they have been attributed to the Pelasgians. The walls of their cities, of their sacred enclosures and tombs, were composed of blocks of stone of a polygonal form well adjusted. No cement was used, the interstices being filled with small stones. At times they present horizontal layers whose upright joints are variously inclined. Their entrance gates received different forms. The most common being quadrangular: composed of upright jambs, either perpendicular, or inclined, supporting a lintel. Others assume the shape of a pointed arch; the jambs gathering to a point at the summit. Examples also present themselves of truncated pointed archways over the lintel; an arch occasionally being constructed, discharging this member of the superincumbent weight. We are led to suppose that within their city walls, the habitations were erected without order, a place being reserved in the midst for public assemblies. Little is known of their domestic architecture, as there exist no vestiges of those palaces so highly spoken of by the ancient poets. Perhaps the most interesting of their structures are their circular subterranean chambers styled treasuries; they present vaulted ceilings, although not constructed on the principle of the arch—the vaulted form being obtained by horizontal annular layers, corbelling inward—the projecting edges of the stones being taken off after the construction was completed. According to Blouet they served for tombs as well as for treasuries. Internally, they were covered with sheets of bronze. At Mycene several examples are to be found.—The most ancient nation known to us who made any considerable progress in the arts of design, is the Babylonian. Their most celebrated monuments were the temple of Belus, the Kasr, and the hanging gardens which Nebuchadnezzar built for his Lydian bride, the wonderful canal of the Nahar Malca, and the lake of Palacopos. From the dimensions of their ruins can be formed an idea of the colossal size of the structures they composed. The material employed in cementing the burned, or sun-dried bricks,—and upon which hieroglyphics are to be traced, was the mortar produced by nature from the fountains of naphtha and bitumen at the river Is, near Babylon. No entire architectural monument has come down to us from the Assyrians, whose capital was embellished with the superb Kalla, Ninoah, and the Khorzabad; nor from the Phœnicians, whose cities, Tyre, Sidon, Arados, and Sarepta, were adorned with equal magnificence; nor from the Israelites, whose temples were wonderful structures; nor from the Syrians, the Philistines, and many other nations. Our want of thorough knowledge concerning the architecture of these oriental nations is attributable partly to the innumerable devastations which have taken place on this great battle-field of the world; but to the perishability of the materials that were employed,

such as gypsum, alabaster, wood, terra cotta, and brick, with which their ruins abound, we must likewise attribute, in part, this ignorance. From recent discoveries, we have been able to see the great affinity existing between many of the works of these nations and those of Egypt and Greece; in their sculptures and ornaments, for example, and in the coloring of the various parts of their structures—which were without doubt polychromatic. Of the very ancient Chinese monuments we have no trace, they having been destroyed by Tsin-Chi-Hoang-Ti upon his ascending the throne. Their pagodas are merely imitations of the design of the nomadic tent; while the renowned Chinese wall is among the most wonderful structures of the whole world. We find that suspension bridges existed in China at a period when they were unknown to other nations. Japan, Siam, and the islands of the Indian ocean, abound in ancient ruins once sacred to the divinities of the Buddhist faith. The massive temples of the Hindoos at Ellora, Salsitte, and the island of Elephanta, seem in their awful grandeur like the habitations of giants, on whose land some divine malediction has fallen. The Hindoos, in these colossal structures with their endless sculptured panels, their huge figures, and their astounding and intricate excavations, evince a perseverance and industry equalled only by the Egyptians. Their pagodas, towering in the air, are likewise wonderful architectural achievements quite as admirable as their hypogea. The Indian structures are remarkable for their severe and grotesque appearance. Their temples—whether of Brama, the creator of all, Vishnu, the preserver of all, or of Seeb or Sheva, the destroyer of all—exhibit a striking embodiment of the attributes of the deities in whose honor they were erected. A remarkable resemblance to the Hindoo constructions has been found in the religious monuments or *teocallis* of Mexico and Yucatan.—EGYPTIAN ARCHITECTURE. But the architectural types of these antique structures, sink into insignificance when compared with those of Egypt. The obelisks, pyramids, temples, palaces, tombs, and other structures with which that country abounds, are on a colossal scale, and such as can have been executed only by a people far advanced in architectural art, and profoundly versed in the science of mechanics. These works, like the Hindoo structures, were remarkable for their gigantic proportions and massiveness. Intricate and highly painted rilievo sculptures or hieroglyphics covered the entire extent of their walls. The prevailing monotony of the hieroglyphic designs which form the chief feature of Egyptian architectural decoration, was superinduced by the circumscribed and limiting laws of their religion. In Egyptian architecture we trace the elements of the early Indian school, blended with more harmonious combinations, as likewise the introduction of architectural orders. Beside skilled organization of parts, and a just appreciation of pleasing effect, their works in

their colossal features evince a thorough knowledge of the geometrical branch of the science of construction. The architectural genius of Egypt lavished its power on mausoleums, and on gorgeous temples to the deities, which, in their sublimity, inspire awe. The earliest works of the Egyptians are their hypogea or spea wherein their dead were interred, and which served also as subterranean temples. In these excavations, or caves in the flanks of mountains, square piers were reserved in order to support the superincumbent weight. They were covered internally with hieroglyphics and bas-reliefs, enriched with color. Subsequently, temples were constructed in the open air. At Amada exists, perhaps, the most ancient example of these temples. It is peculiarly interesting to archæologists, as it forms the connecting link between the superb edifices of the Pharaohs and their prototypes, the spea. It also furnishes us with the proto-Doric order, combining square pillars with cylindrical columns. The plan of the temples constructed by the Egyptians is very similar to that of their hypogea. They were generally approached by an avenue, on either side of which was a row of sphinxes, leading to the propylon, before which stood the obelisks, thus forming an entrance into an open quadrilateral court surrounded by porticos. Opposite this entrance was another leading into a spacious hall, whose ceiling was supported by columns. In the rear of this principal hall were one or more smaller ones. The walls, ceilings, and columns were decorated with figures in bas-relief and hieroglyphics richly colored. The colors most generally employed were yellow, green, red, and blue. Their palaces were constructed upon a plan very similar to that of their temples. We know little concerning the habitations of the great mass of the nation. According to some, houses were constructed in stories, whilst others assume that their temporary abodes were mere huts. This people lavished their wealth upon their tombs, and devoted their lives to the construction of their eternal homes. Beside their wonderful cities of the dead, hewn in rocks, or embedded in hills, the Egyptians reared their stupendous pyramids, the most gigantic monuments existing. In plan, they are perfectly square, their corners being directed toward the cardinal points, and their sides presenting nearly equilateral triangles. From the immensity of these constructions, some have suggested the probability of the existence of a natural rock or hill within. Whether or not the outer surface was smooth or graduated with steps, when finished, it is impossible for us to decide. The constructions of the Egyptians are in granite, breccia, sandstone, and brick, which different materials are adjusted with much precision. The huge blocks employed in their various monuments exhibit a perfect acquaintance with the laws of mechanics. We cannot but wonder at their monolithic obelisks, especially when we reflect upon the immense distances they had to

be transported. The pyramidal shape pervades most of their works; the walls of their temples inclining inward. The jambs to their entrance gates also were generally inclined. The Egyptians never used columns peripterally even under the dominion of the Greeks and Romans; when the column was used externally, the space intervening was walled up to a certain height. To these circumstances, together with the fact that their monuments were terraced, can be ascribed their massive and solid appearance. With them, columns were employed to form porticoes in their interior courts, and also to support the ceilings. The shafts, of different forms, being conical, or cylindrical, or bulging out at the base, sometimes presented a smooth surface; they were rarely fluted, being generally covered with hieroglyphics. Occasionally, they were monoliths, but were generally constructed in layers, and covered with hieroglyphics; a circular plinth formed the base. The capitals resemble the lotus, at times, spreading out at the top; again, the flower appears bound together, assuming the bulbous shape; above is a square tablet forming the abacus. Others, of a later date, present projecting convex lobes; whilst other capitals are composed of a rectangular block with a head carved on either side, surmounted by a die also carved. Caryatic figures were also employed by the Egyptians, and were generally placed against walls or pillars, thus appearing to support the entablature, composed of a simple architrave and a coved cornice, with a large torus intervening, which descends the angles of the walls.—**GRECIAN ARCHITECTURE.** The Pelasgians appear to have been the first people settled in Greece, numerous remains of whose structures are still extant. Subsequently, from the knowledge possessed by the indigenous tribes, together with that acquired from the Egyptians and the Asiatic nations, the Greeks extracted and developed a style peculiarly their own; and architectural art passed from the gigantic to the elegant and classic forms. During the reign of Pericles it flourished with meridian splendor, and some of the most superb edifices the world has ever seen, were erected during this period. The Grecian monument belonged to the nation, and upon the public works of the country the government lavished fabulous sums. Heeren informs us, that the Greeks placed the necessary appropriation of funds for the public works at the head of the government expenditures. The thoughts of the whole Grecian nation, it would seem, were turned toward the adornment of the country. They forbade by law any architectural display on private residences, and in fact, until after Greece became subject to Macedonia, architects were permitted to work only for the governments. The Greeks loved recreation, and the government, as a political necessity, provided the populace with amusements. Hence the Grecian cities were adorned with temples, theatres, odeons, gymnasiums, choragic monuments, and the like.—The Gre-

cian temple consisted of a pronaos or vestibule, and a naos or cella. These sometimes were accompanied by an opisthodomus, supposed to be the treasury, together with a rear portico, or posticum. According to the disposition of the columnar decoration, they were styled in antis, prostyle, amphiprostyle, peripteral, dipteral, pseudo-peripteral, or pseudo-dipteral. The principal front of those in antis presents columns in the middle, with antæ on either side, supporting the pediment; in the prostyle, the antæ are replaced by columns; the amphiprostyle presents a similar disposition in the rear as well as the front; the peripteral presents columns forming a portico around the cella; when the lateral columns were engaged, instead of isolated, the temple was styled pseudo-peripteral; the dipteral offered a double colonnade around the cella; in the pseudo-dipteral, one of the ranks of columns was engaged in the wall. They are termed tetrastyle, hexastyle, octastyle, according to the number of columns supporting the pediment.—Their temples were generally cleisthral, or covered; those erected in honor of superior deities were hypæthral, or open to the skies. In these latter, the cella was divided longitudinally into 8 naves by a double row of columns, which supported the roof covering the side aisles. In order to save room, these rows of columns were in 2 stories, as thereby they were enabled to attain the desired height with columns of a less diameter. The ceilings of the porticoes were subdivided in caissons, oftentimes highly colored, as were likewise many parts of their edifices. The frieze below the ceiling, on the exterior of the cella walls, was often ornamented with bas-reliefs. The walls, internally, were decorated with paintings, though it is supposed that generally these latter were not executed directly on the walls, but were suspended against them. The pavement of the cella was usually elevated above that of the portico. That of the Parthenon, however, is level throughout. Opposite the entrance-door was placed the statue of the deity of the temple, which was often of colossal size; whilst others were arranged on either side of the cella, or about the principal deity. They were generally in marble or bronze; sometimes, however, they were of ivory and gold. Beside the different statues of their divinities, the cella contained altars, tripods, thrones, arms, vases, and utensils of different sorts; all of which objects were generally in precious materials, highly wrought.—Their more important temples were built on sacred ground; within the peribolus or enclosure were sacred groves, grottos, altars, columns, statues, &c. The entrance-way or propyleum, somewhat similar in plan to the pronaos of their temples, was grand and imposing. Little is known of their theatres and odeons; the graded hemicycles of the former, destined for the spectators, being all that now remain of them. These hemicycles were excavated in the side of

a hill. Of the choragic monuments, that of Lysicrates at Athens is the finest example; upon a quadrangular basement, was placed a cylindrical monument with engaged Corinthian columns supporting an entablature surmounted by a dome crowned with a beautiful acroteral motive, upon which was supposed to have been placed a tripod.—Their agoras, or public places of assembly, were surrounded by porticoes decorated with paintings, commemorative of glorious achievements. Within the enclosure were temples, altars, and statues dedicated to their heroes. We know little of the architectural arrangement of their gymnasia, which contained the halls, porticoes, and exedrae, where the sages taught their different philosophies; their baths, accompanied by their dependencies, about which were disposed the stadium, and courts for various gymnastic exercises. It is likewise difficult to obtain any accurate idea of the architectural disposition of their domestic habitations, as no examples remain. The beauty and grace which pervade all of their works, whether monumental, mechanical, or industrial, lead us to suppose that, although imperfect as regards comfort, they must yet have exhibited a certain degree of elegance. A just idea of the mouldings and ornaments, unequalled for their purity and grace, can be obtained only from personal observation. It is also impossible, from any verbal description, to be able fully to appreciate the beauty and harmony of their different styles. It may be well, however, here to lay down some general principles.—These styles may be classed in systems or orders: the Doric, Ionic, and Corinthian. They also employed, though rarely, caryatides. Innumerable conjectures exist concerning the origin of these different orders. In all probability we are indebted to the Dorians for the invention of the Doric; although Champollion sees in an Egyptian order, which he styles the proto-Doric, the type of the Grecian order of that name. The oldest example extant is at Corinth.—To the Ionians, likewise, is attributed the honor of having first employed the Ionic order, no example of which is to be found in Greece, prior to the Macedonian conquest. As for the origin of the Corinthian, without wishing to discredit the interesting narrative of Vitruvius, wherein he accords to Callimachus the invention of the Corinthian capital, it might be well to state, that foliated capitals of much greater antiquity than any discovered in Greece, are to be found in Egypt and in Asia Minor. The most perfect Grecian example of this order is employed in the choragic monument of Lysicrates.—Little doubt need be entertained as to the Greeks deriving the idea of their caryatic order from the Egyptians, who often employed human figures instead of columns in their structures.—The Doric holds the foremost rank among the Grecian orders, not only on account of its being the most ancient, the most generally employed, and consequently the most perfected; but more especially because of

its containing, as it were, the principle of all their architecture, as well as an exact imitation of all the parts employed in their primitive constructions, which were undoubtedly of wood. Thus we see the post represented by the column, the wall-plate by the architrave, the extremities of the joists by the triglyphs; the rafters naturally produce the projection which composes the cornice; while the double pitch of the roof gives us necessarily the form of the pediment.—This style, typical of majesty and imposing grandeur, was almost universally employed by the Greeks in the construction of their temples; and certainly monumental art does not furnish us with the equal of a Greek peripteral temple.—The Grecian Doric may be divided into 8 parts: the stylobate, the column, and the entablature. The stylobate is formed by 8 receding courses, together about equal in height to the inferior diameter of the column, which dimension is generally used as a measure of proportion in describing the orders. On the uppermost course stands the column, from 4 to 6 diameters in height, and whose diameter at top is about three-fourths of that at base; the shaft thus assuming a conical shape (which diminution, in a slightly curved line, is styled *entasis*), generally bears 20 shallow flutes, their sections forming segments of circles, or similar curves which meet and form a sharp angle. At the base these flutes detail on the pavement; they pass through the hypotrachelium, and terminate beneath the anulets of the capital, either in a straight or curved line. Upon the shaft is placed the capital, nearly one-half of a diameter in height, composed of an abacus, or square tablet, about $1\frac{1}{2}$ diameter in width, and one-fifth in height. This member is supported by the echinus, of about the same height when there is a necking, but occupying a greater proportion when none exists. This echinus or ovolo bears 8, 4, or 5 rings at the bottom, where it dies away in the shaft.—The axes of the columns were slightly inclined. According to Villeroy, in a rectangular temple, planes passing through the centres of the columns would meet in a straight line; in a point, if the plan of the temple were square; the columns at the angles following in both cases the direction of diagonal lines. This inclination does not commence until the second course, or about one-tenth of the height of the column, if monolithic. The first course being an oblique truncated cone, determines the angle of inclination; the remaining courses forming the column are upright truncated cones, perfectly adjusted one to the other. The inclination of each column is proportional to the distance, to the line joining the foci, if the monument be rectangular, or to the centre of the plan of the edifice, if square. Thus the columns at the angles are the most inclined, those in the middle of the sides the least.—The entablature, about 2 diameters in height, is subdivided into 3 parts: the architrave, the frieze, and the cornice. The architrave occupies about two-fifths of the whole

height, being perfectly simple, crowned by the *tænia* or continuous fillet, one-tenth or one-twelfth of its entire height; below this fillet, under the triglyphs, is a regula, of the same height, from which depend 6 cylindrical drops. The face of the architrave is generally in a vertical plane tangent to the base of the columns. The frieze, of about the same height as the architrave, is terminated on top by a projecting fascia, occupying about one-seventh part of its whole height, which breaks around the triglyphs, where it is slightly increased in depth. Horizontally, the frieze is subdivided into triglyphs and metopes, which regulate the intercolumniation in the following manner: A triglyph about one-half a diameter in width, is placed exactly over the middle of each column, and one in the intervening space. They are separated by the metopes, which in width are equal to the entire height of the frieze. This distribution differs, however, at the angles; here the outer edge of the triglyph is in the same perpendicular line with the circumference of the base. Thus the first intercolumniation, counting from the angles, is contracted. The Greeks also gave a greater diameter to the columns at the angles. The triglyph is subdivided into 2 glyphs, each one-fifth of the whole width (a triangular fluting or channel formed by the intersection of 2 vertical planes inclined inward from the face of the tablet) of 2 semiglyphs, and 2 interglyphs, each one-seventh of the entire width. The glyphs detail on *tænia*. Above they are sometimes square-headed, sometimes curved; the semiglyphs finish with a curve at the top. The surface of the interglyphs is in the same plane with the architrave. The metopes recede from the triglyphs, and were oftentimes decorated with sculpture.—The cornice, projecting about its own height, is composed of a corona, about one-half of the whole height, crowned by a square fillet supported by a congeries of mouldings, together about one-half of the height of the corona, which latter has on the lower edge a sunken face bearing the mutules and guttas, which form the soffit or planceer of the cornice, inclined up inward at an angle of about 30°. The mutules are placed directly over the triglyphs and metopes, and are exactly equal to the former in width. They are ornamented with 8 rows of cylindrical drops. The height of the pediment is generally about 1½ diameter. The cornice-crowning inclined sides of the tympanum, differs from the horizontal one at its base, inasmuch as the mutules are left out, and another member superimposed, which is either an ovolo with a fillet, or a cymatium, occupying a space equal to about one-half the depth of the cornice with its mutules. The tympanum was often decorated with sculpture. The flank cornice supported *antifixæ*, an ornament used to cover the ends of the joint tiles of the roof. The *antæ* or pilasters, nearly equal in diameter to the columns, did not diminish at the top, nor were they fluted like the columns; they generally had a conge-

ries of mouldings at the top and the bottom. The Greeks never employed peripterally any other than the Doric order.—The Ionic, remarkable for its grace and suavity of proportions, holds a *juste milieu* between the simple Doric and the rich Corinthian order. According to some, it was originally employed in funeral edifices. At Telemisus, in Lydia, are to be found tombs cut in the rock, which invariably offer examples of this style; moreover, on the Grecian vases the representation of the Ionic column is symbolical of a sepulchral monument. This order, as well as the Corinthian, is more tractable than the Doric. Like the latter, it is composed of stylobate, column, and entablature. The column has a base as well as a capital, and is about 9 diameters in height. The base, about one-half a diameter in height and 1½ in width, is composed of a torus resting on the stylobate, a scotia and a second torus, all about equal, and separated from each other by a fillet, one also finishing the apophyge, or escape of the shaft, which diminishes with entasis about one-sixth of a diameter, bearing 24 flutes deeper than in the Doric column, and which are separated from each other by filets. These flutes finish in same curve above and below. The capital is about one-half of a diameter in height, when unaccompanied by a necking; when one exists, it is about three-quarters high. The volutes carved on faces of a parallelogramic block, and connected at sides by bolsters, and in front by flowing lines, are supported by a congeries of mouldings, composed of a bead and ovolo. Superimposed is an abacus. These volutes are a full half diameter in depth, and extend in width about one diameter and a half. When this capital is accompanied by a necking a torus is introduced in corbel mouldings, supporting the volutes, and the necking itself, ornamented with the honeysuckle and tendrils, is separated from the shaft by a fillet, or a bead. The outer volute of capital at the corners is inclined at an angle of 45°, so as to present a volute when viewed from either side; internally the two volutes meet at right angles.—The entablature, a little over two diameters in height, is composed of architrave, frieze, and cornice. The former occupying about two-fifths of whole height, contains three equal fascias, slightly projecting one beyond the other, the lowest one being in a plane tangent to the inferior circumference of the column. On the upper edge of the architrave are a few corbelling mouldings comprising a little less than one-quarter of its whole height. The frieze is of the same height with the architrave, recedes slightly, and is either plain or ornamental with sculpture. The projection of the cornice is about equal to its height. It is composed of bed-mouldings undercutting the corona; this latter is of great breadth, and the crown mouldings are of much less importance than in the Doric. The pediment of this order is also rather lower, and its cornice is crowned by a rectangular fillet

surmounting small mouldings. The intercolumniations differ from 2 to 3 diameters. —The only example of the Grecian Corinthian is to be found in the choragic monument of Lysicrates, which is a small circular structure decorated with engaged Corinthian columns, placed upon a high rectangular basement. This order is composed of a stylobate, a column, and entablature; the former occupying in height a little more than one diameter. The column is about 10 diameters high, has a base somewhat similar to the Ionic, between one-third and one-half of a diameter in height, and in width rather more than one diameter and one-half. The shaft, whose top diameter is about five-sixths of that at the base, bears 24 flutes nearly semicircular, terminating at the bottom in the same curve, and at the top in leaves, the fillets forming stalks. The capital separated from the shaft by a groove, is a little more than $1\frac{1}{2}$ diameter in height. Its cylindrical body is surrounded at the bottom by a row of water leaves occupying about one-sixth of the entire height. Above them exists a row of acanthus leaves twice as high as the former, seemingly buttoned on. Between this second row and the abacus are helices and tendrils, the latter supporting honeysuckles in the middle of the abacus, which member is about one-seventh of a diameter in height, and in plan presents a square with concave sides whose angles are cut off at 45° ; its section presenting a fillet, on which reposes a cavetto and an ovolo separated by another fillet. The entablature is about 2 diameters and one-quarter in height, of which the architrave and cornice occupy separately rather more than one-third, and the frieze rather less. The architrave is divided into 3 equal fascias, inclined inwardly sufficient to bring the outer edges in the same plane with the inferior diameter of the column; these fascias together are crowned by corbelling mouldings being one-sixth of the entire height. The frieze is slightly inclined also and is sculptured. The projection of the cornice is about equal to its height. The bed mouldings have about two-fifths of this projection, and occupy five-eighths of the entire height of the cornice, undercutting the planer. Their principal feature is a dentilled member, it being more than one-quarter of the whole cornice in height. The height of the corona is only three-eighths of the cornice, and nearly one-third of this is taken up by the crowning ovolo and fillet. In this example the cornice is surmounted by a cut fascia supporting antixæ, somewhat similar to those employed on the flanks of Doric and Ionic temples. The intercolumniation is $2\frac{1}{2}$ diameters. —In the example offered us at the Acropolis of Athens the caryatides stand on a stereobatic dado, placed on the stylobate; the antæ bear the mouldings of the temple to which they are attached, forming base mouldings to dado which has also a cornice. The entire height of the stereobate is about three-fourths of that of the figures, taken together with their base and cap-

ital: the former is a square tablet or plinth, the latter a circular moulded block crowned by an abacus. The entablature is about two-fifths of the height of the figures, and is nearly equally divided between architrave and cornice. The upper of the 3 fascias of the architrave is ornamented with circular discs. The cornice is composed as usual of bed-mouldings, corona, and crown-mouldings, the former with dentilled member forming about two-fifths of the whole height. —ETRUSCAN ARCHITECTURE. The extreme obscurity of the Etruscan history has rendered it difficult for antiquarians to decide any thing positive in relation to the origin of that people. In addition to the indigenous Etruscans, we find an admixture or blending with the Pelasgic or Grecian colonists, who settled in Italy, according to Micali, during the century preceding the Trojan war. The polygonal formations observed in the walls of Etruria belong to the Pelasgic civilization, and are similar to those of Hellas and of Asia Minor. —The commercial relations existing between the Etruscans and the Hellenes of Asia Minor and Magna Græcia, account for the existing similitudes in their artistic productions. The ceilings of the hypogæa, hewn so as to represent caissons, tend to corroborate the idea that their earliest structures were of wood, which, with them as with the Greeks, became the archetype of their structures in stone. To the Etruscans the invention of the arch, constructed on its true principles, has been generally attributed, as likewise the composition of an order styled Tuscan, a species of simple Doric, no entire example of which, however, has been handed down to us by the ancients. —ROMAN ARCHITECTURE. The history of Roman architecture, under its kings and at the beginning of the republic, is somewhat obscure, as but few of the monuments of that period remain. The Roman kings fortified the city, and erected various palaces, temples, and tombs. It became adorned with colossal works of art, whose stupendous features forming such a contrast with the comparative insignificance of its power and condition would seem to indicate that the future of imperial Rome had been foreshadowed to its people. The early Romans employed Etruscans in their works. When Greece at length fell under the yoke of the Roman empire, Rome became enriched with the spoils of Athens. The Greek artists sought protection and patronage among their conquerors, and adorned the imperial capital with structures which called forth unbounded praise. The Grecian style was blended with the Etruscan during the more early period of the Roman school. But as the arch, which was the characteristic feature of Roman architecture, revealed its treasures, the Grecian elements were employed but as a system of ornamentation. Thus, oftentimes, the column no longer served as a support, but was merely used to decorate the pier or wall from which the arch sprang. Great discussions have arisen, and still arise, as to who were the inventors of the arch. In

Etruria are found many monuments wherein its design exists, and which are of an anterior date to the construction of the *cloaca maxima* (wherein it is fully developed), and even to the foundations of Rome. Whether the Romans have a just claim to the discovery of the arch, it is impossible to say positively; it is more than probable, however, that the arch originated with the Etruscans, but owed its useful application to the Romans. With its introduction came various important modifications in architecture. Arcades were substituted for lintels. With the assistance of the arch great spaces could be covered, and the various combinations of vaulted ceilings naturally ensued.—The early Roman structures were of stone. Subsequently the mass of the constructions was of brick, externally decorated with slabs of marble, and similarly decorated internally, together with stucco work. Bricks seem to have been used by the Romans, partly in consequence of the facility offered by this material for the construction of the arch, and partly because they had but little marble. It has been supposed that the necessary economy of the material used in building developed the mechanical powers of the Romans, and that by this taxation of their ingenuity they discovered the principles of the arch. No nation presents so great a variety in their constructions as the Roman. Stone, terra cotta, bricks, and marble, were ingeniously put together in various ways. They were especially renowned for their hydraulic works. The edifices of the Romans display a taste for the luxurious and the magnificent rather than for the harmonious and beautiful, which sentiments pervade the Grecian monuments. In their interiors especially are we struck with the gorgeousness of their decoration. Their exterior pavements were variously composed of stone, tiles, marble, porphyry, and other durable materials laid in cement. Internally their floors were similarly laid in mosaic work. This style of work is supposed to have originated among the eastern nations, subsequently being employed by the Egyptians, Greeks, and Romans. Their walls were stuccoed and decorated with paintings in the arabesque style, or covered with various marbles, alabaster, and jaspers, while their columns also were of granite, marble, and porphyry. This luxury strikes us the more forcibly, as these apartments so richly adorned and containing various *chef-d'œuvre* of art, were but very imperfectly lighted; in fact, they were sometimes wholly dependent upon lamps. This, too, is one of the glaring defects in their dwellings, as can be clearly seen at Pompeii. Their houses generally presented an entrance on the street, accompanied by shops, if in a principal thoroughfare, leading into an *atrium* or court, with compluvium in the middle and porticoes on the sides connecting with the rooms occupied by the servants. This court connected with another in the rear also surrounded by a portico, which led to the apartments of the master.

But nowhere is this taste for richness rather than simplicity more evident than in comparing the details and mouldings of these two people. It is due them, however, to make an exception in favor of their Corinthian order which they employed as universally as did the Greeks the Doric, and to their structures must we turn for many of the finest types of this order. The column varying in height from $9\frac{1}{2}$ to 10 diameters is composed of base, shaft, and capital. The base, about one-half of a diameter in height, in some cases consists of 2 tori and a scotia with intervening fillets, placed upon a plinth as in the examples of the temples of Antoninus and Faustina, of Vesta and of Assisæ; whereas, in the temples of Jupiter Tonans, of Castor and Pollux, and in the portico of the Pantheon, there exists a double scotia. The shaft diminishes with entasis about $\frac{1}{4}$ of a diameter, and is generally fluted when the material permitted. These flutes were semicircular, separated by fillets, one-quarter of their width, and 24 in number. At the upper extremity, the fillet above the cavetto supports a small torus, on which rests the capital, about one diameter, and $\frac{1}{2}$ in height, composed of 2 rows of 8 acanthus or olive leaves. The lower row, about $\frac{1}{4}$ taller than the upper one, occupies about $\frac{1}{4}$ of the whole height of the capital. The leaves of both finish on the hypotrachelium. Above are helices and tendrils trained with foliage, surmounted by an abacus, composed of a cavetto, fillet, and ovolo forming together $\frac{1}{4}$ of the entire height, and which in plan presents a square with the corners cut off; the sides being concave segments of circles, in the middle of each of which is placed a flower or rosette. The entablature is about $\frac{1}{3}$ of the column in height, $\frac{2}{3}$ of which being occupied by the architrave, together with the frieze. The former being divided into 8 unequal fascias, generally separated by a bead and a cyma-reversa, and crowned by a small congeries of mouldings, the first fascia impeding the shaft at top. The frieze is generally enriched with sculpture. The bed mouldings of the cornice, when decorated with modillions, occupy about $\frac{2}{3}$ of the total height; when no modillions exist, only one-half is taken up by them. They generally consist of a bead, a cyma-reversa, and a fillet, a vertical member dentilled or not, another bead and an ovolo, supporting a plain vertical face, $\frac{1}{4}$ of bed mouldings in height, which bears the modillions, and which is surmounted by a cyma-reversa, which breaks around the same. The modillions are horizontal consoles, in width equal to their height, bearing large volutes at inner end and smaller ones at the outer extremity, joined by a graceful curve, underneath which spreads an acanthus leaf; the space between them is about twice the width of the modillion itself. Resting upon the modillions is the corona surmounted by a small congeries of mouldings, a cymatium, and a fillet. The planocœr of the corona is offered between the modillions, in the centre of each is placed a rosette.—The com-

posite order may be considered as a sort of Corinthian, as the principal difference exists in the capital, where the volutes occupying about one quarter of the total height rest upon a bead and ovolo; the central tendrils are also omitted, and the upper row of leaves is higher than in the ordinary Corinthian. Beside this particular composite capital, the Roman monuments furnish us with others ornamented with trophies, eagles, masks, &c. The pediments of the Roman edifices were steeper than those of the Grecian. The cymatium of the same was continued along the flank cornices, thereby doing away with the antefixa. The Doric order, on account of its simplicity, was very rarely employed by the Romans. In the few examples which have been preserved, the proportions are more slender, the projections less hardy than in the Grecian Doric; and, in endeavoring to give it more elegance, this order lost with the Romans its simplicity and grandeur. At Albano an example has been discovered where most of the mouldings are ornamented. The baths of Diocletian furnish us with still another example greatly enriched. The necking is ornamented with small rosaces, the echinus is sculptured with leaves, the metopes and corona are also enriched with sculpture, while the cornice resembles that generally employed in the Ionic order. The best examples of this order, handed down to us by the Romans, decorate the temple of Hercules at Cora, and the theatre of Marcellus at Rome. In this latter example, the column composed of shaft and capital is about 8 diameters in height. The capital, occupying about one-half of a diameter in height, may be divided into 3 nearly equal parts. The uppermost given to the abacus of less projection than in the Grecian examples, is crowned by a cyma-reversa and fillet; the ovolo supporting the abacus is a semi-torus resting on 3 fillets, occupies the middle division, whilst the lower third is taken up by a necking which is separated from the shaft by a small torus and fillet. The shaft, less conoidal than in the Grecian examples, is without flutes, the superior diameter being about four-fifths of the diameter at the base. The total height of the entablature is about one-quarter of that of the column; its projection is about equal to its height. The architrave is one-half of a diameter in height; the frieze one diameter and one-half. The principal difference in the distribution of the Grecian and Roman Doric frieze is in the position of the triglyph over the column at the angle. The Romans preserved the same intercolumniation throughout, and placed the triglyph directly over them, thereby forming half metopes at the angles. In the cornice the bed-mouldings occupy more height than in the Grecian types, and are composed generally of a cyma-reversa, dentil, and ovolo, separated by fillets. The corona is of less importance, it being sacrificed to the cymatium, which in return is of more value than in the Grecian Doric. The planceer generally bears mutules,

though sometimes these latter members are dispensed with. The only examples of the Ionic order in ancient Rome are to be found in the two temples near the theatre of Marcellus, in the temple of Manly Fortune, in the baths of Diocletian, in the Colosseum, and in the upper order of the theatre of Marcellus. The total height of the columns varies between 8 and 9 diameters. The base, about one-half of a diameter in height, is composed of a torus resting on a plinth, a scotia and a second torus; the three upper members have fillets intervening. The shaft slightly increased in diameter at one-third of its height, is either plain or fluted; in the latter case the flutes, separated by fillets, are semicircular, and are 20 in number. The diminution of the shaft varies between one-eighth and one-tenth of a diameter. The capitals, occupying about one-half of a diameter, vary; those of the theatre of Marcellus, and of the temple of Manly Fortune, are without a necking. The volutes connected by horizontal instead of curved lines are bolstered, and the abacus crowning the volutes is composed of a cyma-reversa and a fillet. In the Ionic capitals of St. Lawrence at Rome (generally thought, formerly, to have belonged to the temple of Jupiter and Juno), there exists a necking. The temple of Concord presents still a third species, the volutes being doubled and inclined at an angle of 45°. The height and projection of the entablature are nearly equal, varying between one-quarter and one-fifth of the height of the column. The architrave and frieze are equal in height, and are a little less than that occupied by the cornice. The frieze is either with or without sculpture. The bed-mouldings of the cornice generally consist of a cyma-reversa, a dentil course, and ovolo, separated by fillets; together occupying rather less than one-half of the entire height of the cornice; the corona and crown mouldings, with the cymatium, complete this order. The whole of the Roman possessions were covered with massive structures which embodied the Roman spirit of defiance and the supremacy of the conqueror. But the gigantic features of Roman architecture were revealed in all their glory within the precincts of the Seven Hills; and although Antioch and Baalbec were adorned with architectural masterpieces, as well as parts of Africa and Palestine, and the greater part of western Europe, still the powerful and vital essence of Roman art shone with its most dazzling magnificence in the plains of the classic Campagna. It would be in vain to attempt to describe the various constructions of utility and splendor with which Rome and her possessions were covered. We find everywhere in her own limits and in her possessions, roads, aqueducts, bridges, ports, forums, basilicas, temples, mausoleums, palaces, baths, theatres, amphitheatres, hippodromes, naumachias, triumphal arches, cloacas, prisons, fountains, cisterns, monumental columns, villas, grottoes, and markets. During the reign of Augustus, Rome was

adorned with its beautiful Pantheon, and Asia was endowed with many beautiful structures, and Athens itself became embellished with the famous temple of Jupiter Olympus. The baths, or *thermae*, of Augustus, Nero, Titus, Caracalla, and Diocletian, were renowned for a magnificence which was hardly surpassed even by their palaces. In fact, throughout all the Roman structures, from the palace of the Cæsars to the villas of Adrian, Sallust, and the epicure Lucullus, the greatest display of splendor and luxury prevailed. But, of all their structures, perhaps the most stupendous was the Colosseum, the Flavian amphitheatre, capable of containing more than 100,000 spectators. It was partially destroyed by Robert Guiscard the Norman, in 1084, from his having conceived the idea that it was to be used as a citadel against him. Though from the ruins the popes have taken sufficient material to construct the palaces of the Farnese, the Cancelleria, and that of St. Marks, still the cragged and crumbling remains are gigantic and imposing.

—ARCHITECTURE OF THE MIDDLE AGES. But the spirit of classic art seems to have waned with the glory of the Roman empire. The science of building became perverted, and the fame which the Romans had attained in architecture became a memory only. Christianity with its regenerating power revived the spirit of religious zeal which again became, as in olden times, the instigator and prime motor of artistic embodiments of adoration, and the imperial basilica became the temple of the most high God of the Christian. The architecture of this period was composed of Greek and Roman details, combined under new models and forming structures wholly different from the antique originals. Through many successive centuries, the Roman school of art continued to suffer changes. From the fragments of edifices which were torn down to form new structures, arose combinations at once singular and corrupt. The transition styles which then prevailed were, from their characteristic peculiarities, designated as the Latin, the Byzantine, the Lombard, the Saxon, the Norman, and the Romanesque, together known as the old Gothic. During the 4th century architecture had reached the very acme of its decadence. In the religious edifices of this period marked evidences exist of an utter want of artistic feeling. The sterling principles which had been the glory of Roman and Grecian schools, were either forgotten or not understood. Encouragement to artists was not wanting, for Constantine repaired the ancient monuments and constructed others. The large sums appropriated by this emperor for the establishment of architectural schools throughout his dominions, could not have failed of the happiest results, had not the taste for artistic beauty disappeared to make room for that of a meretricious splendor. Great liberties were taken during this period with all the architectural members. Arches with and without archivaults were made to spring immediately from

the capitals of the columns. Orders were superimposed with broken entablature; in fact, this latter member was altogether done away with in some cases. Grace was wanting in the mouldings and sculpture; the different orders were employed in the same peristyle, and the whole school of architecture became the prey to the general system of innovation which then existed. It appeared to disencumber itself of the thralldom of traditionary rules, and to seize, as if at random, upon designs which seemed to meet the exigencies of a new faith. It was, in fact, the style of a people morally transformed, but whose social exterior was still pagan. This condition of things continued under Constantine when the arts dwindled into comparative insignificance. During this state of things, hordes of barbarians invaded every province of the empire. This universal conflict was not calculated to give a new impetus to architectural art, nor to promote its progress. Italy, however, under the Goth and Ostrogoth rule, evinces in some measure a renewed architectural zeal. Theodoric repaired the walls and drains of Rome, reorganized the *Comitia Romana* (who guarded day and night the monumental structures of the capital), and by his own devotion to the arts, together with that of his daughter, Amalasontha, revived the spirit of a fast perishing craft.—After the transfer, by Constantine, of the imperial seat to Constantinople, the arts were again successfully cultivated by the Greeks, who made free use of the architectural treasures left by the ancients. Then appeared the dome, the glory of the Byzantine school, supported by its pendentives highly ornamented with mosaic. This principal feature of the Byzantine school, induced their architects to abandon the Latin cross (which form had gradually grown out of that of the Roman basilica), in the plan of their churches: introducing, instead, the Grecian cross, whose branches are of equal length. The central dome no longer rested on circular walls, but was borne by 4 arches resting on pillars placed at the 4 angles, in plan. Pendentives were introduced in order to sustain the circular dome, as otherwise the triangular space in the 4 corners would have been left without support, the diameter of the dome being equal to one of the sides of the square. In some cases the corner pillars were square, presenting an angle only at the corners, thereby giving an extraordinary degree of lightness to the structure. The semicircular arch of the Romans was often elongated, in order to attain an equal height with different spans. The dogmas of the Iconoclasts obliged the architects to seek some other means of enriching their temples; hence the profusion of mosaic work. Their sculptured ornaments represented foliage in bas-relief, and interlaced lines. The capitals of the columns were square blocks similarly carved, tapering down at angles to join the circular shaft. In their style of decoration, as well as in various other particulars, they seem to have

been influenced by the Mohammedans. Under Narses and Belisarius the dome was introduced into Italy and was seen adorning their edifices. The Byzantine style, whose chief promoters were Anthemius of Tralles, and Isidorus of Miletos, became the basis of the modern Persian, Russian, and Moslem schools. We find its peculiarities existing during the middle ages in Greece, Italy, Sicily, Spain, Arabia, and India. Among the chief edifices of the Byzantine school may be instanced that of St. Marks, at Venice, that of St. Vitalis, at Ravenna, and that of St. Sophia, at Constantinople,—the latter being one of the most magnificent of the eastern empire. The Arabs, the Saracens, and the Moors, introduced into Europe certain forms of architecture which, though differing in very many features from the classic styles, were still founded on the remains of the Grecian school, blended with the oriental elements of the Byzantine. The chief peculiarity of these styles was in the form given to the arch. The Saracenic arch was of greater depth than width. The Moorish style was distinguished by arches in the shape of a horseshoe or a crescent. The Saracens and Moors are, however, so completely one people, that it is with difficulty that the differences of their essential features can be discriminated. Their mural ornamentation, styled arabesque, presented more varied designs of graceful and ingenious combinations of geometrical and floral traceries than had before been known. The reproduction of animated forms was prohibited by the sacred laws of the Koran. Another striking feature of this school is the peculiar way in which they ornamented their pendentives, by a series of small columns with little niches placed one above another, covering not only the surface of the inner, projecting angles, but forming at times the super-entablature of the edifice. The numerous mosques, palaces, bazaars, tombs, and other edifices of the Moslems, existing throughout various parts of Europe, Asia, and Africa, attest the great similarity existing between this style and the Byzantine; this is attributable to the employment of Greeks on their works. A fact worthy of note, also, is that the Moslem structures furnish examples of the pointed and ogive arches, whence according to many they were brought into Europe. The Lombards having possessed themselves of the Venetian territory toward the middle of the 6th century, there founded their kingdom, which lasted until 974, when Charlemagne subjected Italy to his power. Converted to Catholicism, the Lombards adopted the arts of the people they had vanquished; and, as in Lombardy there existed but few ancient temples whose materials could be employed in other structures, we find them originating a complete and systematized style, which at length pervaded all districts where the Latin church had extended its influence; the people of each country where it was introduced modifying it to suit their climate, customs, and wants. Its

branches are variously known as the Saxon, Norman, Merovingian, Carolingian, &c., which, together with the Teutonic, Moorish, and Saracenic, were styled old Gothic, and out of which grew the pointed style, after the introduction into Europe of the pointed arch. During this epoch, plain, banded, fluted, and polygonal columns, in spiral or zigzag, were clustered, broken, or knotted together. Their capitals were foliated or had various grotesque animals sculptured on them; they were supported on brackets variously carved, or rested upon the backs of animals, which replaced the pedestal. Every license was taken with their entablature, even to the suppression of it altogether. Against the jambs of arched openings were often placed numerous columns supporting the arched mouldings. Oftentimes a greater arch encompassed several smaller ones, supported by pillars which intersected each other in various ways. Their openings were quite elongated and often accoupled; the circular window, or rose, was also very frequent in their frontispieces. Semicircular, elongated, flat, horseshoe, and foiled arches are to be found, ornamented and simple, and serving either as a decoration, crowned their walls, or supported horizontal bands, dividing into panels their walls, which were likewise panelled off by long pilasters or flat buttresses. The angles of their churches (generally in plan in the form of the cross) were often surmounted by a sort of pinnacle. Ribs are also found in their vaulted ceilings. Towers first accompanied the churches, later they formed a part of the same edifice, flanking or decorating the middle of the façades. The earlier examples were square, afterward round, and subsequently of a polygonal form. The roof, assuming a more and more pointed shape, approaching the form of the spire, as it was introduced in countries where the climate was more severe. The monasteries and convents generally contained an interior court surrounded by porticos, about which were placed the cells of the inmates. The lower stories of the royal palaces and town halls also presented a similar disposition. External porticos, or lodges, also existed. During this period it is supposed that the construction of houses in stories became general.—The habitations of the mass of the people were poor and irregularly planted about the town hall, in the cities, or clustered about those massive structures (the feudal castles) erected as fortresses, into which the arrogant possessor might retire, and whence he might sally to harass the country at pleasure. These edifices consisted of a main tower, or keep, the walls of which were from 6 to 12 feet thick, with windows, consisting of holes 1 or 2 feet wide, placed at irregular intervals. The several floors were constructed on arches; the roof was flat, or had battlements, and possessed a notched parapet for the purposes of defence. The main tower was surrounded by a court-yard protected by a high wall, and the arched entrance was strongly secured by a

falling gate or portcullis. Around the whole was a deep ditch, or fosse, which could be filled with water. Many of the castle fortresses were on a plan of great magnitude, consisting of two or more towers and divers inner buildings, including chapels. During the gloom and the disastrous influences of the bloody wars of the middle ages, we find the venerable institution of freemasonry nourishing under the ashes of its ancient mysteries, the social life of architectural art. While the whole of Europe was convulsed with the international and social strife and invasions of barbarians which resulted in its complete reorganization, the study of the arts, sciences, and literature, took refuge in the monasteries.—In Italy during the 10th century we find the corporation of *Magistri Comacini* exercising great influence, and giving to Grecian artists shelter from the political troubles of the East, and from the persecutions of the Iconoclasts. These artists promulgated among the Lombards the Byzantine elements of structure, whose influence, as we have seen, was more or less felt throughout the architectural schools of Europe.—Under Erwin von Steinbach, of Germany, during the 13th century, the Hütten, or lodges, were organized, one object of which was the study of architecture, over which they exercised a powerful influence. In Strasbourg existed the lodge of the *Haupt-Hütte*. Under Godoyne, or Josse Dottzinger, of Worms (who, in 1444, succeeded the architect J. Hult), the various sects of the German freemasons were incorporated into one body, and, in virtue of an act passed at Ratisbon the same year, the architect of the cathedral of Strasbourg was elected the sole grand-master of the fraternity. These *magistri lapidum* were likewise sole directors or supervisors of all the religious structures. Protected by the church, sole depository of the arcana of the early masters, architecture passed from the old Gothic through various phases of the pointed or ogival styles. The influence, the enterprise, and daring achievements of its promoters seemed to strike the contemporary ages as well as posterity with a religious awe; and the intellectual power and energy of the people appear to have been concentrated and expended upon architecture. The revival of the spirit of emulation engendered by the impetus thus given to art would seem to have possessed a regenerating power, and to have resuscitated Europe from the condition of moral syncope into which it had fallen. The spirit of an age is embodied in its architecture. In the obscure depth of the vault of the so-called Gothic cathedral, the mind is inspired with solemn and devotional feelings. The style and decoration of the ancient Christian churches are by no means accidental. They speak a religious, figurative, and mystic language, and are symbolic revelations of faith. The cathedrals in the pointed style most justly deserve the admiration of the lovers of architectural beauty. The grand, bold, and regular proportions, the unwearied industry

displayed, the stupendous exterior masses, and the severe and awe-inspiring solemnity of the interior, call forth unbounded praise. The pointed style customarily is divided into 8 periods—the 1st, or primary, dating from the latter end of the 12th century; the 2d, or decorated, or *rayonnant*, from the commencement of the 14th century; and the 3d, or perpendicular, or *flamboyant*, from the end of the 14th century, which was superseded by the *REVIVAL OR RENAISSANCE OF THE 16TH CENTURY*. The essential element of this style is the pointed arch. Were it not for this feature it would be often difficult to distinguish between the earlier works of the 1st period of the pointed and the later works of the old Gothic. It is during the 1st period that the spire surmounting the tower becomes of so great importance, forming one of the striking characteristics of this style. In the finer examples it is octagonal and very pointed, either plain or ribbed, sometimes pierced, sometimes crocketed, and invariably bearing a finial. Buttresses and flying buttresses also form a striking feature—these latter being somewhat massive and heavy at first, but gradually becoming more and more elegant as they approached the 2d period. The *sets-off* are formed by inclined slabs, or by a pediment with finial, the face of the buttresses being ornamented at times with panels and niches; in some cases also the space between the arches of the flying buttresses is occupied by radiating columns. The parapet is uninterrupted, and is either decorated or plain. Turrets were either square or octagonal; their pinnacles being mostly of the latter form, either crocketed or not. The rose windows of this period are quite simple: small columns radiating from the centre receiving foiled arches tangent to the circumference. The lancet arch predominates. The windows are very long and narrow, and are either simple or coupled, in which latter case a slender column forms, as it were, the mullion. The ribs of the groined ceilings are decorated with bosses at their intersections, and rest either upon corbels, or upon the shafts of slender columns which descend to the pavement. The piers are either simple in plan, or present several shafts clustered around a core of a circular, elliptical, or cruciform shape. The sculpture, wherein the national flora is introduced, supersedes altogether the ornamentation previously employed; roses, trefoils, quatrefoils, and panelling, are introduced to ornament their works in various ways.—During the 2d period this style arrived at its apogee. A greater elegance and richness pervade this period, whose characteristic features are thereby distinguished from those of the previous one. The flying buttresses are extremely graceful, those at quoins being placed diagonally. The parapets are pierced or embattled, as are also the pediments. The windows gradually assume a less pointed form, the head of the arch being in general equilateral. Replacing the small

columns in the windows are moulded mullions, which form graceful flowing traceries in the head of the arch. Beside, the drip-stone is often surmounted by a canopy or pediment resting on masks, and enriched with crockets and a finial. The clustered columns comprising the columnar piers are more elaborate, and generally placed diagonally. Their bases become more important, and are placed upon octagonal plinths clustered together. The ribs, bosses, and carved ornaments throughout have more relief, and are more elegant.—The 8d period is remarkable for its profuse ornamentation. The panelled walls, with their niches, tabernacles, canopies, and screens, highly decorated; the flying buttresses enriched with pinnacles and tracery; the corbelled battlements and turrets, the balustrades, intricately carved and pierced, are fully characteristic of this epoch. The arch presents many varieties of form. Together with those common in the preceding periods, others exist very depressed; being, in many cases, almost flat. The ogee, or contrasted form, also appears in the openings and pediments. The doors are generally square-headed, the spandril above being enriched with traceries. The rose windows during the 15th century are most intricate in tracery. The groined vaults, also, are very elaborate, whilst their bosses and pendants are unequalled for their wonderful carvings. The mouldings of the archivolta, more prismatic in their forms than in the previous periods, continue down uninterruptedly to the foot of the openings; thus doing away with the columns heretofore employed. The appellations of perpendicular and flamboyant, by which this period is also known, arose from its peculiar mode of tracery.—With the reformation came the gradual abandonment of the pointed styles, accompanied as it was by the dissolution of freemasonry, occasioned by the withdrawal of the patronage of the pope. The consequent architectural reaction sprang less from admiration and a thorough knowledge of the classic styles, than from a necessity of returning to the antique. This style had lost its able promulgators, and with it the arcana of its system of architecture. The return, however, to the rules of the ancient schools of design, was progressive, save in Italy, where they had constantly exercised a powerful influence over the artistic spirit of the country, its architecture having retained through the middle ages the characteristics of the classic schools. We find here, however, several beautiful edifices, termed by the Italians *in maniera Tedesca*, which, notwithstanding the contradictory statements made by Muratori and Maffei, were the work of German artists. During the 14th century, or the trecento period, we discover in Italy, in the secular structures more especially, numerous examples exhibiting a return to the classic styles, which possess simplicity and boldness. At length, in the 16th century, the classic taste prevailed throughout Europe, and hence the different names, cinque

cento, renaissance, revival, given to that style which supplanted everywhere the so-called Gothic architecture. Brunelleschi of Florence was among the first to encourage and disseminate this taste for a return to the classic architecture. He had numerous distinguished followers; among whom were Bramante, Sangallo, Peruzzi, San Michele, Vitruvius, Alberti, Palladio, Scamozzi, and many others, who obtained a well-deserved reputation. In their productions, the different elements of the classic style are happily introduced. The application of these elements to ecclesiastical, and more especially to secular structures, accounts for the liberties taken with them, amongst which we will cite the following: the great variety given to the intercolumniation of columns; the superposition of different orders, with and without broken entablatures; the frequent use of engaged columns and pilasters; the various forms given to the pediments; the substitution of columns for piers supporting arcades; the decoration of blank walls with medallions, foliage, and scrolls of various sorts, together with designs of animals, arrayed in imitation of ancient arabesques. These, and many other so-called liberties, originated a style peculiarly well adapted to the wants of modern civilization. Michel Angelo made several innovations in architecture, as well as in the other arts. He abolished many capricious ornaments. And instead of superimposing several orders, distinguishing as many stories, he employed one, comprising the whole height of the edifice. To him we are indebted for certain bold elements of design, although generally wanting in grace and purity. To his followers, Bernini, Boromini, Fontana, and others, is to be attributed, in a great measure, the cause of the decadence which followed the architecture of the 16th century.—From Italy, the renaissance was first introduced into France. Among those who distinguished themselves in this kingdom, were Jean Bullant, Philibert de Lorme, and Pierre Lescot. Later appeared De Brosses, Du Cerceau; and, finally, Perrault, under Louis XIV., tried in vain to revivify a taste for the pure and simple elements of ancient architecture. England boasts likewise of her Inigo Jones—her Palladio, followed by Christopher Wren, Sir William Chambers, Sir Robert Taylor, and many others of merit and distinction.—**MODERN ARCHITECTURE.** The architectural elements of the 19th century would seem to be purely eclectic. It is but just, however, to make an exception in favor of the modern French school, the *Romantique*, wherein the Grecian rather than the Roman elements are introduced, and whose designs, portraying simplicity, grace, purity, and harmony, form a singular contrast with the old edifices of the French capital, on whose blackened mass is traced the incrustated atmosphere of ages. With the introduction of steam, new wants were created, vast depots and other structures were required, and iron came naturally into general

use, from its being a material easily wrought; and from its ductile qualities capable of covering an extended area, its use proving more economical than the materials formerly employed. Thus far, the most important structure upon which this material has been throughout employed, is the crystal palace of Sir Joseph Paxton. Iron is to-day, to a great extent, employed in shop-fronts, on account of its dispensing with the ponderous stone masses which were formerly used, and which excluded much light. We find it also applied in the construction of warehouses and in public buildings, it being fire-proof. In the United States it is much used in façades. The introduction of iron, as an architectural material, taken in connection with many special circumstances attendant upon the prosperity of the United States, must inevitably influence and promote art, and give it a natural and necessary tendency to compose, combine, and originate, new architectural features.

ARCHITRAVE, in architecture, the lowest of the 8 divisions of an entablature, resting immediately upon the column. It is named from the Greek word *αρχος*, chief, and Latin *trabs*, a beam, because, in wooden buildings, the architrave consisted of a beam fixed upon the capitals of the pillars. It was called in ancient architecture the epistyle. The use of the architrave is to bind the columns together. The ancient architraves were generally a single stone reaching from column to column, but in modern times they are seldom monolithic, but composed of several stones so adjusted as mutually to support each other. The form of the architrave varies in the different orders; in the Tuscan it has but one stripe, surmounted by a fillet; it has two faces in the Doric and Composite order, and three in the Ionic and Corinthian.

ARCHIVES, the records of a nation. Stone has proved a more faithful depositary than metals; yet stone has shown itself a much weaker guardian of such treasures than materials far more frail. In the palaces of Nineveh Mr. Layard has shown us that the alabaster slabs, which bore the records of one dynasty, were smoothed or reversed to receive the laws or the laudations of another. In some cases they placed their longest inscriptions on the backs of the slabs, and thus built them into the wall, hoping that they might in this way foil the destructive malice of their foes. Nor were they unsuccessful in their aim. Some inscriptions have thus been preserved to us, and the patient labors of Rawlinson and Hincks are gradually changing their darkness into light. The celebrated rock tablets of Behistun, or Bisutun, at whose trilingual inscriptions Sir Henry Rawlinson has been so long laboring, seem to have owed their preservation to their inaccessibility. A shrewd idea about the preservation of archives is attributed by tradition to Seth, who is said to have written the history of the antediluvian ages on tablets of clay, making 2

copies, one of which he burned and left the other unburned. As a proof of the durability of this material may be mentioned the great number of tablets of burnt clay recently (1848) discovered by Layard in the record chamber of Kouyunjik, more or less broken, it is true, but still legible, and constituting undoubtedly some of the most ancient archives in the world. The hieroglyphic records of Egypt owe their preservation to the solidity of the monuments on which they were inscribed, and to the fact that, mud hovels being a sufficient shelter for the inhabitants of the country, these structures were rarely or never drawn upon as quarries. Yet the most perfect of Egyptian records is the "Book of the Dead," preserved upon frail papyrus. The Greek tablets of metal seem all to have disappeared. The marbles of Halicarnassus were rescued after having been built into the walls of a fortress, and others have been preserved with difficulty after being mutilated. Here, too, the frail parchment or papyrus proved superior to monumental marble; and the same is true of the Romans, though occasionally, as in the case of the tablet of Claudius, preserved at Lyons, metals have proved lasting memorials. In America, with the exception of the Mexicans and Peruvians, the various Indian tribes have never got beyond rolls of bark and painted skins for their records. The Peruvian archives consisted of knotted strings of different colors called *quippus* (from *quippu*, a knot). The red strings referred to war, the yellow to corn, &c. When first used these knots signified numbers only, but they were afterward invested with a figurative meaning so as to convey ideas to posterity when aided by the cultivated memories of the *quippu-camayocs* (superintendents of knots); and it is said that there are still some Indians in the interior of Peru who are able, but not willing, to interpret these records of their ancestors. The picture-writing of the Mexicans, however, was superior to this contrivance; since it sufficed for the transmission of their laws, tribute-rolls, mythology, calendars, and rituals, as well as their political annals. In this case also frail materials have proved safe depositaries; for these archives were written on cotton cloth and prepared skins, but still more frequently upon a sort of paper manufactured by them from the leaves of the American aloe, and this is said to have been more soft and beautiful than parchment. Modern governments have wisely availed themselves of the security afforded by the press; some of them, as, for instance, the British and the French, have systematically distributed to foreign libraries copies of their most important records as the best means of preserving them.

ARCHIVOLT (Gr. *αρχος*, chief, and *Lat. volutus*, a contour), in architecture, the inner contour of an arch, or the ornamented band of mouldings round the arch-stones of an arch, terminating and resting upon the imposts. It is, like the architrave, variously adorned, according to the richness or simplicity of the order.

ARCHONS, certain magistrates of ancient Athens. According to the old tradition, Codrus, king of Athens, having, about 1068 B. C., sacrificed his life to save his country, the people, or rather the nobles of that city, determined that, as no one was worthy to succeed this hero, they would have no more kings, and accordingly intrusted the highest power to a magistrate, whom they styled archon (*αρχων*, a ruler), whose authority was somewhat more limited than that of the ancient kings. Medon, the son of Codrus, was the first archon, and the office was hereditary in his family until 714 B. C., when it was thrown open to all the Eupatridæ or patricians. Previous to the year 752 B. C., the archon held his office during life; at that time the duration of the term of that office was limited to 10 years; and in 688 B. C. to one, while, at this latter epoch, the office was divided among 9 persons, instead of being held by only one, as previously it had been, and several years afterward, though precisely at what time is not known, the archonship was made accessible to the citizens generally, who were subject, however, to some restrictions as to qualification. The power of the archons, at first almost supreme, became limited by degrees, and, at last, they had very little influence in the management of the government. One of the 9 archons was called the archon, as being the chief of the whole body, and his duty was to superintend the greater Dionysiac festivals, in honor of Bacchus, and the Thargelia, in honor of Apollo and Diana, and to exercise a general care over orphans, and jurisdiction in matters relating to the law of inheritance. He was sometimes styled eponymus (*επωνυμος*, one from whom something is named), because he gave the designation to the year, as did the consuls at Rome. The 2d archon was entitled king (*βασιλευς*), as he occupied the place of the ancient kings with regard to all public religious worship. He had personal jurisdiction in disputes concerning the rights and duties of priests, and was public prosecutor against all persons who were accused of having committed offences against religion, and against murderers. He had also a general superintendence of all matters relating to religion, and particular charge of the celebration of several festivals. The 3d archon was called polemarch (*πολεμαρχος*, commander-in-chief), and originally had supreme control over the army. The polemarch Callimachus was in command of the Athenian forces at the battle of Marathon, 490 B. C., but this is the latest known instance of the polemarch's having exercised such authority, his duties being, in aftertimes, confined to attending to the affairs of the alien residents of Athens, just as the archon eponymus had the care of those of the citizens, to the management of the funeral games in honor of such Athenians as had fallen in battle for their country, and the superintendence of other similar rites. Each of these three archons was allowed 2 assistants, whose appointment had to be sanctioned by

the senate. The rest of the archons were styled thesmothetæ (*θεσμοθεται*, lawgivers), though this name was also sometimes applied to the whole body. Their duties were mainly connected with the administration of the law, which they annually revised. They received charges against persons accused of any crime or misdemeanor, brought cases before the courts for trial, had the superintendence of voting in popular assemblies, and the ratification of treaties with foreign states, arranging the condition under which actions at law might be brought between citizens of such states and Athenians, gave notice of the days of sitting of the courts of law, appointed the dicasts or jurymen, took care that all new laws were properly entered, and formed a court of justice having jurisdiction in certain cases. These were their principal duties. In the times when democracy was powerfully developed at Athens, the archons, previously elected, were chosen by lot. The examination to which they were obliged to submit before they could enter upon their office was, however, a slight restriction on the indiscriminateness of such a choice. They were exempt from extraordinary burdens and taxes, and if any one insulted or struck one of them, while wearing his badge of office, which was a chaplet of myrtle, the offender was rendered infamous, and deprived of all civic rights. At the expiration of their year of office, they were obliged to submit to an examination as to the manner in which they had performed their duties, and, if such examination proved satisfactory, were admitted members of the court of the areopagus. The name archon was also sometimes applied to certain civil and religious officers in the eastern empire.

ARCHYTAS of Tarentum, an Italian Greek, contemporary with Plato, and famous as a philosopher, mathematician, general, and statesman, accidentally drowned while crossing the Adriatic. He is said to have been 7 times general of the Tarentine forces, and to have been victorious in every war which he conducted. He is also said to have been repeatedly intrusted by his fellow-citizens with the management of their political affairs, and to have evinced no less capacity in council than in action. He was on very intimate terms with Plato, with whom he kept up a regular correspondence. He was much addicted to mathematics, and was the first who applied mathematical principles to practical mechanics. He also constructed various machines and automata. As a metaphysician he is supposed to have furnished both Plato and Aristotle with many of their ideas and principles. Numerous fragments of the works ascribed to Archytas have come down to us, some of them genuine, some spurious. The best collection will be found in the *Opuscula Græcorum* of Orellius.

ARCIS-SUR-AUBE, a town of France, department of Aube; population, 2,652. It contains cotton and spinning manufactories, manufactories of cotton hosiery, and is an entrepot

for iron, and for the wooden wares made in the Vosges. Near this town, March 20, 1814, Napoleon defeated a division of the allied army.

AROSZIEFFSKI, CHRISTOPHER, governor-general of Brazil, born toward the end of the 16th century, died at Lissa, in Poland, in 1668. He was son of a Polish colonel, and left his native land on account of his religious opinions, to enter the military service of Holland, then at the height of her glory. He rapidly rose in rank, and upon the conquest of Brazil by the Dutch, was appointed its governor-general. He built extensive fortifications at Rio Janeiro, Bahia, and Pernambuco, and beside being a brave and skilful soldier, was a distinguished mathematician. The Dutch caused a medal to be struck, in commemoration of his services.

ARCO, a charming little Tyrolean town, not far from the lake of Garda, in the valley of the Sarca, with 2,000 inhabitants, who support themselves by the olive oil and silk trades. It is the residence of one of the historical families of Germany, represented at the present day by Count Leopold Arco, born in 1786. The genealogy of the family, whose domains came in 1614 under the sway of Austria, goes as far back as the 13th century, and several of the counts have occupied civil and military positions of eminence. The most distinguished member of this family was born in 1479, died in 1546; he was remarkable as a soldier and a Latin poet.

ARCOLE, a village of Austrian Italy, on the Alpone, 15 miles E. S. E. of Verona. It contains 1,600 inhabitants, and is famous for the victory gained there by Napoleon over the Austrians, Nov. 17, 1796.

ARÇON, JEAN CLAUDE ÉLÉONORE D', sur-named LE MICHAUD, a French engineer, who distinguished himself by the invention of floating batteries, born at Pontarlier in 1738, and died in 1800. He was intended for the pulpit, but having evinced a genius for drawing plans of fortifications, he was transferred to the military school of Mézières. He was present in 1780 at the siege of Gibraltar, where the idea of floating batteries suggested itself. The duc de Crillon planned an attack on Gibraltar, in accordance with Arçon's suggestions, but it was not successful. In 1798 he distinguished himself in the wars with Holland, but some false charges having been brought against him, he left the army, and devoted himself to literature. His most important work is entitled, *Considérations militaires et politiques sur les fortifications*, published in 1795 at the expense of the French government.

ARONA, or ARKONA, a promontory forming the north-eastern extremity of the island of Rügen, in the Baltic sea. It rises in steep cliffs out of the sea, but its surface is fertile. A temple to the god Swantewit, formerly venerated by the Slavonians of northern Germany, once stood here, together with an old Vandal castle. But in the year 1168, Waldemar I., king of Denmark, stormed the castle, and

burned the temple, and on the spot where they stood a light-house now rises.

ARCOS, RODRIGO PONCE DE LEON, duke of, viceroy of Naples during the insurrection headed by Masaniello, was born in Spain, in the latter part of the 16th century. After filling several responsible stations, in 1646 he was appointed viceroy of Naples. He found the people oppressed by many grievous taxes, imposed by the Spaniards to defray the cost of their wars with France, Portugal, and other nations, and instead of attempting to alleviate their condition, lost no opportunity of adding to their burdens. About this time the French sent several expeditions against the Spanish possessions in Italy, and Arcos seems to have eagerly availed himself of this pretext to add to the already enormous taxes exacted from the people. His edict announcing this, which appeared Jan. 8, 1647, was the signal for a popular outbreak, of a most violent and sanguinary nature, headed by Tommaso Aniello, a fisherman, better known as Masaniello. The people demanded the abolition of the tax on bread, and the restoration of the privileges of the emperor Charles V. Arcos, after a vain attempt to appease them, took refuge in flight, but was arrested, and compelled to take an oath to redress the public grievances. Having succeeded, shortly afterward, in gaining possession of the citadel, he refused to ratify his promises, whereupon the insurrection blazed forth with greater fury than ever, and was participated in by all classes of citizens. Finding resistance in vain, he again yielded to the demands of the people, but cunningly took advantage of the infatuation with which a sudden elevation to power had seized Masaniello, to work his destruction. He invited him and his wife to the royal palace, humored his arrogance, and even saluted the pair with the title of duke and duchess, and soon after procured his assassination, amidst the acclamations of the fickle populace. Public confidence in the viceroy, however, was not yet restored, but the opportune arrival of the fleet of Don John insured his safety, although the insurrection was not finally quelled for some months. Arcos retired from office Jan. 28, 1648, just a year after the commencement of the outbreak, and died in disgrace. (See ANIELLO.)

ARCOT, a city and district of British India, forming part of the Carnatic, and in the presidency of Madras. The city is on the river Palaur. The district was formerly the possession of an independent sovereign, but the nabob Auwar-ed-deen was killed in battle in 1749, with an opponent supported by the French. Subsequently it was taken from them by Lord Olive, who resisted the French in a siege. It was taken by Hyder Ali, and in 1801 the city and district were finally ceded to the British by the nabob, they making him an annual allowance, and undertaking to pay all his creditors, a matter of no little difficulty, owing to the con-

fusion of his affairs, and the immense amount of the claims, about \$35,000,000. The city was fortified, but the fortifications have been converted into gardens, and so much only of them retained as would serve for an embankment against the inundations of the river.

ARCTIO (Gr. *αρκτος*, bear), relating to the north pole, the two constellations of the Great and Little Bear being near the north pole of the heavens.—The **ARCTIC ORACLE** is a circle round the north pole of the earth, about lat. $67^{\circ} 30'$. Neglecting the refraction of light, an observer on the arctic circle would have his longest day in summer just 24 hours long, the sun hiding half his disc below the northern horizon at midnight of that day. His longest night in winter would be also 24 hours, the sun showing half his disc in the southern horizon at mid-day at the winter solstice. This line bounds the north frigid zone, although that zone may also be defined as of irregular shape, bounded by the isothermal line on which the average temperature of the year is at the freezing point.—**ARCTIC HIGHLANDS**. The tract thus designated forms the north-eastern angle of the American continent, from the mouth of the Mackenzie river to the shores of Hudson's bay. The surface of this vast tract is rugged and broken, and abounds in lakes and water-courses. The climate of the entire region is the most severe on the American continent. The mean temperature of the winter is from 55° to 60° below the freezing point. The mean temperature of summer is not above 4° or 5° F. The whole region is destitute of wood, and is almost a desert.—**ARCTIC SEA**, the ocean which washes the northern shores of America and Asia, and extends thence to the pole. Those portions nearest the American and Asiatic coasts are blocked up by never-melting ice, which makes navigation impossible. Between the American coast and lat. 80° , numerous little-known "lands" and islands dot this ocean. Between lat. 80° and the pole, it is now generally conceded, there lies a tract of nearly open water, known to geographers as the open Polar sea. The analogies of science (see Maury's "Physical Geography of the Sea"), as well as the discoveries of Kane, Inglesfield, and Belcher, all go to prove the existence of this open sea. In Kane's expedition, the view of this water was obtained from a precipitous headland, in lat. $81^{\circ} 23' N.$ and long. $65^{\circ} 85' W.$ Dr. Kane gives the following reasons for regarding the water here seen as an iceless open sea:

1. It was approached by a channel entirely free from ice, having a length of 53 and a mean width of 36 geographical miles.

2. The coast ice along the water line of this channel had been completely destroyed by thaw and water action, while an unbroken belt of solid ice 125 miles in diameter, extended to the south.

3. A gale from the north-east, of 54 hours' duration, brought a heavy sea from that quarter, without disclosing any drift or other ice.

4. Dark nimbus clouds and water sky invested the northern horizon.

5. Crowds of migratory birds were observed thronging its waters.

ARCTIC DISCOVERY. Until within a recent period it was believed that Columbus and Cabot were the actual first discoverers of the American continent. Careful researches on the part of northern antiquarians, however, would seem to prove, that portions of the American coast—some maintain as far south as what is now Long Island—were known to the seamen, the sea kings of Norway, as early as the 9th and 10th centuries. Newfoundland and Greenland were the regions best known to these rovers, from whose slight accounts it is supposed that the climate of those regions was much milder at that period than it is now. In the year 1000 a Norwegian, with a crew of Icelanders, landed on the coast of Massachusetts, which he named *Vinland*. This party erected monuments on an island in Baffin's bay, where they were discovered in 1824. They established colonies on the Greenland coast, which flourished for some years, making great gains by the fisheries, which they pursued as far as Lancaster sound, and even to Barrow's straits. Greenland and Spitzbergen were for several centuries prosperous colonies. Iceland, then at the height of its prosperity, found here a fair field for the enterprise of its inhabitants, who not only followed commerce and the fisheries, but propagated their faith in the new land, and built up numerous churches and convents, whose ruins are still found along the Greenland coasts. The Icelanders and Northmen, then, were the first arctic explorers. Theirs, however, was an exploration which had no object beyond the immediate profit of the adventurers. They left no records of their voyages beyond their pecuniary gains and the adventures they encountered, and seem to have been little aware of the importance of the great discovery they had made. As the Greenland and Spitzbergen colonies perished, and the most important Icelandic expedition was lost, and never heard from, while Iceland itself and the countries of the north were distracted by internal troubles, no trace of the discoveries made by these people was communicated to the rest of Europe. In 1380, two Venetian navigators, Zeni by name, voyaged to the north, and brought back tidings of what they had seen. Their discoveries, however, resulted in nothing important. In 1497 the Cabots, John and Sebastian, landed at Labrador, and afterward projected a voyage toward the north pole. They penetrated as far as $67^{\circ} 30' N.$, that is to say, about half way up Davis's straits. This may be called the first actual northern exploring voyage. Columbus set out upon his voyage with the object of discovering a shorter passage to the Indies. The Cabots seem to have been animated by the same desire. Finding a continent barring their progress directly westward, they at once stretched away north, thinking to sail westward, around its northern terminus, and thus reach the much desired Cathay. These, then, were the first seekers for the north-west passage. The next ex-

plorers were the brothers Cortereal, who made in all 8 voyages, penetrating as far as 60° N., but resulting in nothing but disaster to the adventurers and loss of life. This was in 1500, '1, '2, '3. In 1553 Sir Hugh Willoughby was sent out by the Muscovy company to find a N. E. passage to Cathay and India. He penetrated to Nova Zembla, was driven back by the ice as far as the mouth of the Arzina in Lapland, and here the gallant commander and his crew were afterward found frozen to death. In 1576-'78, James Frobisher made 3 voyages to the north-west. He discovered the entrance to Hudson's strait and Frobisher's strait leading into Hudson's bay. Beyond this no material result was achieved. These were the first voyages on which we hear of scientific investigations being made. In 1578 Sir Humphrey Gilbert, a relative of Sir Walter Raleigh, received authority to make a voyage of discovery on the American continent. He was a firm believer in the practicability of a north-west passage. A discourse of his upon the subject is yet extant. Of Sir Humphrey's marvellous adventures and chivalrous bearing on his voyage of exploration, as these were practically without result, we have not space to give details here. Next followed (1585-'88) Davis, who made more important accessions to a knowledge of the Polar sea than any of his predecessors. He first fairly discovered the strait which bears his name, and surveyed portions of the coast of Greenland. It may be well to say here that these and other navigators, Danes, French, and Dutch, were stimulated to energetic efforts for finding a northern passage to India, in great part because Spain, then in her glory and power, monopolized the traffic across the Atlantic and Indian oceans, and dealt summarily with all intruders. The Dutch persevered in their search for a north-east passage. William Barentz made 3 voyages in this direction, 1594-'96. He and his crew suffered much, struggled manfully against difficulties of which they could have had no conception when they set out on their voyages, and for which they were but inadequately prepared; but, so far as the prime object of their expedition was concerned, accomplished nothing material. Barentz himself perished on the 8d voyage, when his crew were in boats near the Icy cape, a headland of Russian America, in the Arctic ocean. We now come to Henry Hudson. He set out in 1607, under the auspices of the Muscovy company. His instructions develop a new trait and phase in arctic explorations. He was ordered to steer directly toward the north pole. He reached lat. 81° 30', steering due north along the coast of Spitzbergen, and returned convinced that a passage across in that direction was impossible of attainment. The following year (1608) he tried the north-east passage, which was then a favorite route with those who believed in the practicability of reaching the Indies by the north. He pushed forward as far as practicable for the ice (about lat. 75°), and returned

the same year. The next year he tried again, but, finding his way impeded by large masses of ice, he returned and sailed westward, and, searching along the American coast for a passage way, discovered the bay of New York and the river which yet bears his name. In 1610 Hudson set sail upon a 4th expedition. He sailed up the strait named after him, into the mouth of Hudson's bay, penetrating several hundred miles further than any one had ever gone before, to the west. The expedition wintered on one of the islands in the mouth of the bay. Their progress in the spring was beset with many difficulties. They met with storms, the provisions gave out, the crew mutinied; and, finally, a portion of the mutineers returned to England, but without Hudson, who perished by the way. It was now supposed that Hudson's bay was a great outlet into the Pacific waters, and sanguine expectations were entertained that here would be found the desiderated north-west passage. Within the next 5 years several expeditions were made into Hudson's bay; and two important channels, Fox channel and Sir Thomas Rowe's Welcome, were partially explored. In 1616 Baffin explored pretty thoroughly the bay called after him, even entering the mouth of Lancaster sound. Baffin's survey was very exact, and for upward of 50 years after his explorations, no navigator penetrated beyond him. Meantime, however, the Russians were actively exploring in another direction. By overland expeditions through Siberia, and by vessels through Behring's strait, they sought to establish the practicability of a passage to the north-east. It was on one of these expeditions that the extreme variation of the magnetic needle was first closely remarked. Notwithstanding the ill successes of divers expeditions, the Russian government persevered. In 1741 Behring set sail with an expedition from the harbor of St. Peter and St. Paul (Petropaulovski) in Kamtchatka. The crew suffered greatly on this expedition. After various buffetings before severe gales, having twice made the American coast and been driven off to sea, the commander (Behring) died; the vessels were wrecked; the crews wintered on an island known as Behring's island; built a small vessel the following spring; and finally reached Kamtchatka Aug. 25, the year after they sailed. We have space only to make bare mention of the expeditions in 1760 of Shaloroff, who perished of starvation with all his crew; of Andrejeff; and of Capt. Billings, who started from the mouth of the Kolyma in Siberia. None of these resulted in important additions to the stock of geographical knowledge; and so we come to the last of the Russian efforts—the sledge expeditions of Von Wrangell and Anjou, between the years 1820-'23. These explorers penetrated to lat. 70° 51' N. long. 157° 25' W., and reported an open sea in the distant north, which precluded further operations with sledges. The natives whom they met at various points, spoke of land still

further north. They did not see it, however. The Russian government seems now to have been unwillingly satisfied of the impracticability of a north-east passage, and the extreme difficulties attending explorations in the ocean to the north of Siberia; sledge navigation being interrupted by large tracts of open water, while naval explorations were rendered yet more impossible by the vast fields of ice which constantly guard the Siberian coasts.—We return now to the British navigators, between whom and the Americans the perils and honors of arctic exploration were henceforth to be divided. Hudson's bay was yet considered a great outlet toward the north-west, and in 1748 the British parliament offered a reward of £30,000 to the crew who should accomplish a passage north-west by way of Hudson's bay. Between 1769-'73 a Mr. Hearne made three overland journeys north toward the Polar sea. In the 8d he discovered and traced to its mouth the Coppermine river. In 1773 Capt. Phipps (Lord Mulgrave) was sent out with instructions to reach the north pole. From this time forth the arctic explorations were no longer merely for purposes of advancing commerce, but in great part for scientific objects, and with the purpose of elucidating various geographical and scientific problems, and satisfying an intelligent curiosity. Phipps, sailing along the shores of Spitzbergen, reached lat. $80^{\circ} 48'$ —not so far north as Hudson, who attained $81^{\circ} 30'$ in 1607. In 1778 Capt. Cook sailed on his last and fatal expedition, with instructions to attempt the Polar sea, by way of Behring's straits. He penetrated only to lat. $70^{\circ} 45'$. From his great experience and success as a navigator ardent expectations were entertained that he would accomplish what no one else had succeeded in. A vessel was despatched to Baffin's bay, there to await him. But in vain. The ice he found to form a solid barrier entirely across his path. Previous to Cook's expedition the conditions of the parliamentary reward had been extended so as to include any northern passage for ships, and an additional reward of £5,000 was offered to the crew that should penetrate to within 1° of the pole. In 1789, Mackenzie, in a land expedition, discovered and traced to its mouth the river called after him, without, however, achieving any other result. The next 2 expeditions set sail in 1818, one under the command of Capt. Ross and Lieut. Parry to discover the north-west passage; the other under Capt. Buchan and Lieut. (Sir John) Franklin, to penetrate to the north pole. Of the last-mentioned expedition the objects were, of course, entirely scientific. The commanders were instructed to pass northward between Spitzbergen and Greenland without stop, and to make every effort to reach the north pole. They found the temperature along the western shore of Spitzbergen unexpectedly mild. But they did not succeed in penetrating further than $84^{\circ} 34'$, and did not get clear of the ice which sur-

rounded them in this latitude without encountering great danger. One of the ships, the *Dorothea*, being much shattered by the ice, the expedition was finally abandoned, and the 2 vessels returned home without accomplishing any material result beyond making some interesting experiments on the elliptical figure of the earth, on the refraction of the air in high latitudes, and on magnetic phenomena.—With the other expedition it was proposed to explore the great openings reported by Baffin to exist at the western extreme of Baffin's bay, and to report fully upon the state of the coasts and waters visited, with the scientific phenomena witnessed. The expedition sailed April 18, 1818. They passed along the Greenland coast; met ice first off Waygat island; saw natives further along, who refused with horror their biscuit and sweetmeats, but drank train-oil; saw, for the first time, red snow; passed Wostenholm sound, looked into Smith's strait, steered south along the western shore past Smith's sound; and finally, Aug. 30, entered Lancaster sound. They were now arrived upon unexplored ground, and the crews first entertained the feelings of discoverers. It was not supposed that Lancaster sound was in point of fact more than a bay, and the vessels were steered into it with many misgivings. After sailing up some 60 miles it was thought that land was discovered, extending completely across from shore to shore of the supposed bay; and, the weather threatening a storm, the vessels were put about. After exploring the coast to the southward and eastward for some distance, the vessels returned to England, where they arrived in October (1818). Capt. Ross reported Lancaster sound to be a bay through which there was no practicable outlet to the ocean beyond. In this opinion several of his officers by no means agreed; and it appears that he failed to convince the scientific public of England of the correctness of his view. Lieut. Parry, who was as positive and sanguine that Lancaster inlet was a sound as was Ross that it was a bay, was intrusted with another expedition wherewith to establish, if possible, the fact. The *Hecla* was his own vessel. The *Griper*, under the command of Lieut. Liddon, was the consort. The expedition numbered 94 men, and was fitted out with provisions for 2 years. The vessels sailed May 11, 1819; first fell in with ice June 18, and found themselves firmly beleaguered on the 25th. They entered Lancaster sound July 30. But it was not till Aug. 8 that both vessels were able to lay their course fairly up the channel. Then they made a rapid run as far as the mouth of Barrow's straits, passing divers islands, bays, and headlands, naming them as they passed, and finally reached the mouth of Prince Regent's inlet. They had now advanced further than any mariners had ever gone before them. They were approaching the magnetic pole, and found their compasses of little use. They entertained the most sanguine hopes of achieving the great ob-

ject of this and other expeditions—a north-west passage. They pushed forward, meeting and overcoming, or avoiding various obstacles, until Sept. 4, when Parry announced to his delighted crew that, having passed the 110th parallel of longitude, they were entitled to the reward of £5,000 offered by parliament for this achievement. On Sept. 20 they were imbedded in ice, and further progress was stopped. They cut their way out and returned to Melville island, where they prepared to spend the winter. Here they made observations, collected specimens, noticed the different animals which constitute the limited *fauna* of that region, and, when the weather permitted, made excursions to different parts of the island, finding—particularly on the western shore—mosses, a dwarf willow, saxifrage, and some small grass in the spring. On June 1 of the following year it was yet very cold. By the 2d week in June the ground was to some extent thawed out, and travelling was rendered difficult. On Aug. 2 the mass of ice which had confined the ships in their harbor broke up and floated out, setting the explorers at liberty. By the 15th they were again imbedded in ice, having made but little advance. Finding their westward progress entirely barred, they finally put about for home, reaching Britain in safety, and with the crews in a healthy condition. So successful a voyage raised high the expectations of all interested, and it was determined to send Parry out again. He accordingly sailed, in command of the *Hecla* and *Fury*, in May, 1821, with instructions to make for Repulse bay, by way of Hudson's straits, with the expectation of thus avoiding much of the ice which had defeated the previous expedition. Before this, however, in September, 1819, an overland expedition was sent out from York Factory, on the western shore of Hudson's bay, with instructions to explore the northern coast of America, from the mouth of the Coppermine, eastward. This expedition consisted of Lieut. Sir John Franklin, Dr. Sir John Richardson, two midshipmen, Messrs. Hood and Back, and a seaman named Hepburn. In the event of Parry's making the coast, on his 1st expedition, the two expeditions were to co-operate. They reached Chipewyan on March 26, having accomplished a foot journey of 856 miles, with the weather so intensely cold that the mercury sank to the bulb of the thermometer and then froze. In July, 1820, they travelled 500 miles more to Fort Enterprise, where the party wintered, while Mr. (Sir George) Back, the midshipman, returned to Fort Chipewyan, to hurry along the supplies necessary for the next season's operations. Mr. Back, after innumerable hardships, returned to Fort Enterprise March 17, 1821, having travelled over 1,100 miles, sometimes two or three days without tasting food, with no covering at night but a blanket and deerskin, and with the thermometer ranging between 47° and 57° below zero. On June 30, 1821, the party, having dragged their

canoes and supplies from Fort Enterprise to the Coppermine, 80 miles, embarked on that stream and floated seaward. They reached the sea July 18, and immediately commenced paddling to the east. They sailed and paddled along shore 550 miles, and imagined themselves upon the point of emerging into the vast Arctic ocean, when, to their dismay, they discovered that they had just reached the bottom of a huge bay. With but 3 days' provisions remaining, they sadly turned back, Sept. 1, and, unable even to reach their starting point, built 2 small canoes of the larger ones, and ascended the river, a short distance west of Point Turnagain, the spot where they gave up further progress eastward. Short of food, in a country deserted even by the few animals which supply the scantyarder of the arctic voyager, ill provided with all that could facilitate their progress, eating the remains of their old shoes and whatever scraps of leather they had, obliged from exhaustion to abandon their canoes when they came to rapids, subsisting, at the last, upon rock tripe and the mosses which they could gather by the way, disappointed in finding assistance at a station where they had expected it, the sufferings of this party were almost unparalleled, and such as but few men could have endured. They lost 2 of the companions, and reached, in July, 1822, York Factory, whence they had started 3 years before. In these 3 years they had accomplished a journey of over 5,500 miles, without accomplishing that which they had set themselves to do, or proving aught but the Christian fortitude and perseverance sufficient to overcome even the greatest obstacles. Meantime, Captains Parry and Lyon, in the *Fury* and *Hecla*, made Southampton island, the terminus of Hudson's strait, early in August, 1821, and immediately steered to the north, up Fox channel. Passing a bay hitherto unknown which they named after the duke of York, they entered Repulse bay, in the hope of finding here an outlet toward the Arctic ocean. Leaving Repulse bay, they started upon the exploration of a hitherto entirely unknown region. They met with many difficulties, and made slow progress, finding it necessary to explore every indentation of the coast, in the hope of finding somewhere the hoped-for outlet toward the sea. Toward the close of September, the ice began to accumulate, and Parry was obliged to cut into a large floe, and make there a winter harbor for his vessels. The winter was devoted to various scientific experiments. The ships were visited on several occasions by Esquimaux, who, however, could give them no information concerning the country they lived in. It was July before they were once even free of ice, and able to make progress on their voyage. It was near the entrance of Lyon inlet where they wintered. They made their way to the north up Fox channel, slowly, against a current setting to the southward, and reached, August, the small island of Igloodik, situated at

entrance of a strait, which they were determined to pass through. This strait, called afterward the strait of the Fury and Hecla, was filled with ice. The ships were long detained, reached the middle of the strait only in September, and were obliged to return to Igloodlik, for the winter, Oct. 30. Another winter (1822-'23) was passed here. The next spring proved unfavorable. The expeditions by land were able to effect but little, on account of the extreme ruggedness of the shore. The first week in August was past before the ships were released from their icy harbor; and Parry, who saw all advance to the north barred, even then, by vast masses of ice, returned home, arriving in England in Oct. 1823. So far but little had been accomplished. But the government was not discouraged, and the explorers seem to have been ever hopeful, and ever ready for new trials and sufferings. Four expeditions were now fitted out. The 1st, consisting of 2 ships, under Parry, was to try Prince Regent's inlet, which it was supposed would be found to open at its southern extreme, into that great open Arctic sea, of which so much was hoped. The 2d party, under the command of Franklin, was to descend the Mackenzie river to the sea, and there divide, one party turning to the east, the other endeavoring to penetrate westward, even to Behring's straits. Captain Beechey, in the Blossom, was despatched around Cape Horn, to sail through Behring's straits and make headway to the east as far as Kotzebue sound, where he was to wait for Franklin's overland party. The 4th expedition (Capt. Lyon, in the Griper) was to pass to the south of Southampton island up Sir Thomas Rowe's Welcome, to Repulse bay; then to cross the Melville isthmus, and survey the coast as far as Franklin's Point Turnagain. This expedition was unfortunate; the vessel was twice nearly wrecked, and the expedition was abandoned when yet 80 miles distant from Repulse bay. Parry's expedition sailed in May, 1824, entered Lancaster sound in September, got into the ice, and was obliged to winter in Port Bowen, near the entrance of the sound. The following July, when starting forward again, the Fury was wrecked, and Parry returned to England in the Hecla, with a double crew. The only object gained by this disastrous expedition was a contrivance whereby the compass was made to work perfectly under all circumstances, and in all places, no matter how near the magnetic pole, thus obviating a most serious difficulty in arctic navigation. This was accomplished by simply placing a small circular plate of iron near the compass.—We come now to Franklin's expedition. The officers forming his staff were Dr. Richardson, Lieut. Back, Mr. Kendall, and Mr. T. Drummond, a naturalist. They arrived at Fort Chipewyan in July, 1825; passed on to Great Bear lake, where the party were to winter; and thence a small party with Franklin descended the Mackenzie to the sea, which they reached at a point in lat. 69°

14', long. 135° 57', 1,045 miles from Great Slave lake. Here, on an eminence overlooking the Arctic ocean, Franklin had the mournful privilege of unfurling to the cold breeze a banner presented to him by his wife for this purpose, as she lay on her death-bed but a few days before his departure. She died the day after he left England. On June 28, 1826, the whole party again started from their quarters, down the Mackenzie. The expedition separated, according to the previously planned course of operations. Franklin, going to the westward, reached the sea, and penetrated as far west as Return Reef, in lat. 70° 24', and long. 149° 37' W., whence, on Aug. 18, he set out on his return for the Mackenzie, the weather turning bad, and he being unaware that Beechey was waiting for him but 146 miles to the westward. The latter, in the Blossom, had passed through Behring's strait and anchored near Ohamiseo island, in Kotzebue sound, on July 22. He waited here till the season advancing made further stay dangerous; and then sailed for Petropaulovski. The following year (1827) he again anchored in Kotzebue sound, but of course did not meet Franklin's party as he had hoped. Franklin traced the coast for 374 miles from the mouth of the Mackenzie. His voyage extended over 2,000 miles. The other party (under Dr. Richardson) accomplished but little, sailing along an uninteresting shore. The whole expedition wintered at Great Bear lake, where Franklin instituted a series of observations on terrestrial magnetism. As his winter quarters lay on the opposite side of the magnetic pole from Parry's, who made similar observations, it follows, to quote the words of Franklin, that "for the same months, at the interval of only one year, Capt. Parry and myself were making hourly observations on 2 needles, the north ends of which pointed almost directly toward each other, though our actual distance did not exceed 855 geographical miles; and while the needle of Port Bowen was increasing its westerly direction, ours was increasing its easterly, and the contrary—the variation being west at Port Bowen, and east at Fort Franklin—a beautiful and satisfactory proof of the solar influence on the daily variation."—We now come again to an expedition whose object was to reach the north pole. In 1806 Mr. Scoresby, a whaleman and private discoverer, had penetrated as far as 81° 30' north, further than any one had gone before him. Buchan and Franklin so completely failed in the ship expedition in 1818, that Mr. Scoresby was led to advise an expedition to proceed by boats so fixed on sledges as to be easily dragged over the ice. Capt. Parry received the command of an expedition fitted out in accordance with this idea. Two boats, covered, well built, and set upon sledges, were to be landed upon the northern shores of Spitzbergen, whence they were to be dragged or sailed as ice or water presented itself. It was June 20, 1827, before Parry started with his boats, which con-

tained 71 days' provisions. They met with many difficulties from the outset—thin ice, rough ice, short tracts of water interspersed with shorter tracts of ice; and snow-blindness among the crews. The last evil they obviated by travelling altogether at night, completely reversing the usual order of living, and for many days sleeping regularly by day and pushing forward by night. So slow was their progress that in 5 days of unremitting exertions, from June 24 to 29, they made but 10 miles due north. Setting out with the hope of reaching the pole, they finally willingly compromised on the 88d degree. Even this they were not destined to reach. The ice on which they travelled moved to the south, in a body, about as fast as they could move northward, and, on reaching 82° 45', they gave up. They were then by observation distant from the Hecla 172 miles. To attain this distance they had actually passed over 292 miles of ice and water; and having to make several of their days' journeys over 8 or 4 times on account of the moving ice, it was calculated that they really travelled 668 miles. They got back from this most discouraging and laborious expedition Aug. 21, thus signally failing in the only attempt ever made to reach the pole by going direct over the icy barrier which guards it, a project which bore upon its face more likelihood of success than any other ever devised for the same object.—We come next to an expedition fitted out by Sir Felix Booth, and commanded by Capt. Ross and his nephew, Commander (Sir James) Ross, in the *Victory*, a vessel fitted to use steam in calm weather. The object was to find a north-west passage by some opening leading out of Prince Regent's inlet. The *Victory* sailed in May, 1839; entered Prince Regent's inlet Aug. 9; made the scene of the *Fury's* wreck on the 12th; and, on the 15th, reached the furthest point achieved by Parry, whose explorations it was intended to follow up. They now met with many difficulties from the ice. Amid these, during the months of August and September, they worked their way along 300 miles of hitherto undiscovered coast, and finally reached a point only about 200 miles distant from the extreme point reached by Franklin on his last expedition from the westward. As the shore here suddenly trended to the westward, the voyagers now entertained strong hopes that the intervening 200 miles would be navigable at some future time. The season, however, was now over, and Oct. 7 they got into winter quarters at a place they named Felix harbor. Sept. 17, 1830, they once more got under way. After making 8 miles, they again entered winter quarters, where they remained till Aug. 23, 1831. After making 4 miles (which consumed a month's time) they again, Sept. 27, got into winter quarters. It was during April, 1831, that Capt. Ross, on a sledging expedition, for the first time reached and fixed the position of the true magnetic pole. The spot was in lat. 70° 5' 17", and long. 96° 46' 45" W. The scurvy

appearing among the crew, it was finally deemed best to abandon the ship, and with the boats on sledges to make for the place of the *Fury's* former wreck. After almost incredible hardships and sufferings, they reached this spot July 1, 1832, having left their ship April 23. Here, on *Fury* beach, they were obliged to pass another winter—1832-33. The crews suffered much. Several died, and many others were sick. They started again for the open sea July 8, 1833, and Aug. 26 descried a vessel, which took them on board. The captain refused at first to believe that Captain Ross and his crew stood before him. They had been given up for dead, for 2 years past. On Sept. 30, 1833, they reached the Orkneys, having been absent since May, 1829. In Feb. 1833, Back, with Dr. King, a naturalist and surgeon, left England for an overland expedition in search of Ross's party. They reached Fort Resolution, on the Great Bear lake, August 8. They passed on to Muskox lake, to the north and east, but returned to winter at Fort Reliance, where they suffered terribly from scarcity of food, and a temperature which brought the thermometer to 102° below the freezing point. Back says, "On one occasion, while washing my face *within three feet of the fire*, my hair was actually clotted with ice before I had time to dry it." On April 26, when they were preparing to start for the sea-coast to the north and east, they received news of the safety of Ross and his party. On June 28 they launched their boats on the Thlew-ee-choh river, which, they hoped, would take them to the Polar sea. After a most difficult navigation of 530 miles, they finally, July 29, reached the ocean, at lat. 67° 11' N. and long. 94° 30' W., about 37 miles south of the mouth of the Coppermine. Its whole course ran through a country without a single tree—"an iron-ribbed country," Back calls it, "desolate, but abounding in game." They now pushed on along shore, but met with constant impediments, and were finally, Aug. 14, obliged to turn back. The extreme point they reached was in lat. 68° 18' N. and long. 94° 58' W. The entire line of coast was level, and devoid of vegetation. They arrived at Fort Reliance Sept. 17, having been nearly 4 months away, and having travelled over a large tract of country before unexplored; but without having accomplished any thing of importance toward the elucidation of the great problem of the possibility of a north-west passage. Back returned to England in Sept. 1835, and in June, 1836, set out in the *Terror*, to complete the exploration of the supposed water connection between Ross's winter harbor, in Prince Regent's inlet, and the Point Turnagain, which Ross had so vainly attempted to reach. They were unfortunate from the first, and accomplished nothing. Simultaneously with this expedition, the Hudson Bay company sent out 2 men, Dease and Simpson, to descend the Mackenzie river to the sea, and follow the coast to

the west, as far as the point from which Beechey turned back to go out of Behring's strait. This would complete the survey of all that part of the American shores. They reached Return Reef, Franklin's furthest point (Aug. 1826), in July, 1837. Beyond this no one had ever been. They reached Point Barrow, the extreme point attained by Beechey in 1826, August 4, and thus completed their task. They discovered on the way two large rivers, which they called the Garry and the Colville. Returning to winter quarters on Great Bear lake, they started on another expedition, to explore to the eastward, in June, 1838. They reached the coast by way of the Coppermine. Finding their progress stopped by the ice, a portion of the party set out to the eastward, on an overland expedition. Passing Franklin's Point Turnagain, the furthest point hitherto reached from the west, they discovered an ice-encumbered strait (Dease's strait), and at its eastern extremity a large headland. To the north lay an extensive tract of land, now first seen, and which they called Victoria land. Surmounting the ice-bound cape, the explorers, to their surprise, found the sea beyond entirely free of ice; Victoria land stretching for 40 miles to the E. N. E., and the American coast trending to the S. E. This was the limit of their explorations in 1838. In an expedition the following year, they sailed through Dease's strait, and not only settled the coast line, up to the spot which Back had reached in 1834, but went beyond, and ascertained that the estuary of Back, into which they sailed, separates Boothia on the west from the American continent. In fact, they joined their discoveries very nearly to those of Ross, and were at one time within 90 miles of the place he fixed upon as the locality, during that year, of the magnetic pole. The entire American coast, along the Polar sea, was now explored, except that portion lying between Dease and Simpson's extreme point on the west of Boothia, and Ross's winter quarters on the east side of the same land; and that tract lying between Ross's winter quarters and the extreme point reached by Parry in 1822, at the entrance of the strait of the Fury and Hecla. The main question now was on the possibility of passing with ships between Boothia and the American mainland, as, if this were possible, the passage down Prince Regent's channel would be the easiest one, for the accomplishment of a passage to the north-west. To settle this question, an all-important one in its bearings upon future explorations, the Hudson Bay company, in 1846, sent out Dr. John Rae. He and his party reached Chesterfield inlet July 18, 1846, passed Repulse bay safely, and conveyed their boats thence into the gulf of Akolee. Wintering, however, at Repulse bay, the result asked for, from their expedition, was not attained till 1847. On April 5 of that year they started again into the gulf of Akolee. On the 18th they reached an inlet which Sir John

Ross had before discovered, in one of his land excursions, during his 2 winters' sojourn on the coast of Boothia, and (Ross having established the continuity of the coast to that point) thus proved that Boothia is connected with the American mainland, and that, consequently, there is no outlet toward the west, through Prince Regent's inlet, and thus was destroyed the most plausible of all the suggested passages to the north-west—that which bade fair to be most generally open and practicable. Returning to recruit, May 12, Dr. Rae set out to explore the eastern shore of the gulf of Akolee, and connect his surveys, if possible, with those of Parry (1822) in the Fury and Hecla strait. On May 27, the party reached a point from which, during an interlude in the storm, they saw a headland, which Rae calls Cape Ellioa, and computes to be in lat. $69^{\circ} 42' N.$ and long. $85^{\circ} 8' W.$, that is to say, within 10 miles of the Fury and Hecla strait. This completes the entire survey, with the exception of Fury and Hecla strait itself, and thus was finished, with this exception, a geographical exploration of the northern coast of the entire American continent, on May 27, 1847. —We come now to the last voyage of Sir John Franklin. The discovery of a north-west passage was no longer a dream of the merchants. As a road to the Indies, this passage had been for some time given up, but the world of science anxiously demanded further and more complete explorations, mainly to establish the disputed separation of the American continent from the land to the north. There were enough men found, brave, hardy, and adventurous, to meet the wishes of the men of science. The achievement of a north-west passage was a life-dream of Franklin, and to him was intrusted the new, and—so it was hoped—final expedition. The *Erebus* and the *Terror*, long tried in arctic navigation, were the vessels chosen for the voyage. Each was fitted with a small steam engine, and screw propeller to work in calms and head winds, and narrow ice gorges. Sir John Franklin commanded the *Erebus*, Captain Richard Crozier the *Terror*. The crews amounted to 128 men. The vessels sailed May 19, 1845, in company with a tender, with additional stores. This tender was relieved and sent home, in Davis's straits, where the vessels were fully provisioned and equipped for a 3 years' stay. On July 6, 1845, they were seen by a whaleship, in lat. $74^{\circ} 48'$, and long. $66^{\circ} 18'$, about the centre of Baffin's bay, moored to an iceberg, and waiting an opening into Lancaster sound. This is the last time the vessels were ever seen, and from this time arctic explorations were conducted with a main view to relieving Franklin's expedition, or discovering its remains. Franklin's expedition was very completely equipped in all respects, and no pains nor expense were spared to provide against any and all conceivable accidents in the regions of ceaseless ice. The instructions of the admiralty directed Franklin,

after sending home the transport from Davis's straits, to make the best of his way to Baffin's bay, and through this into Lancaster sound. Lancaster sound, Barrow's strait, and the passage to Melville island the admiralty thought likely to be clear of ice, and Franklin was therefore instructed to "push westward, without loss of time, in about lat. $74^{\circ} 15'$, till you have reached the longitude of that portion of land on which Cape Walker is situated (North Somerset), or about 98° W. From that point we desire that every effort be used to endeavor to penetrate to the southward and westward in a course as direct toward Behring's straits, as the position and extent of the ice, or the existence of land, at present unknown, may admit." Beyond this, Franklin was given authority to act as unforeseen emergencies should dictate. He sailed, as before said, in May, 1845. Toward the close of 1847, nothing having been heard of the expedition, alarm began to be felt as to its safety, and early the following year (1848), 8 different expeditions for succor were despatched by the British government. The first of these, in the *Plover*, Commander Thos. Moore, and the *Herald*, Capt. Kellett, was to enter Behring's strait, and advance at least as far as Chamisso island, in Kotzebue sound, and then to examine the coast further to the eastward in boats. The expedition was joined by the *Nancy Dawson*, a pleasure yacht, owned and commanded by Mr. Robert Shadden, who took a very active part in all the operations. The vessels reached Chamisso island July 14, 1849, proceeded immediately on to Icy point, and thence sent the boat expedition on to explore, if possible, as far as the Mackenzie river. The vessels meantime stood to the north, until, in lat. $72^{\circ} 51'$ and long. $163^{\circ} 48'$, they were brought to by densely packed ice. Still exploring, on Aug. 17 they discovered land, some islands, and a greater body of land, in about lat. $71^{\circ} 80'$, and long. 175° W. On Aug. 24, part of the boat expedition rejoined the vessels, the remainder, 2 whale boats, having been despatched, according to previous instructions, up the Mackenzie river, to proceed homeward by way of Fort Hope and York Factory. The returned boats had explored the shore as far as Dease's inlet, but had found no traces of the lost voyagers. The following summer (1850), the 2 vessels reexplored the same ground, but again without meeting with any traces of Franklin. The *Plover*, Capt. Kellett, was left to winter in Grantley harbor, and the *Herald* returned home. Meantime, part of the land party, under Sir John Richardson, reached the Polar sea, Aug. 4, 1847, making deposits of pemmican by the way, at convenient points, along Mackenzie river. They then explored the shore to the east for 800 miles, to the mouth of the Coppermine. They found no traces of Sir John Franklin. The next summer, 1849, Sir John Richardson having returned to England, Dr. Rae explored the shores of Wollaston sound, and in 1850 he repeated his explora-

tions, but with like non-success. The 8d expedition, that under command of Sir James Ross, sailed from England May 12, 1848, explored the south side of Lancaster sound, as far as Cape York, and thence across the mouth of Prince Regent's inlet, wintered at Leopold harbor, and the following spring (1849) explored the shores of North Somerset as far as lat. $72^{\circ} 38'$ and long. $95^{\circ} 40'$ W., discovering what was not certainly known before, that North Somerset and Boothia were united by a narrow isthmus. They explored, also, portions of the shore north of Barrow's straits, and both sides of Prince Regent's inlet, establishing the partly consolatory fact that Franklin's party had not been lingering anywhere within their reach the past winter. The expedition returned to Britain Nov. 8, 1849, without having fallen upon any traces of Franklin. The non-success of all these expeditions caused immediate and renewed efforts to be made. The general opinion of those best acquainted with arctic navigation, and with Sir John Franklin, was that his party was ice-bound among the islands to the westward of Melville island. Thither, therefore, were the next efforts mainly to be directed. In March, 1849, the British government gave notice that £20,000 would be awarded to any private exploring party, of any country, which should render efficient aid to the missing explorers. In 1849 Lady Franklin had a supply of coals and provisions landed upon Cape Hay, south side of Lancaster sound. In 1850 8 new expeditions were sent out by the British government, with instructions mainly identical with those of 1848. The year 1850 was, however, to see many more expeditions than these 8 of the government. In fact, there were in all no less than 8. We will mention them all, with the portion of the general object intended to be accomplished by each. First on the list comes the continuation of Dr. Rae's expedition of 1849. He was to penetrate further to the north than he had been able to do before; and to examine the shores of Bank's island, the coast about Cape Walker, and the north side of Victoria land. Two smaller parties were at the same time to follow the mainland to the westward, toward Point Barrow, one descending the Mackenzie, the other the Colville.—Next comes the Behring's strait expedition, consisting of the *Enterprise*, Capt. Collinson, and the *Investigator*, Commander McClure. They were instructed to cruise in company as far to the eastward as they could get; to make friends of the Esquimaux; to make occasional deposits of provisions; and to prevent, by every means, any detention of the vessels in the ice. The *Investigator* and *Plover* (the last already in the Pacific) were last in getting through Behring's strait. The commanders of these two vessels having provisions sufficient to last till 1854 (from 1850), determined to push on resolutely, and explore as far as they possibly could; and here we must leave them.—Next comes the government Baffin's bay expedition, consisting

of the *Resolute*, Capt. Austin, and the *Assistance*, Capt. Ommaney—sailing vessels—and the *Pioneer* and *Intrepid*, Capt. Sherrard Osborne, both screw propeller steamers. The instructions to this expedition were mainly of a similar tenor to those given the Behring's strait commanders. This fleet sailed in the spring of 1850. The schooner *Felix*, and a small tender, the *Mary*, formed an expedition put forward by public subscription, and commanded by Sir John Ross. He sailed in April, 1850, provisioned for 18 months, and designing to commence at Cape Hotham, at the west side of the entrance of Wellington channel, and examine all the headlands to Bank's land. Finding nothing, he then intended to leave his tender and push forward for a second season in the *Felix*. The *Lady Franklin*, fitted out by Lady Franklin, and commanded by Capt. Penny, with the brig *Sophia*, sailed also in 1850, intending to explore as circumstances should seem to direct, but having a general plan somewhat similar to the government expedition.—Lady Franklin also fitted out and defrayed two-thirds of the expense of another expedition, consisting of the schooner *Prince Albert*, commanded by Commander Charles Forsyth and Mr. W. P. Snow, both volunteers. Their object was to examine the shores of Prince Regent's inlet and the gulf of Boothia, and to send out overland travelling parties to explore the western side of Boothia, down to Dease and Simpson's strait. The *Albert* sailed in June, 1850.—The *Advance* and *Rescue*, under the command of Lieut. De Haven, formed an American expedition, fitted out by the United States government, but at the cost chiefly of Henry Grinnell, Esq., of New York. This expedition left New York May 24, 1850. Its plan was to push forward, without delay, toward Bank's land and Melville island, and generally to make the best use of every opportunity for exploring in that direction.—Lastly comes the *North Star*, a transport ship, containing stores for the expedition of Sir James Ross. She wintered at the head of Wostenholm sound, in lat. $76^{\circ} 38'$, the furthest north any vessel ever wintered except Dr. Kane's, and returned to England in Sept. 1850.—It will be seen that there were now no less than 11 vessels, exclusive of the *North Star*, on the eastern arctic waters. Capt. Ommaney of the *Assistance*, came upon the first traces of the missing mariners, at Cape Riley, Aug. 23, 1850. A more minute examination of the country immediately surrounding gave indisputable proof that Franklin's party had sojourned about there for some time. The site of a tent, paved with small stones; quantities of birds' bones lying around; as also meat canisters, were the traces discovered at Cape Riley. At Beechey island, about 8 miles west of the cape, and just at the entrance of Wellington channel, Lieut. Osborne finally came upon the encampment of the party—in fact the first winter quarters of Sir John Franklin. The objects here discovered were a large number of empty

preserved meat tins, the embankment of a house, with carpenters and armorers' working places, and other remains of a large establishment; and finally, the graves of 8 men belonging to the *Erebus* and *Terror*, which bore date of the winter of 1845-'6. Further on, on the island, there were the remains of a garden, and various articles of apparel lying about. Lieut. De Haven, of the American expedition, visited the place on Aug. 25, and made another thorough search. The officers of the *Prince Albert*, as well as Capt. Penny, also examined the entire ground very minutely. Singularly, not all this searching brought to light any document which could give the slightest trace of the future intentions of the party. Taking for granted the fact that there was nothing of the kind left, it is only to be supposed that they had so far met with no extraordinary perils, and departed from the island in a very sanguine frame of mind, little thinking of the terrible fate which was but just coming upon them. The belief of those having the greatest experience and the best judgment, is, that the lost party were detained at Beechey island till late in the season (1846), and that, on account of some sudden movement in the blockading ice, they departed suddenly. The government ships wintered but little distance from each other; and the spring of 1851 was devoted to land expeditions, in which the shores of Wellington channel, the coast of Bank's land, and the waters leading from Barrow's strait to Melville island, were to be thoroughly explored. The various parties made a thorough search on their different routes, discovered 675 miles of hitherto unknown coast, but found no trace of the lost. Lieut. McClintock's party reached on this occasion the furthest western limit ever attained by arctic explorers, starting from Baffin's bay, a point in long. $114^{\circ} 20' W.$ and lat. $74^{\circ} 38'$. From the wondrous tameness of animals found hereabouts it would seem that few if any human beings had ever touched this point before.—The conclusion deduced from the failure of all efforts in these directions to obtain traces of Sir John Franklin, was that he had not gone to the southward and westward of Wellington strait, as had been hitherto taken for granted. A discovery by Capt. Penny of a hitherto unknown channel, opening northward from Wellington channel, corroborated the above conclusion; although neither here were traces found of the party. The newly discovered strait was called Victoria channel.—Dr. Kane's opinion, on examining the sledge tracts about Cape Riley, was that Sir John Franklin had passed to the north, with his ships, on the breaking up of the ice in 1846; had gone through Wellington channel into the supposed Great Polar basin, and had never returned.—The American expedition, which had gallantly led the way, wherever they could go, and whose commander earned for himself at the hands of the English the sobriquet of "the mad Yankee," after undergoing much suffering and considerable danger, arrived in New

York, the *Advance* on Sept. 80, and the *Rescue* on Oct. 3, 1851. On June 8, 1851, the *Prince Albert*, which had brought to England news of the discovery at Beechey island, was dispatched by Lady Franklin on another expedition to explore the shores of Prince Regent's inlet. She returned in Oct. 1853. The only incident bearing even remotely upon the search, was that at a point between Fury beach and Cape Walker, a land party came upon a cairn and a depot of provisions left by a party under Capt. Austin. The ground being deeply covered with snow, Capt. Kennedy actually took the cairn to be part of the cliff upon which it stood; and walked over the provision depot without noticing its presence—a circumstance which would seem to point to the supposition that Franklin's signals and traces might have been passed over in the same way. The final and firm conclusion drawn from the final non-success of all the expeditions, including Dr. Rae's, of 1851, which was very thorough, was, that Franklin had never reached so far south as the American mainland, or the peninsulas connected with it. Sir John Ross had brought back a report that the Franklin party had been murdered in Wostenholm sound, by the Esquimaux. To establish the truth or falsity of this rumor, Lady Franklin sent the *Isabel* screw steamer, Commander Inglefield, to explore this sound. He left England in July, 1852, examined Wostenholm sound—finding no traces of the missing ones—sailed up Smith's sound to lat. $78^{\circ} 28' 21''$ —140 miles further than previous navigators had reached—found, as he thought, a more genial climate than existed to the south, and established, in this voyage, the presence of a strait or channel connecting Baffin's bay with the great Polar basin. Meantime, in obedience to the Wellington channel theory, Sir Edward Belcher was sent out in April, 1852, in command of 5 vessels, the *Assistance*, *Resolute*, *North Star*, *Pioneer*, and *Intrepid*—the last 2, steamers. The *North Star* was to be the depot and store-ship, the *Resolute* and *Intrepid* were to steer west, to the assistance of Collinson and McClure. The *Assistance* and *Pioneer* were to push up Wellington channel. In the spring of 1853, more expeditions were sent out. The chief of these was that fitted out by Mr. Grinnell of New York, Mr. Peabody of London, and others, and commanded by Dr. E. K. Kane, who had acted as surgeon, naturalist, and historian of the former Grinnell expedition, under De Haven. Lady Franklin sent out the *Rattlesnake*, and *Isabel*, steamer, for Behring's strait, to assist Collinson and McClure. Dr. Rae was despatched for another exploration of Boothia. And, finally, the *Lady Franklin* and *Phoenix*, Capt. Inglefield, were sent to Barrow's straits, to aid Sir Edward Belcher. With Inglefield on this expedition was Belot, a gallant young Frenchman, who was lost Aug. 18, 1853, by being blown off some floating ice.—The westward expedition of Belcher made a number of explorations in the general direction of their line of search, toward Mel-

ville island. They found no traces of Franklin; but fortunately succeeded in finding and rescuing McClure and his ship's company, who had been buried in the arctic ice since the summer of 1850—3 long years. These returned home with Belcher, abandoning their ship; and are thus the first and only ship's company who ever entered Behring's strait and returned to Europe by Baffin's bay. Thus was established, at last, the great fact that there was a continuous passage by water from Baffin's bay to Behring's strait, parallel with the coast of the American continent. McClure reached, in his ship in 1850, within 60 miles of the western terminus of Barrow's strait, and thus had nearly passed through with his vessel. The crews under Belcher's command had meantime made extensive explorations by land during the spring and autumn of 1853, and the spring of 1854. The *Assistance* and *Pioneer* penetrated up Wellington channel to lat. $78^{\circ} 10'$, making various discoveries of new land and islands. When the vessels were brought to by ice, the officers set out on sledges, and penetrated overland to a point which Belcher considered an opening into Jones' channel, from the east. Here, to their surprise, as early as May 20, all sledging operations were stopped by open water. They found at various points structures of ice, too well built to be the work of natives; but nowhere the slightest tangible trace of Sir John Franklin. In the spring of 1854, the vessels composing the expedition, the *Assistance*, *Resolute*, *Pioneer*, *Intrepid*, and McClure's ship, the *Investigator*, were abandoned, their crews taken on board the *North Star*, *Phoenix*, and *Talbot*, and the entire party arrived in England in Sept. 1854. It must be mentioned here, that McClure, in Aug. 1850, discovered in the ear of an Esquimaux chief, near the mouth of Mackenzie river, a flat brass button. On being asked where he obtained this, the chief made answer that it had been taken from the ear of a white man who had been killed by one of his tribe. The white man belonged to a party which had landed at Point Warren (near the mouth of the Mackenzie), and there built a house. Nobody knew how they came, as they had no boat. But they went inland. The man killed had strayed from the party, and he (the chief) and his son had buried him on a hill at a little distance. When, or the exact spot where this occurred, could not be ascertained. Neither the grave nor the house was found. Collinson, McClure's companion on the Behring's strait expedition, eventually returned to England by the way he came. He made numerous discoveries of land, and explorations, in the neighborhood of Bank's land, Wollaston land, Albert land, and Victoria land; at Cambridge bay in Wollaston sound, in about lat. 70° and long. 117° , when his vessel passed the winter of 1852-'3, he saw in the possession of the Esquimaux a piece of iron and fragments of a hatchframe or doorway. These he thought must have belonged to Franklin's ships. But he was unable to obtain any intelli-

gences in regard to the manner in which the Esquimaux came into possession of them. This was the only trace of Franklin with which he met. There remained now only Dr. Rae's expedition to Boothia, and Dr. Kane's American expedition to hear from. Dr. Rae reached Pelly bay, at the southern termination or bottom of Prince Regent's inlet, in April, 1854. Here he met Esquimaux who had in their possession various articles of silverware, &c., belonging to various officers of both the *Erebus* and *Terror*. The intelligence obtained by him of the natives may be summed up as follows: In the spring of 1850, some Esquimaux killing seals near the north shore of a large island known as King William's land (some distance westward of Pelly bay), saw a party of about 40 white men pass to the southward, along the western shore of this island. They were dragging a boat and sledges with them. They could not speak Esquimaux, but the natives gathered that their ships had been crushed, and they were now going where they could find deer to shoot. They purchased a little provision from the natives, who judged that they were nearly destitute of food. The officer with them was described as a tall, stout, middle-aged man. At a later date, the same season, but previous to the disruption of the ice, the corpses of some 80 persons, and some graves, were discovered on the continent, and 5 dead bodies on an island near it, about a long day's journey north-west of the mouth of a large river supposed to be Back's river. Of the bodies on the island, one was supposed to be a chief, as he had a telescope slung about his neck. These men, from all appearances, had been driven to cannibalism before they perished. From the fact that shots were heard, and the feathers of wild fowl were found near the bodies, it is conjectured that a few of the men survived till May, 1851. They seem to have had an abundance of ammunition. There were, also, numbers of telescopes, guns, watches, &c., pieces of which articles were found among the natives by Dr. Rae, in considerable quantities. Dr. Rae's opinion was that the party died by starvation, and not by the hands of the natives. Mr. Jas. Anderson was sent out in 1855, to explore more perfectly the spot designated as the scene of so much suffering. On June 30, a little way from the mouth of Back river, he came upon some Esquimaux, who had with them numerous articles belonging to a boat equipage. The natives stated that the owners of these articles had died of starvation. On reaching Montreal island, where the 5 men had perished, according to report, Mr. Anderson found chain-hooks, tools, rope, bunting, and a number of sticks strung together, on one of which was carved the name of Mr. Stanley, surgeon of the *Erebus*. On a plank was found the word "Terror." Not a vestige of the remains, nor any paper, was found. At Point Ogle some small articles were also found, but no bodies. The party were unable to reach King William's land, the scene of the chief disaster.—With the

account of Dr. Kane's explorations at the head of Smith's strait, closes the history of arctic exploration and adventure. Dr. Kane sailed in the *Advance* from New York, May 30, 1853. The discoveries of Inglefield in Smith's strait, and those of Belcher at the head of Wellington channel, had produced in his mind the conviction that there was somewhere between the 80th degree of north latitude and the north pole, a vast open sea, and a milder climate than was found some degrees to the south; and further, that in this sea were to be sought, and he hoped found, tidings of Sir John Franklin's long absent expedition. His determination was, therefore, to penetrate as far up Smith's strait as possible, in the hope of being able to enter the Polar sea, and there have clear water, for his explorations. He entered the ice Aug. 2, and on the 20th found shelter from a hurricane under lee of a rocky island, which he named Godsend ledge. Leaving his men, on the subsidence of the gale, to tow the vessel along the ice, Dr. Kane, Aug. 29, passed ahead, with a boating party, to explore the coast. He thus passed numerous points of land, and reached Cape George Russell, whence he saw the great glacier of Humboldt, with Cape Jackson on one side, Cape Barrow on the other, and a sea of solid ice between. Not finding, on this trip, a good place for winter quarters, he returned, and the *Advance* was moored for the winter in Van Rensselaer harbor, in lat. 78° 37' and long. 70° 40'. During the continuance of daylight in the autumn, excursions were made into the interior of Greenland, in which over 800 miles were traversed, and the coast was traced for 125 miles to the north and east. During this winter the thermometer fell to 99 degrees below zero. Their winter harbor is further north than that of any other expedition whatever, and nowhere else but at Spitzbergen are Christians known to have passed a winter so near the pole. With March they were again cheered by the sun. But the crew were much enfeebled by the long winter. It was not till April that Kane started on his chief sledging tour to the north, in which he hoped to "attain the *ultima thule* of the Greenland shore, measure the waste that lay between it and the unknown west, and seek round the furthest circle of the ice for an outlet to the mysterious channels beyond." Owing to the severity of the climate and great obstacles, the expedition failed in its main object. But they discovered on this trip some remarkable natural features: the Three Brother Turrets, Tennyson's Monument, and the Great Glacier of Humboldt. They returned to the vessels May 14. Dr. Hayes and William Godfrey started on another expedition May 20. They crossed Smith's strait, and attained to lat. 79° 45' and long. 69° 12'. They saw, 80 miles ahead, 2 capes which they named Capes Joseph Leidy and John Fraser. On June 30, Messrs. McGary and Bonsall left on a 3d expedition, Kane being yet ill. They reached Humboldt's glacier on the 15th. Four of the party returned

on the 24th, entirely blind. Two pushed on, and on June 21 saw open water to the north, called by them Kennedy channel. They penetrated as far as Cape Constitution, in Washington land, lat. $82^{\circ} 27'$. The open channel abounded with animal life, such as bears, birds, and seals. The results of this excursion prove that Smith's strait in fact opens into Kennedy channel, and this opens into a great open polar sea, abounding with life. The shores of Kennedy channel and Smith's strait had been explored for 760 miles. Mr. Morton returned to the ship on July 10. Dr. Kane, seeing no probability of the release of his vessels during this summer, determined to communicate with Belcher's expedition. Failing in this, it was determined that part of the crew should abandon the vessel. The party, however, returned after a few days, and the crew were now beset for another winter. During this winter it was resolved to abandon the brig in early spring, and make for the Danish settlements at the south. On May 17 they left in boats and sledges, and after much privation and many narrow escapes, reached Upernavik Aug. 9, in 84 days from the time of leaving the Advance. Fears for Kane's safety had induced the United States navy department to send out, in the spring of 1855, 2 vessels, the Release and the steamer Arctic, to the relief of the missing brig's crew. Capt. Hartstene, who commanded this expedition, reached lat. $78^{\circ} 32'$ and then found his onward progress stopped by a firm barrier of ice. Returning, he found Kane and his crew at Upernavik, and returned with them to the United States, in the fall of 1855. In a scientific point of view, Dr. Kane's expedition attained the most important results of any arctic expedition whatever. These results cannot be more concisely or clearly summed up than is done by himself in his report to the navy department of the United States, as follows:

1. The survey and delineation of the north coast of Greenland to its termination by a great glacier.
2. The survey of this glacial mass, and its extension northward into the new land named Washington.
3. The discovery of a large channel to the north-west, free from ice, and leading into an open and expanding area, equally free. The whole embraces an iceless area of 4,200 miles.
4. The discovery and delineation of a large tract of land, forming the extension northward of the American continent.
5. The completed survey of the American coast to the south and west, as far as Cape Sabine; thus connecting our survey with the last determined position of Captain Inglefield, and completing the circuit of the straits and bay heretofore known at their southernmost opening as Smith's sound.

The Resolute, one of Sir E. Belcher's expedition, was, as before mentioned, abandoned May 15, 1854, not far from Beechey island. On Sept. 15, 1855, she was discovered by Captain Budington, of the George Henry, whaleship, of New London, off the west shore of Baffin's bay, in lat. $67^{\circ} N$. The vessel was encumbered with ice, but was perfectly tight and seaworthy. The distance between the place where she was abandoned, and that where she was retaken, was at least 1,200 miles. She was brought to New London, purchased by the U. S. govern-

ment by order of congress, thoroughly refitted, and presented to Queen Victoria and the British government, in December, 1856. The British government took possession of her, and had her stripped and laid up in ordinary in Woolwich dockyard.

AROTURUS, formerly a constellation near the Great Bear, whence its name, *apokrosvpos*, the bear's guard (or *ovpa*, tail). Later the name was confined to the largest star in the constellation, which was afterward called Bootea. It is a star of the first magnitude, and was at one time erroneously believed to be the star nearest to our system.

AROUATION (Lat. *arcus*, a bow), a term used to designate a method of propagating trees. The shoots sprouting from the stools or stems of the trees cut off near the ground, are bent over, and a portion of them is covered with earth; the shoots take root, and thus the tree is propagated. The term is, however, now obsolete.

ARQUEIL, a small village of France, $8\frac{1}{2}$ miles S. from Paris, on the Bièvre. It is celebrated for an aqueduct constructed there by the Roman emperor Julian during his abode in Paris, to convey water from the Bièvre to his palace. Remains of this are still seen near the modern aqueduct, constructed by Maria de' Medici, in 1618, to bring water to supply the gardens and the palace of the Luxembourg and the fountains of Paris. Arcueil is a favorite resort of the Parisians on holidays. It was for a long time the residence of the chemist Berthollet. As he frequently met at his house many of his learned friends who were devoted only to the study of the physical sciences, they formed together, in this tranquil retreat, a scientific society which, under the name of *Société d'Arcueil*, published several volumes of memoirs. The population of the village is 1,816.

AROY, GROTTES D', the name of a vast stalactitic cavern, consisting of many compartments, situated in the department of Yonne, in France, within a short distance from the little town of Vermanton. The hill in which this remarkable excavation exists stretches into the valley of the river Cure. A narrow path over a wooded hill conducts to its entrance. One of the compartments is 1,200 feet long, 85 feet high, and 40 feet wide. In the first 2 compartments are found large blocks of stone, and in the 3d compartment is also a spring of good water. In the other compartments a number of stalactites hang from the roof, while stalagmites rise, column-like, from the ground. The crystallizations are formed by the water, as it filters through the overhanging rock, as well as on that part of the ground on which it drops. As the crystallizations rising from below are thus exactly under those depending from the roof, they frequently unite and form pillars. The caverns are supposed to have been quarries in former times, but to have been abandoned so long that every trace of human labor is obliterated. It is said that the stone

with which the cathedral of Auxerre was built was taken from the *Grotte d'Aroy*.

AROY, PATRIOT D', a distinguished engineer, born at Galway, in Ireland, in 1735, died at Paris in 1779. His parents, in consequence of their attachment to the house of Stuart, left Ireland and settled in France. In 1746 he fought in the French army against England. He fell into the hands of the British commander, Admiral Knowles, but was released after a short time of imprisonment and returned to Paris, where he devoted himself to scientific investigation. He wrote some able essays on mechanical science, and in 1749 he was received a member of the French Academy. In 1757 he reentered the army, and took an active part in the battle of Rossbach. In 1760 he published an essay on artillery, containing, among other interesting subjects, an account of experiments made by him to determine the most advantageous length of cannon. He is also the author of a paper on hydraulic machines, and of a paper on the duration of the impression of light on the retina.

ARDEA, a small village of the Pontifical states, in Italy, 20 miles S. of Rome, and 8 miles from the Mediterranean. It is the capital of the ancient Rutuli, and near it are some Cyclopean remains.

ARDEBIL, or **ARDEBYL**, one of the principal towns of the province of Azerbaijan, in Persia, is situated on a branch of the Araxes, 40 miles west of the Caspian sea. It contains about 600 families, and is surrounded by a ruined mud wall. It is an emporium of the caravan trade of Tiflis, Derbend, and Bakoo with Ispahan and Teheran. Two of the ancestors of the Sufite kings of Persia are buried here, and their tombs are highly venerated by all Mohammedans.

ARDECHE, a department in the south-east of France, wholly of a mountainous character. It contains important blast-furnaces for iron, and is noted for its extensive tracts of chestnut trees, the annual produce of which is estimated at 400,000 bushels. It also abounds in mulberry trees and vineyards. Pop. 386,000.—**ARDECHER**, a river of France which rises in the mountains of Cevennes, and, after a course of 45 miles, falls into the Rhone, near Pont St. Esprit. In the earlier part of its course it threads the most magnificent scenery, and before it reaches the Rhone falls over an almost perpendicular precipice to a depth of 100 feet. At this point is the famous bridge of Arc.

ARDELAN, a district of Persia in Koordestan, and a part of the province of Irak Ajmee. The chief towns are Sinna and Kermanshah.

ARDEN, a forest in which Shakespeare places the scene of his "As You Like it." According to Walter Savage Landor, it began near Stratford-upon-Avon and extended to Red-ditch and the Ridgeway, the boundary of Warwickshire and Worcestershire, having for its

centre the little town Henley, called to this day Henley-in-Arden.

ARDEN, EDWARD, a British Catholic, born at Parkhall, Warwickshire, England, in 1581, executed at Smithfield in 1584. He was of an ancient and respectable family, and, although a staunch religionist, by his integrity and loyalty had succeeded in preserving his possessions entire, and in holding his faith unmolested until the unfortunate occurrence which caused his death. In 1583 his son-in-law, John Somerville, a Catholic gentleman of fortune, while on a visit at his house, was persuaded by one Hugh Hall, a priest connected with Arden's household, to attempt the life of Queen Elizabeth, as the only means of delivering the realm from Protestant sway. Somerville actually departed on this mission, and while on his way to London attacked several Protestants, which led to his arrest and that of Hall, on a charge of high treason. The latter being put to the torture made a statement which led to the arrest of Arden and his whole family. Arden and Somerville were tried, found guilty of treason, and executed, while the others were pardoned. Arden's fate excited universal commiseration at the time, and the severity of his sentence was ascribed to the influence of the earl of Leicester, between whom and the Arden family a hereditary feud existed. Arden, himself a man of high spirit, had once called the earl an "upstart," and the offence seems never to have been forgiven.

ARDEN, RICHARD PEPPER, Lord Alvanley, chief justice of the court of common pleas of England, born at Bredbury in 1745, died in 1804. He was called to the bar in 1769, and soon after became intimately associated with William Pitt. In 1776 he was appointed a justice in the South Wales circuit, and in 1780 king's counsel. Upon the formation of a new cabinet at the death of the marquis of Rockingham, he received the appointment of solicitor-general and entered parliament. Upon Pitt's accession to office he became successively solicitor-general, attorney-general, master of the rolls, and in 1801, on the resignation of Lord Eldon, chief justice of the court of common pleas, on which occasion also he was created a peer, under the title of Baron Alvanley. He lived but 3 years, however, to enjoy his new honor.

ARDENNES, or **ARDENNE**, a hilly district of Luxembourg, Belgium. It is wild, wooded, and thinly inhabited. It has manufactories of fire-arms and hardware. Cattle, sheep, and horses are raised in great numbers, but little grain.—Also a frontier department of France, contiguous to Ardennes in Belgium, with which it was formerly united. It has a mountainous wooded surface, and a chilly and humid climate. It is watered by the Meuse and Aisne rivers, connected by the canal of Ardennes, which furnish valuable means of inland transportation. It has manufactures of fire-arms and metallic wares, earthenware,

glass, and chemicals. Area 1,955 square miles, which is divided into the arrondissements of Mézières, Rethel, Rocroy, Sedan, and Vouziers. Capital Mézières; pop. 382,000.

ARDESCHIR, or **ARTAXERXES BABEGAN**, founder of the Persian dynasty of the Sassanides, died about A. D. 260. His father, an obscure shepherd, claimed descent from the royal line of Darius, who was conquered by Alexander the Great, and the son, remarkable in his youth for courage and force of character, by ingratiating himself with the governor of Dirabjeid, gradually gained an importance which brought upon him and his patron the enmity of Ardovan, the king of Persia. Ardeschir then boldly announced his intention to recover the throne of his ancestors and to exterminate the descendants of its usurper. He gave battle to Ardovan, whom he vanquished, and put to death, and caused himself to be proclaimed *Shahan Shah*, "king of kings." Profiting by this victory, he rapidly recovered the provinces constituting the old Persian empire, and even extended its limits. The first 80 years of his reign were devoted to wars and conquests, and his victorious arms were carried from Georgia on the north to the banks of the Indus. His victories, however, do not constitute his sole claim to renown. During the years of profound repose which marked the latter part of his reign, he cultivated the arts of peace with an enlightened zeal. As a jurist and legislator he showed remarkable capacity, and many of his maxims are preserved to the present day.

ARDGLASS, a seaport town and parish of Ireland, county of Down, on the Irish sea. It is a bathing place, and is the rendezvous for the vessels engaged in the fisheries on this line of the Irish coast.

ARDOOH, a village of Scotland, county of Perth, near which are some remains of a Roman camp, the most complete in Great Britain.

ARDRAH, or **AZEM**, a town of Africa, capital of a province of the same name, kingdom of Dahomey, about 20 miles from the sea-coast, and bordering on a small lake; pop. 10,000.

ARE, the unit of surface in the French system of measures, equivalent to a square decametre, or 1076.44 English square feet. Parts of an are are expressed by Latin prefixes, deciare, centiare, &c., signifying one-tenth, one-hundredth, &c., of an are. Multiples of an are have Greek prefixes; decare, hectare, &c., signifying ten, one hundred, &c., ares.

AREA, in geometry, the number expressing the size of a surface as compared with a unit of surface. A square of given size is usually taken as the unit, and usually a square whose side is a linear unit, such as an inch, a yard, or a mile. In this case, the area of a rectangle is evidently the product of the length by the breadth, and the area of a triangle half the product of the base by the altitude. The area of all other surfaces whatever is found by dividing the surfaces into triangles or rectangles. When the surface is curved or has curved boundaries, these

triangles or rectangles must be conceived of as infinitely small, and their amount can usually be calculated only by the aid of integral calculus.

AREMBERG, the name of an old German noble family, derived from a town and castle situated between Cologne and Julich. The counts of Mark possessed AreMBERG until the 16th century, when it passed to John Brabant, of the house of Ligne, and was erected, in 1576, into a German dukedom, which disappeared on the dissolution of the German empire by Napoleon, though the family retained the ducal title. The AreMBERGs were always adherents of the Catholic church, sided with Philip II. and afterward served the house of Austria, in both civil and military capacities. They now reside at Brussels, and are among the wealthiest nobles of Belgium and Germany. As the owners of extensive estates in Hanover and Prussia, they belong to the privileged nobility, *Standesherrn*, in both those kingdoms.

ARENA, **BARTOLOMEO**, a French politician, born at Isola Rossa, Corsica, toward 1765, died at Leghorn in 1829. He early became known by the fervor of his political opinions and his devotion to France. He was active in organizing the national guard in his native island. As a deputy to the legislative assembly of France, he was among the most patriotic members, and denounced the designs of his countryman Paoli long before they were publicly developed. His accusations became so vehement and appeared so well grounded that Paoli was summoned to the bar of the national convention, to which he replied by inviting the English to Corsica. Meanwhile Arena was declared infamous by the so-called national assembly of the island, and sentenced to banishment. Nevertheless, in concert with Casabianca, he sustained Calvi against the English, who were under the command of Nelson; but finally was obliged to surrender the town Aug. 10, 1794. He then repaired to France, where he bitterly complained of the apathy of the convention at the loss of Corsica. On the evacuation by the English, he returned to the island; and in 1798, after a severe contest and bloody riots, he was chosen member of the council of Five Hundred by the electors of Golo. He showed himself always an unflinching republican, and none of the deputies exhibited more energy in opposition to the military revolution of the 18th Brumaire. It was reported at that time and currently believed, that Arena had rushed at Bonaparte with a dagger and exclaimed that if Corsica had produced a Caesar, it should also have a Brutus. He publicly denied the attempt at assassination, though persisting in his abhorrence of the usurper's act. He was sentenced to be transported with several of his colleagues, but escaped the search of the police and retired to Italy, where he lived secluded at Leghorn. He constantly upheld his republican opinions, and always

prophesied the establishment of a European democratic commonwealth.—GIUSEPPE, a younger brother of Bartolommeo, particularly known for his participation in a conspiracy against Bonaparte when first consul. He very early evinced his devotion to the principles of the French revolution. In 1798, however, when only 21 years old, he was appointed commander of a battalion of Corsican volunteers, and distinguished himself at the siege of Toulon. In 1796, elected to the council of Five Hundred, he served one year as a deputy, and then returned to the army; but resigned his post on the revolution of the 18th Brumaire, in order to avoid serving under Bonaparte. He then repaired to Paris, where he engaged in a conspiracy devised by certain ardent republicans, Céracchi and Topirio-Lebrun among the number. Bonaparte was to be assassinated at the opera; the signal was to be given by a young man named Diana, when the others were to be in readiness to support him; but their plan had been revealed to the police, who were on the alert and noiselessly arrested the conspirators during the second act of the performance. Arraigned before the criminal court, they defended themselves with such ingenuity, and there was so little material evidence against them, that they would probably have been acquitted but for another and quite different attempt against the first consul: the explosion of the infernal machine Dec. 24, which was at first charged to the republican party, while it was the work of royalists. The criminal court, as well as the government, thought it necessary to discourage further conspiracies by inflexible severity; consequently the proceedings were hurried. Arena, Topirio-Lebrun, Céracchi, and Demerville, were sentenced to death Jan. 9, 1801, and executed on the 30th. They submitted to their fate with heroic constancy.

ARENAC, an eastern county of Michigan, bordering on Saginaw bay. Its surface is mostly heavily wooded. It covers an area of about 544 square miles. It is unorganized.

ARENDAL, a seaport town of Norway, on the Skager-Rack, lat. 58° 23' N. long. 8° 32' E. It is built on rocks projecting into a most commodious harbor. It possesses nearly 200 ships chiefly engaged in the lumber trade, and has 3 yards for ship building, a custom house, and a commercial school. Near it are productive iron mines.

ARENDT, MARDIN FRIEDRICH, a Danish savant, born at Altona in 1769, died near Venice in 1824. He was distinguished by his scientific exploration of many European countries, and his investigation of the ancient Celtic languages, mythology, and history. After having prepared himself for his travels by careful botanical and philological studies, he was sent by the Danish government in 1798 on a botanical tour into Finmark; but, as he was not successful in making a botanical collection, he lost the office, which, upon the recommendation of Count Re-

ventlow, he had previously held in the botanical gardens of Copenhagen. He had made, however, many interesting archæological observations, and explored districts of northern Norway, which had never been visited before. Subsequently he travelled in Sweden, France, Switzerland, Hungary, Italy, and Spain. He published many articles on history and philology in French, German, Swedish, and Danish periodicals, and a portion of his manuscripts and drawings in reference to Scandinavian archæology are preserved in the royal library of Copenhagen. He was a devoted linguist, and on his travels was always in the habit of carrying about him a great number of lexicons. While at Naples one of his Runic dictionaries attracted the notice of some Neapolitan police officers, who looked upon it with the greatest suspicion, taking it for a Carbonari document. He was arrested, and the long time which he had to pass in a badly ventilated prison before his discharge could be effected, had an injurious effect upon his health, and accelerated his death, which took place shortly afterward.

ARENSBURG, a seaport town of Russia, government of Livonia, on the south coast of the island of Oesel, of which it is the capital. It is situated at the mouth of the gulf of Riga, and has a considerable trade, though, owing to the shallowness of the harbor, all but small vessels generally anchor in the roads, 5 miles from the town.

ARENSHARDE, a district of Denmark, in the duchy of Schleswig. It is noted for the old Danish wall which runs through it, built in the 9th century, to defend Denmark from the incursions of the Saxons and Slavi. The wall extended completely across the country, and was 46 miles long. The people of this district are said to have been the first in Denmark to embrace Christianity, and a church was built there in the year 826.

AREOMETER, an instrument for determining the specific gravity of liquids, and by this the strength of spirituous liquors. Its more common name is hydrometer. The principle upon which it is constructed is this: when a bulb of glass or metal is immersed in water it is buoyed up by a force equivalent to the weight of an equal bulk of water, and in any other liquid by a pressure equal to the weight of the same bulk of this liquid. When the different weights are known of this bulb in water and any other liquid, the weights of equal bulks of these fluids are known, and the proportions of weight of one to the other. The areometer is a hollow bulb of glass or metal, with a weight below it to partially sink it, and keep the graduated stem above it in a vertical position. On this stem is marked the point at which the surface of the fluid cuts this stem, when it is immersed in pure water. In a saline solution it would not sink so deep, and the mark upon the stem at the surface is made to designate the density of the fluid compared with water, by reference to the tables which

accompany the instrument. In a lighter fluid, as spirituous liquors, it would sink below the pure-water mark, and the stem indicates, by its graduation, the proportional less density of the fluid than water. Sykes's hydrometer is the form adopted by the British government, and Baume's, of which there are two kinds, one for liquids heavier and another for liquids lighter than water, are in common use in France, and also in this country. A simple form of areometer is a set of glass beads, numbered and adjusted. When these are put in any liquid, the one of the same specific gravity with this liquid will float just beneath the surface. The mark upon this indicates, in thousandth parts, the specific gravity of the liquid.

AREOPAGUS, the hill of Area, or Mars, a craggy eminence in the city of Athens, not far from the Acropolis. In Greek annals it is famous as the spot where the celebrated council, or court of the Areopagus, held its sittings. This body was distinguished, even beyond the limits of Greece, by its great antiquity and high character, an antiquity dating back beyond the age of Solon, a character resting on the lofty position and spotless fame of its members. Solon is supposed to have introduced changes into the constitution of the Areopagus, and to have extended its functions, so that from being a merely criminal tribunal, its jurisdiction reached the general morals of society, and the political affairs of the state, touched every thing, in fact, which concerned the public weal. The court had duties connected with education and religion, had authority to punish impiety and sacrilege, and was charged with the preservation of the sacred groves. Its power was affected by the changing fortunes of the Athenian state. Pericles is said to have deprived it of a portion of its prerogatives, and later, its members were made responsible to the people. Its fame was alive in the time of Cicero, and as late as the emperor Theodosius (A. D. 380). In the records of Christendom, the Hill of Mars is memorable as the spot where the apostle Paul commenced the delivery of a discourse, the outline of which is preserved in the book of the Acts. There is no intimation that St. Paul was brought before the council of the Areopagus.

AREQUIPA, a province or intendency of South Peru, 48 miles long, and 86 broad. It has the province of Lima on the north, Bolivia on the east, the province of Arica on the south, and the Pacific on the west. Its principal streams are the Arequipa, the Tambo, and the Chilli. It has a healthy climate and a fertile soil, yielding wheat, maize, potatoes, sugar, cotton, flax, cochineal, coffee, strawberries, and other products of the temperate zone. Considerable quantities of wine are also made here, and exported to the adjacent provinces. Pop. about 120,000.—**AREQUIPA**, capital of the above province, is situated in the valley of Quilca, about 40 miles from the Pacific coast, and a little more than 7,800 feet above the sea-level, lat.

16° 20' S. long. 71° 30' W. The river Chilli, called also Rio del Volcan, flows through it. The Andes lie to the east, and 14 miles to the N. E. towers the Volcan de Arequipa, one of the most celebrated volcanoes of the Andes, 20,800 feet in height, and constantly active. The city has a fine climate, and is well built, bearing the reputation of being one of the finest towns of South America. Its plaza or public square, has an elegant bronze fountain. There are in the city a cathedral, and several churches, a hospital, a college, 3 nunneries, and 6 convents. The houses are usually of only one story, and with strong walls and vaulted roofs, on account of the earthquakes, which are very frequent here. At 4 different times the city has been laid in ruins by them, in 1582, 1600, 1604, and 1725. There are considerable manufactories of gold and silver cloths, and of cotton and woollen stuffs here. It has a considerable trade with Buenos Ayres, its exports being brandy, wine, flour, cotton, and sugar, and its imports, cattle, dried flesh, tallow, cocoa, &c. It is also the entrepot of American and European goods, which it receives through its port, Mollendo. The great commercial road from Lima to the southern provinces passes through the city. Pop. about 86,000.—**THE VOLCANO OF AREQUIPA**, after Ootopari, the most celebrated of all the South American volcanoes, is situated in lat. 16° 24' S. and long. 71° 10' W. It has an altitude of 20,800 feet, and 500 feet of its summit lies within the region of perpetual snow. It is 14 miles distant from the city of Arequipa. Its crater is deep, and ashes and vapor constantly issue from it.

ARES, the Greek god of war, corresponding to the Mars of Roman mythology, born, according to Homer and Hesiod, of Zeus and Hera. He seems, in the former of these poets, to represent rather the wild fury of the fight, while Pallas Athena embodies the wary watchfulness of the skilful combatant. Diomedes, though a mortal warrior, wounds him, and drives him from the battle, and in the conflict of the gods, Pallas falls him with a stone. When wounded he roared as loud as 9,000 or 10,000 men. When he fell he covered 7 acres of ground. Eris (Strife), his sister, bore to him 2 sons, Deimos (Terror), and Phobos (Fear). Aphrodite bore to him Harmonia. The temples and images of Area were not numerous. He is represented as a warrior, of a severe, menacing air, dressed in the heroic style, with a cuirass on, and a round Argive shield on his arm.

ARESON, JOHANN, a bishop and poet of Iceland, born in 1484, died in 1550. His trials commenced early in life, as his father's death compelled him, while a boy, to work for his mother's support. At 20 years of age he took orders, and in a mission to Norway showed so much talent that on the death of the bishop of Reikiavik, to which diocese he was attached, he was elected to fill his place. His election raised a storm of ridicule and opposition from disappointed competitors. He was accused of

not knowing Latin, and of appropriating to himself the diocesan property, and Ogmond, bishop of the neighboring diocese of Skalholt, even asserted his own right to appoint the new bishop, and marched at the head of a body of armed men to maintain it. Areson absented himself for a while, but upon his return boldly refuted the calumnies of his enemies, and was reinstated in his bishopric. His troubles, however, did not end here. The reformation broke out, and Frederic III. of Denmark, who, with many of his subjects, had embraced Lutheranism, wished to extend it over Iceland also. Areson, however, who had remained devotedly attached to the old faith, pertinaciously resisted every attempt on the part of the king, and with the assistance of his 6 sons, by his mistress Helga, constantly thwarted him. Frederic finally lost all patience and summoned Areson to Copenhagen, to which the latter replied by an armed invasion of the Protestant diocese of Skalholt, the bishop of which he took prisoner and treated with much harshness. He was outlawed, and forces having been despatched to bring him to terms, he was defeated, and with his 2 eldest sons, captured and executed. His devotion to the Catholic faith never wavered, and he had even proposed to the emperor Charles V., and to Edward VI. of England, to surrender Iceland to them, provided it should remain a Catholic province. His proposal to the latter shows a singular ignorance of the change which had been effected in the national religion of England. Areson was a man of much intelligence, and one of the truest poets of his time, as his literary remains amply testify. He is distinguished for having introduced printing into Iceland.

ARETÆUS, a physician who flourished in Cappadocia, a district of Asia Minor, in the latter part of the 1st and at the beginning of the 2d century after Christ. His contemporaries rank him next to Hippocrates. He wrote 2 works in connection with the causes, symptoms, and treatment of acute and chronic diseases, which are still extant. The best edition is that by Wigan, Oxford, 1728.

ARETHUSA, a fountain in Sicily near the city of Syracuse. The ancients supposed its waters to be united with those of the river Alpheus in Peloponnesus. A cup, it was said, thrown into the waters of this river, would reappear in the Sicilian fountain. Arethusa, according to the ancient legend, as related by Pausanias, was a Nereid, with whom the hunter Alpheus became enamored; but the nymph, not responding to his ardent love, fled to the island of Ortygia near Syracuse, and there changed herself into a fountain. Nothing daunted, Alpheus metamorphosed himself into a river, and in this form made his way under the sea to Ortygia. According to another account, Arethusa, while bathing in the river Alpheus, was surprised by the river-god, and Diana, in order to enable the nymph to escape his pursuit, changed her into a fountain, which

passed under the sea to Sicily.—Another Arethusa was one of the Hesperides, the guardians of the golden apples, to obtain which was one of the 12 labors of Hercules.

ARETIN, ADAM, baron von, a Bavarian statesman, born at Ingolstadt, in 1769, died in 1822, was in 1817 the deputy of Bavaria at the Frankfort diet, and acquitted himself of his mission in a manner satisfactory to his government. He was a munificent patron of the fine arts, and possessed one of the largest collections of engravings and pictures in Munich, which, after his death, was sold by auction.—CHRISTOPH, baron von, brother of the preceding, born also at Ingolstadt, in 1773, died at Munich in 1834. He held various public offices, and at the time of his death, that of chief justice of a court of appeal. He was for some time deputy at the Bavarian diet, where he advocated with great vigor his ideas, which were rather too cosmopolitan for the narrow sphere of Bavarian politics. His last work was, *Das Staatsrecht der constitutionellen Monarchie*. He left it unfinished, but after his death it was completed by Rotteck, and brought out at Leipsic in 1839.—GROSA, baron von, brother of the preceding, born at Ingolstadt, in 1771, died at Munich in 1843, was connected with the court and the inspection of rivers and lands of Bavaria, from 1793 to 1809, when he was appointed governor of the district of Brixen. While exerting himself to quell the insurrection which had broken out in the Tyrol, he was taken prisoner by the Austrians and confined in a fortress in Hungary. He was set free in 1810, but on his return to Bavaria, retired from public life, devoting himself to agricultural and literary pursuits.

ARETINO, a celebrated Italian writer, whose real name was Leonardo Bruni, born in 1369, at Arezzo in Tuscany, whence he is commonly called Aretino. Taken by the French and imprisoned with his father in the castle of Quarata, he often gazed at a portrait of Petrarch which happened to be suspended there, and which kindled in him a love of letters. He studied hard at Florence and won distinction under her most famous men, giving 2 years entirely up to Greek under Emmanuel Chrysoloras. In 1405 he won by public trial the post of apostolic secretary to Pope Innocent VII. and held it under Gregory XII., Alexander V., and John XXIII. In 1410, the republic of Florence named him chancellor. This post he held but a few months, returning again to the service of Pope John XXIII., in spite of his having been married in 1412. When this pope was deposed by the council of Constance he returned to Florence (1415) and wrote, among other works, his history of Florence. The grateful republic gave him citizenship and a pension. He was again made chancellor and continued such until his death. He died suddenly at Florence, March 9, 1444. His funeral oration was solemnly pronounced in the church of Santa Croce, and the orator Giannozzo Ma-

netti by order of the republic crowned him with laurel. His history of Florence was placed upon his breast, and the sculptor Bernardino Rossellino, was charged to raise to him a marble tomb which still exists.

ARETINO, GUIDO, often called Guy Aretin, or d'Arezzo, from his native town in Tuscany, was a Benedictine monk, born near the end of the 10th century. Endowed with inventive genius, he early occupied himself in devising new methods of writing and teaching music. The ancient principles of the art had been so much altered before his time, that it was necessary they should either be reestablished or replaced by others. This latter task Guido undertook. Instead of a group of tetrachords like the Greek method, or of heptachords, such as Gregory adopted, he proposed a new system, consisting of hexachords. The six syllables by which he designated his notes, were suggested to him, it is said, by a Latin hymn to St. John :

UT quant laxis EF sonare fibris
Mra gestorum FAMuli tuorum
SOLve pollinis LABili restum

To the seventh note, *si*, he gave no name, and for a long time it continued to be called *b*. Guido's new method of solmization attracted much attention at Hamburg, Osnaburg, and even in France. Such was its merit, that whereas ten years had been required to learn how to read music, now a chant could be mastered in a few days, and a year sufficed to make a skilful singer. Pope John XIX. (or XX.), wishing to form his own judgment of this marvel, sent three messengers in 1022, inviting Guido to his court. The monk went, presented a collection of the offices for a year, marked according to his method, and the pope, we are told, tested the method, by learning a verse perfectly before rising from his chair. Guido not only facilitated the reading of music, but simplified the manner of writing it. Since St. Gregory, attempts had been made to improve musical notation. Already the seven letters, formerly written on one line, were placed on parallel lines, to indicate the rising and falling of the voice. Guido, instead of repeating the letter, wrote it at the beginning of the line, and each time it occurred, marked a point on the line. He ended by placing the points within the lines, thus rendering the written composition more compact. Guido has the fame of being the inventor of the modern gamut. His method was in general use until the end of the last century. Guido wrote several pieces, the two most important of which are the *Micrologus* and the *Argumentum Novi Cantus inveniendi*, which explains his system of notation.

ARETINO, PIETRO, a celebrated Italian writer of the 16th century. He was born at Arezzo on the night of April 19, 1492, being the natural son of a gentleman of Arezzo named Luigi Bacci. He was brought up by his mother, a woman named Tita. While still very young, he was obliged to leave his native city on account of having written a sonnet against

indulgences, and went to Perugia, where, for a long time, he supported himself as a bookbinder. Thence he went on foot to Rome, in the hope of bettering his fortune, was received into the house of Agostino Ohisi, a rich merchant, and obtained employment in the service of Popes Leo X. and Clement VII.; but, having composed 16 sonnets for as many licentious designs of Giulio Romano, he was forced to retire to Arezzo (1524). Thence he shortly after passed to the court of Giovanni de' Medici, who was at that time in the service of Francis I. of France, and who was also father of Cosmo, duke of Florence. At length he returned to Rome, where he made love to the cook of Monsignor Giovanni Mattei Giberti, president of the court of requests under Pope Clement VII., and composed a sonnet in her praise. A Bolognese gentleman, Achille della Volta, burned with the same culinary fires, and finding Aretino one day alone, rushed at him with jealous rage, stabbing him 5 times in the breast and maiming his hands (1526). Disgusted at the refusal of the pope to punish this assassin, Aretino left Rome, resolving never to return, and sought once more the court of Giovanni de' Medici. This protector, however, was soon lost to him, having been struck by a musket-ball in a combat toward the close of the year 1526. He expired soon after in the arms of Aretino, who now resolved to have no more protectors, but to live in the full enjoyment of liberty, supporting himself by his pen. With this view he removed to Venice (March 25, 1527), where he was well received by the doge Andrea Gritti, who, not liking to hear him speak ill of Pope Clement, strove to reconcile them, and, at length, in 1530, Aretino acknowledging his fault, the pope wrote him a *breve*, and promised him his sister in marriage. The bishop of Vasone, major-domo to the pope, being this same year with the emperor Charles V., wished to have Aretino knighted by him; but the poet refused, saying he did not wish for honors without incomes. In 1543, when Aretino came with the ambassadors of the republic of Venice to meet Charles V., while on his passage into Germany, the emperor not only wished to have him near, but caused him also to ride at his side, held a long conversation with him, made him a present in money, and recommended him strongly to the Venetian government. Once more Aretino went to Rome, in company with the duke of Urbino. He had previously received from Pope Julius III. the rank of Cavaliere di San Pietro, and hoped to be created cardinal, but came away with empty hands, sad and disgusted again. During 1557, having heard of some outrageous obscenities of which his infamous sisters had been guilty, he found them so comical that he threw himself back in his chair, laughing; the chair was thrown over backward by the shock, and he struck heavily upon his head. The blow was so serious as to cause his death. He was buried in Venice, in the church of San Luca, without any inscrip-

tion. He showed both taste and skill in painting and sculpture. His vices were pride, gluttony, and sensuality. He had no wife, but many mistresses, by whom he left several daughters. The number of pensions, presents, and distinctions he received from princes and great lords, was extraordinary. Many sonnets were written in his honor; he was called the divine, and, from his satires, the scourge of princes. He was a member of various celebrated societies; no less than four medals were struck in his honor, which have come down to our time. On the other hand, he was many times stabbed and bastinadoed, and two disgraceful medals were struck in derision of him. Gifted with a fervid genius, he held a distinguished place among the literati of his age, and his works, both in prose and poetry, were in the highest degree applauded and sought after. Yet he had little or no knowledge of Latin, and none of Greek, and boasted that he had never been to school, and never had a teacher. He composed with great facility, and wrote in strange variety, works either sacred, profane, satirical, or obscene, boasting that with a bottle of ink and a bundle of paper he could make a thousand scudi per annum.

ARETIUS, BERNARD, a Swiss botanist and theologian, born in Berne in 1805, died April 22, 1874. He studied philosophy, and after filling the chair of logic in the university of Marbourg for a year, returned in 1849 to Berne, where he remained for the rest of his life. He embraced with zeal the doctrines of Calvin, and wrote a number of theological treatises, marked by much controversial ability. His leisure hours were devoted to botanical excursions among the Bernese mountains, and his researches in this field have gained him a distinguished name in the annals of science.

AREZZO (ARRETUM), a city of Tuscany, of about 10,000 inhabitants. It was one of the principal states of ancient Etruria. Its walls are undoubtedly Etruscan, and were of importance to the Romans as a barrier against the Cisalpine Gauls. The consul Flaminius, while acting against Hannibal, had his headquarters here previous to the disastrous battle of Trasymene, and when Cæsar marched upon Ariminum, he sent Antony with 5 cohorts, to occupy Arretium. It was celebrated for its terra-cotta vases, ranked by Pliny with those of Samos and Saguntum. They are of red clay, with stamped patterns, and an interesting collection of them may be seen in the museum of the present city. During the contest of the Guelphs and Ghibellines, Arezzo fought against Florence, but was finally obliged to yield. Among the public buildings are the magnificent Loggia, by Vasari, the cathedral, the churches of Santa Maria della Pieve, and Badia di Santa Flora, the Fraternalite, the Museo Bacci, in which is a large Etruscan coin weighing upward of 2 pounds, and the Palazzo Pubblico, which has upon its front a curious series of the armorial bearings of the successive podestats,

amounting to several hundreds. Arezzo has given birth to many distinguished men, such as Mæcenaz, Petrarck, Vasari, Guido Aretino (the inventor of musical notation), Leonardo Bruni, Pietro Aretino, and Count Foscombroni.

ARFE, HENRIQUE DE, an artist born in Germany, who settled at the beginning of the 16th century at Leon, in Spain, and executed, soon after his arrival, a silver tabernacle for the cathedral of that town, which was chiselled so admirably that he received similar commissions for the cathedrals of Cordova and Toledo, and the Benedictine monastery of Sahagun. His most remarkable work, which took him 7 years, from 1517 to 1524, is his tabernacle for the cathedral of Toledo. Its form is hexagonal, the style Gothic, and it is adorned with 260 statuettes, beside many bas-reliefs, and other ornaments. This tabernacle, which was gilded by Francisco Nerino in 1524, absorbed not less than 5,292 ounces of silver and gold, and is a superb monument of Henrique's genius.—ANTONIO DE, Henrique's son, acquired also distinction in the same art, but was not equal to his father. In 1544 he executed two tabernacles, one for the cathedral of Santiago, another for the parish church of St. Maria de Medina de Rioseco. Antonio preferred the Grecian and Roman styles to the Gothic, which was the favorite style of his gifted father.—JUAN DE ARFE Y VILLAFANZ, Antonio's son, born at Leon in 1585, died at Madrid in 1595. He studied anatomy at Salamanca, and passed some time at Valladolid, which in the middle of the 16th century was the Athens of Spanish artists. He made his debut with a tabernacle for the cathedral of Avila, on which he spent 7 years, from 1564 to 1571. He was remunerated at the rate of 12 ducats for every mark of silver employed. Subsequently he executed a tabernacle for the cathedrals of Seville, Burgos, Osma, and for St. Martin's church at Madrid. His Avila tabernacle was one of the most beautiful tabernacles of Spain. His Seville tabernacle is the most imposing, but the one in the cathedral of Osma, the smallest in size, and in which he had the assistance of his son-in-law, Leones Fernandez del Moral, was the most finished in design and execution. He also produced some good engravings on lead. He was a man of remarkable versatility of talent.

ARGÆUS, MOUNT, is the loftiest mountain of Asia Minor, height 13,000 feet, circumference of base, 60 miles; area, 300 square miles. It is isolated except on the south-east slope, where it is connected to a branch of the Taurus chain. The lowest line of snow is 11,700 feet.

ARGALI (*ovis ammon*), the mountain sheep, the big-horn of the west of the Rocky mountains, the *ahrehta* of the Indians. It is nearly of the size of a deer, which it resembles in its coat of short, harsh hair, of a grayish yellow color, with a reddish or blackish stripe along the back, and a large spot on the rump of the same color. In winter its color is of a deeper and redder hue, with the throat and belly white. It has very

large laterally twisted horns, like those of the common ram, rising from near the eyes with a curvature backward, then forward, and with a forward and outward divergence of the tips of the horns. They are transversely waved or wrinkled, for something more than half of their length, but are quite smooth and polished toward the points. The horns of the female are much smaller than those of the male, and more resemble those of the goat. The mountain sheep are found in great numbers on the elevated mountain ranges of northern Asia, on the steppes of Siberia, the highlands of California, and the Rocky mountain range of America. They live in herds on the highest summits, feeding on lichens, mosses, and small shrubs. They are extremely shy, watchful, and timid. Their swiftness of foot is amazing, and their agility in bounding from rock to rock is unsurpassed by that of any quadruped. They can only be stalked with the greatest care, upwind, or shot from ambush. During the rutting season, under the influence of sexual excitement, the males become extremely pugnacious, and fierce combats take place for the possession of the females. The flesh of the young mountain sheep is said to be tender and delicate, but that of the old males is apt to be very rank and disagreeable. The hide, from its soft and spongy character, is of little value for leather, though it is used by the Indians in common with deer-skin, to which, however, it is very inferior in quality. The argali is said to be the origin of the common domestic sheep, to which, however, it bears but a slight resemblance. It is stated, however, that the domestic sheep, when transported to warm climates, loses its peculiar wool, and assumes a coarse coat of straggling, reddish hair, when it comes greatly to resemble the argali. This animal was first distinguished as an inhabitant of the United States by the exploring expedition of Lewis and Clark, although it had been previously recognized as a native of California by Veregas. The best description of this animal, with the distinctions between it and what is called the "woolly" sheep, which is really a goat, with short black horns and a beard, is to be found in Irving's "Adventures of Captain Bonneville," and there are also full accounts of both animals, with a characteristic engraving of them, in Frank Forester's "Field Sports."

ARGALL, SAMUEL, born in Bristol, England, in 1572, and died in 1689. He was one of the early adventurers to Virginia, and deputy-governor of that colony for two years. He makes his first appearance in the colonial annals in the year 1609, as an enterprising trader, making several voyages in the exercise of his calling. His first public exploit was the abduction of Pocahontas, in 1612, whom he inveigled from the care of a chief, who had been intrusted by Powhatan with the charge of his daughter. The temptation to the perfidious chief was a brass kettle. Taking her to Jamestown he gave her to the governor, Lord Delaware. This was

under the third charter of James I. After the departure of Lord Delaware and the deputy-governorships of Sir Thomas Dale, George Percy, and Gates, Argall became deputy-governor, a post he occupied for 2 years from 1617. He was one of the greatest tyrants who ever ruled in America, bringing the despotism of the quarter-deck into the forests of Virginia, and so outraged every law that even in his own council he found bitter opponents, who procured his recall. He was succeeded in 1619 by George Yeardley, and returned to England soon after with immense wealth. He was a rude sailor, utterly uncultivated, and of great rapacity, with no higher motive than intense avarice. At the same time, he was a reckless soldier, having, during the governorship of Dale, commanded an expedition which sailed to Port Royal, in Nova Scotia, which place he reduced and plundered, driving the French colonists into the woods. It has been stated on the authority of English printed works, that on his return to Virginia he appeared before New York, then New Amsterdam, and summoned the Hollanders to surrender, on the ground that Henry Hudson, the discoverer, was an Englishman, and that the sovereignty accrued to his sovereign. This account, however, has been carefully sifted by Brodhead in his "History of New York," who arrives at the conclusion that the whole story is fabulous. Argall, even in that day, was considered a pirate, and was certainly detested by the colonists, against whom he enforced the rigors of martial law with extreme severity. After the death of Lord Delaware, Argall took charge of his estate, and letters of his countess now in existence accuse him of the most flagrant and barefaced peccation.

ARGAND LAMP, a lamp invented by Aimé Argand, of France, in 1789. The principle of it consists in the use of two metallic cylinders, one within the other, between which is the circular wick connecting with the oil below. The inner cylinder is open at top and bottom, and through this, when the chimney is placed upon the lamp, a current of air is drawn up, which feeds the inner surface of the ring of flame, while the external surface is fed by air passing up outside of the outer cylinder. The oil is thus thoroughly consumed, and gives its maximum of light. The contraction of the chimney just above the burner is an ingenious contrivance for turning the current of air and concentrating it upon the flame. This form of lamp is applied to the uses of the chemist with great advantage for heating crucibles, &c.; and it may be made much more powerful by blowing into the inner cylinder a current of air or of gas.

ARGELANDER, FRIEDRICH WILHELM AUGUST, a German astronomer, born March 22, 1799, at Memel, Prussia, educated at Königsberg, a pupil in astronomy of Bessel, and his assistant in the observatory. In 1823 he took charge of an observatory at Abo, where he remained till the observatory was burned in 1828,

and then superintended the building of the new one at Helsingfors. In 1837 he was appointed to his present post of professor of astronomy and director of the observatory in Bonn. His labors have been particularly directed to the fixed stars, and the investigations of their motions, including the movement of our sun among them.

ARGELÈS, an *arrondissement* in the department of Hautes Pyrénées, France; area, 528 square miles; pop. in 1852, 42,558. It is divided into 5 cantons, and subdivided into 99 communes.

ARGENS, JEAN-BAPTISTE DE BOYER, marquis d', a French writer, born at Aix, in 1704, died in 1771, at Toulon. He was intended by his family for the profession of law, but he preferred the army. After one or two years of service, he made an escapade to Spain, in company with a charming actress, with a view of marrying her, but was overtaken by his relatives, who, in order to make him forget his beloved "Sylvia," as he calls her in his "Mémoires," dispatched him to Constantinople as secretary of legation to the French embassy. On his return from Turkey he again joined the army; but during the siege of Kiel, a fall from his horse disabled him for military service. As his father had disinherited him, he took to literature to support himself, and availing himself of the liberty of the press in Holland, he published there his *Lettres Juives*, *Lettres Chinoises*, and *Lettres Cabalistiques*, which attracted the attention of Frederic William I. of Prussia, who wished him to come to Berlin, but D'Argens would not go, because, as he wrote in apology to the prince, he was afraid that his tall figure would tempt the old king to enrol him in his army. However, after the accession of Frederic II. to the throne, the marquis went to Potsdam, and was appointed director of the fine arts of the academy of Berlin, and was on the best of terms with the king, until he married an actress without asking the royal consent. His most important work is his *Histoire de l'esprit humain*.

ARGENSOLA. I. BARTOLEMÉ LEONARDO DE, a Spanish historian and poet, born at Barbastro, in Aragon, in 1566, died at Saragossa about 1631. He entered the church, was made chaplain to Donna Maria of Austria, and, after his visit to Naples, a canon of Saragossa. His works are a continuation of Zurita's "Annals of Aragon," "A History of the Conquest of the Moluccas," and some poems. **II. LUPERON LEONARDO** DE, brother of the preceding, born in 1565, died at Naples, in 1618. At the age of 25 he went to Madrid, and was made secretary to the princess Maria of Austria. Philip III. appointed him historiographer of Aragon. When the count of Lemos received the viceroyalty of Naples he made Argensola his secretary. He wrote 8 tragedies and some poems. The brothers, from the purity of their style in poetical composition, have been called the Horaces of Spain.

ARGENSON, RENÉ LOUIS VOYER, marquis d', born 1696, died 1757, a scion of one of the great historical families of France, originating in Touraine, where, from time immemorial, they had been owners of the estate of Paulmy, as well as of that from which they took the name of Argenson. In 1741 Louis XV. appointed René minister of foreign affairs, and he held this office until 1747, when the intrigues of Spain, whose policy he had frustrated in his negotiations with Italy, brought about his resignation. From that time to his death he devoted himself exclusively to science, and became the intimate friend of Voltaire, who declared his *Considérations sur le gouvernement de la France* to be worthy the pen of Plato.—**MARCO PIERRE**, comte d', brother of the preceding, born in 1696, died in 1764, was for some time secretary of the war department under Louis XV., but his principal claim to the gratitude of posterity rests on the services which he rendered to science. D'Alembert and Diderot began their *Encyclopædia* under his auspices, and he furnished Voltaire with the materials to his *Siècle de Louis XIV.*—**MARCO ANTOINE RENÉ**, nephew of the preceding, born in 1722, died in 1787, was governor of the arsenal, and distinguished himself by the splendid collection of 150,000 volumes with which he endowed the library of that institution. He edited 40 volumes of *La bibliothèque universelle des romans*, including some of his own romances. He was ambassador in Switzerland, Poland, and Venice, but, on being disappointed in his hopes of obtaining the Roman mission, he resigned his public offices and devoted himself to literary pursuits. He was a member of the French academy.—**MARCO RENÉ VOYER**, a member of the same family, born at Paris in 1771, died there in 1842, served for a considerable time as adjutant of Gen. Lafayette. In 1809 he became prefect of Deux-Néthes, but relinquished his place on finding that his determination to protect the constitution against the despotism of Napoleon was not supported by the ministry. He took an active part in the expulsion of the English from Walcheren, as he happened to find himself at Antwerp when they landed. During the Hundred Days he was a member of the house of representatives, and in conjunction with Lafayette and Benjamin Constant, he belonged to the deputations of Haguenau, who besought the allied forces to prevent the return of the Bourbons. In 1815, as member for Belfort, he distinguished himself by his eloquent denunciation of the massacre of the Protestants in the north of France. In 1830 he reentered the chamber of deputies as member for Strasbourg, and on that occasion created a great sensation by taking his parliamentary oath with the words *Je le jure, sauf les progrès de la raison publique*. In May, 1832, he was one of the opposition members who signed the famous *Compte rendu*, and in Oct. 1833, he signed the manifesto published by the society of *Des droits de l'homme*.

He was one of the chief leaders of the secret society *Charbonnières démocratiques*, and was designated as the future dictator of France, in case of a revolution.

ARGENTAN, the chief town of a district in the department of Orne, France. It is agreeably situated on a hill in the midst of a fertile plain. Its principal church offers a fine specimen of Gothic architecture. It contains a college, manufactures of linen and lace, called *point d'Argentan*, tanneries, &c., and is a market of some importance for cattle, cheese, and butter. Pop. 6,044.

ARGENTARO, the highest of the Balkan mountains, between Servia and Macedonia, in European Turkey.

ARGENTEUIL, a town of France, 18 miles N. W. of Paris, on the Seine, known for its brisk wine and some remains of an ancient nunnery where Heloise retired after the misfortune of Abelard, before she became abbess of the Paraclete. Pop. 4,377.

ARGENTEUS CODEX, an old uncial MS. of the 4 gospels, written or stamped in silver letters (except the initials, which are in gold) on violet-colored vellum, in the Mæso-Gothic dialect. It is supposed to have been executed about the 6th century, and is a copy of the version made in the 4th century by Ulphilas, the Arian bishop of the Mæso-Goths. This codex was discovered in the library of the Benedictine abbey of Werden, Westphalia (1597), and after changing hands, either honestly or by stealth, several times, came at length into the possession of the library of Upsal, for the consideration of £250. Fac-simile editions of some portions of it have been published by Knittel, and also by Maio (1819). Maio has also discovered some palimpsests of this version in the Ambrosian library, which have been published. These more recent discoveries have aided to fill the chasms in the Argenteus Codex, and so to enhance its value to biblical literature.

ARGENTIERA, ARGENTARIA, or ΚΗΜΟΛΙ (anc. *Olmolus*), one of the islands of the Grecian Archipelago. It was celebrated among the ancients for its earth or chalk (*ἡ κίμωλος γη*), used in medicine, and by fullers. Silver mines were formerly worked here, which gave the name to the island. It is about 18 miles in circuit, and is in lat. 36° 49' 8" N. long. 24° 38' 5" E.

ARGENTINE CONFEDERATION, THE (*Confederación Argentina*). The states forming the confederation bearing this name have not been the same at all periods of its history. From the first, as now, however, it has been composed of a number of states lying upon the sources of the Rio de la Plata, or Silver River, of South America, and from that fact is taken its name of the Argentine or Silver Confederation. The country, including the state of Buenos Ayres, which has been until recently an important member of the confederation, embraces all that part of South America which lies between the river Paraguay on the east

and the Andes on the west. It is bounded on the north by Bolivia; is separated on the east by the Paraguay from Brazil, Paraguay, and Uruguay (sometimes called the Banda Oriental); is washed on the south-east by the Atlantic ocean; divided on the south-west from Patagonia by the Rio Negro, and on the west from Chili by the Andes. It lies between the 20th and 40th parallels of south latitude and 56 and 70 degrees west longitude, covering an area of about 780,000 square miles. The mouth of the Rio de la Plata, through which the waters of the greater part of this territory empty into the sea, was discovered by Juan Diaz de Solis in 1512. The settlement at Buenos Ayres (fine air) was begun by Don Jorge de Mendoza as early as 1535, and parties under his orders proceeded to the exploration of the country, reaching as far as Asuncion on the Paraguay river, in about lat. 26° S., now the capital of the republic of Paraguay. Many settlements were made in this century, and some progress made in the civilization of the Indians, under Don Juan de Garay, who was made lieutenant-governor about 1580, these provinces being then considered a part of the viceroyalty of Peru. In 1620, under Philip III. of Spain, a new government was formed, including the provinces on both sides of the Paraguay, and called that of Rio de la Plata. In 1776, most of the same territory was erected into a viceroyalty, with Buenos Ayres as its capital. In 1806 the country was invaded by a British army, and Buenos Ayres was captured, but it was held only a few months. At the time of the French invasion of Spain, the country was much convulsed, but for a time admitted its dependence upon the mother country. In 1810, however, the colonists deposed the viceroy, and established a provisional government of 9 persons, in the name of Ferdinand VII. Cordova, Paraguay, and Uruguay, refused the authority of the new government, and a long series of civil conflicts ensued. The return of Ferdinand VII. to power did not bring a colonial policy which was satisfactory, and in 1816 a congress was held at Tucuman (July 9), in which the independence of the provinces was declared. Although there was an attempt to make the Argentine confederation the successor of the whole viceroyalty of Buenos Ayres, it was impossible to combine the various interests into one republic, and serious struggles ensued in the attempt to produce this result. The want of a homogeneous character in the people, and the conflicting ambitions of various leaders, resulted in the formation of two republics, Paraguay, on the upper waters of the Rio de la Plata, and Uruguay, now the "Oriental Republic" (at one period of its history called Monte Video from the name of its chief city, and always spoken of, from its position, as the "Banda Oriental"), at the mouth of that river, beside the Argentine confederation proper. The province of Uruguay was for a long time the continual theatre of war, being claimed by both

Brazil and the Argentine confederation, while chiefs of its own were attempting to secure its independence. In 1825, however, the Argentine confederation was established as a federal union of 13 independent states, it being agreed that the captain-general of the province of Buenos Ayres should be charged with the foreign relations of the whole confederacy, and act as its supreme executive. These 13 states, whose general position upon the map we have already indicated, are occupied by a scattered and mixed population, estimated in 1855 at about 1,200,000. The most important was Buenos Ayres. Next in population and influence were Tucuman, Santa Fé, and Cordova. The rest were Entre Rios and Corrientes, Catamarca, Rioja, San Juan, Mendoza, and San Luis, Salta, and Santiago. In most of these provinces there was then, and indeed there is still, but one large town, the centre of a pastoral, an agricultural, or a mining population, scattered over a large extent of country. Buenos Ayres has but one town (the city of that name); all the rest of its domain, an area of 75,000 square miles, being divided into estancias for the raising of cattle. Santa Fé was the only town in the province of that name; Bajada the only town in Entre Rios. The sizes of the different states was and is extremely various. The grazing states are very large; those which have something of an agricultural character are somewhat less, while those, like Catamarca, devoted almost wholly to mining, are comparatively small. The character of the population was equally varied. There was almost a feudal aristocracy in the north; in the wide ranges of the pastures the herdsman felt and exercised a rude power; and there was a greater degree of moderation in the agricultural states. There was very little element or bond of union.—Buenos Ayres as the only seaboard state, and as much the richest, naturally took the lead, both in preparing the way for independence and in forming the confederacy. The higher classes of her inhabitants possessed immense wealth, both in lands and other property. Many of them had been educated in Europe, and had introduced into South America the refinements of a high civilization, and hoped to extend those refinements over their whole country by means of a form of government. But under their ideas this government was to be wielded by the rich and educated classes. Their party, which called itself the Unitarios, succeeded in framing the constitution of 1825, under which the nation was represented by a small aristocracy. Rivadavia, as captain-general of the province of Buenos Ayres, was the first and only president of the confederation under this constitution. The greater part of this large province took its political bias from the independent and republican tone of the cattle drivers and herdsmen who knew their power, and were not averse to asserting it. They soon found a leader in Juan Manuel de Rosas, one of the *gauchos*, or cattle drivers of the interior, who

had some reputation and some army-rank in the revolutionary combats, and began about this time, at the age of 82 years, to take part in political affairs. He made his residence the centre and himself the leader of all the operations against the Patagonian savages, and thus secured the confidence of the peasantry, and was subsequently able to control the coöperation of the savage tribes. He had opposed the Unitarios at the time of the union, although unsuccessfully; but, by 1827, he had acquired sufficient influence, and found himself certain of the aid of other popular chieftains, such as Bustos, governor of Cordova, Ibarra, commandant of Santiago, and Quiroga of Rioja. They protested against the constitution and government of 1825, took up arms in force in support of their protest, and compelled Rivadavia to resign his post without a battle.—In July, 1827, they chose Dorrego governor of Buenos Ayres. But the established army of the republic soon after got up a counter-revolution under one Lavalle, an officer of some distinction. He defeated Dorrego and Rosas, and shot the former without a trial. Rosas and Quiroga, with Lopez of Santa Fé, formed a new league, and Lavalle was obliged to yield to their superior force. He resigned his post and Rosas was chosen in his place. We have given this much space to these events because they resulted in placing at the head of the confederation the man who remained there for many years. He was reëlected governor of Buenos Ayres, a position which placed him at the head of the foreign relations of the confederation, and gave him a very general control of its internal affairs, as often as his term expired, until 1835, when he refused to be again a candidate. Five times the honor was tendered to him and as often refused. He was then offered, and accepted, the dictatorship for 5 years, and the appointment was twice renewed. He held the office until 1852, and was the sole and uncontrolled ruler of Buenos Ayres and practically of the Argentine confederation during the whole of that time. From 1827 to 1852 there was no meeting of the national congress or constituent assembly. It is difficult to say with what degree of moderation he exercised these unlimited powers. He has been represented as an arbitrary and bloody tyrant, and accused of the treacherous murder of all the friends who placed him in power. He certainly ruled with a strong hand, and was neither slow nor scrupulous in his means of defending or of advancing himself. But he maintained a government under which his country increased in population and material prosperity, notwithstanding continual internal dissensions and foreign wars, and retained a strong and generally triumphant party of friends until the last.—Upon the idea that all the provinces of the former vicerealty of Buenos Ayres belonged to the Argentine confederation, a contest was long kept up to attempt to bring into it the states of Paraguay and Uruguay. The former, protected in part

by its natural position, and more by the policy of isolation and the strong executive power of its singular dictator, Francia, almost entirely escaped foreign conflict. But, as we have already mentioned, the latter was constantly claimed both by the Argentine confederation and by Brazil. Its independence (under the name of the republic of Montevideo) was at last acknowledged by a treaty mediated by Great Britain in 1828. But this did not check the ambition of Rosas to include the other seaport of the Rio de la Plata in his dominions, or bring peace to the Banda Oriental. By the treaty, the Argentine confederation agreed to protect and sustain the government of Montevideo, and this was made an excuse for frequent interference in the formation of that government, even by force of arms. Oribe, the governor of Montevideo at the time of the treaty, was a partisan, if not a creature and tool, of Rosas. To him there was a strong faction opposed, led by Fructuoso Rivera, a man of great popularity with the country population, who had raised himself to influence much in the manner employed by Rosas himself in Buenos Ayres. The matter came to a war, first of blockades and then of armies, between Oribe supported by the Argentine confederation on the one hand, and Rivera sustained by the Argentine exiles in Montevideo, and also by a French fleet, on the other. The intervention of the French was induced by a quarrel which had arisen between a French vice-consul and the dictator. After much mixed fighting, in which no party obtained a decided advantage, the French difficulty was settled by the appointment of a new consul, and in 1840 a new treaty of peace, of much the same tenor as that of 1828, was made between the confederation and Montevideo. This peace was not of long duration, and in 1845, Oribe being the regularly elected president of the republic of Montevideo, and the Rivera faction in the armed occupation of its principal city, Rosas was "assisting and protecting" the former with an armed force. This was the occasion of an "armed intervention" by Great Britain and France, on the plea of enforcing the treaties of 1828 and '40, and restoring peace to the Rio de la Plata. Mr. Ouseley on the part of the former and M. Deffandis for the latter, conducted the negotiations with Don Felipe de Arana, the minister of foreign affairs of Rosas, but without result, and hostilities were commenced by the allied fleets in August. They blockaded Buenos Ayres, and took possession of the peninsula of Martin Garcia, above it, but met with some severe reverses on land. The next year their fleets were withdrawn, the support of the Oriental republic being left in the hands of Brazil, which had taken sides with the Rivera faction against the Argentine confederation. This war occupied Rosas for many years, while the opposition party in his own state was gradually becoming too powerful for him. This party was, as had become too common in these states, now armed and acting in conjunction with the natural enemy, and at the battle

of Monte Caseros, Feb. 3, 1852, Rosas was defeated by the united forces of Brazil, the Oriental republic, Paraguay, and Urquiza the leader of his own opposition. Rosas escaped to England. By a convention of the representatives of the different states and powers held at St. Nicholas, May 31, 1852, the chief power was given to Vincente Lopez as provisional governor of the province of Buenos Ayres. But on the 28d of the next month, by a sudden *coup d'état*, having the army at his disposal, Urquiza put himself at the head of the government as dictator, not 5 months after the deposition of the last. The first use of his power was to acknowledge the independence of Paraguay, which was done by treaty June 28, 1852. That independence has since been acknowledged by the United States of North America, France, England, Sardinia, and other states, and has not again been interfered with. He also secured, by treaties, the future free navigation of all the rivers flowing into the La Plata, a wise measure which took effect in the next October, and remains in force to the present day. But this new assumption of dictatorial power produced immediate irritation. It was but a short time since Urquiza had been only a chief of *gauchos*, compelling the proud and refined Buenos Ayreans to tremble before his rude lances, and his continuation in power depended upon his constant presence at the seat of government and head-quarters of the army. In September, he was obliged to leave Buenos Ayres to attend the meeting of the congress at Santa Fé. He had hardly left that city when (Sept. 11, 1852) a revolution showed itself, and Valentine Alsina was chosen governor of Buenos Ayres. To show the sort of patriotism which mingled with these changes, it may be recorded that the new government immediately voted that \$5,000,000 should be paid toward the expenses of those who had created the insurrection. Of this, 2 generals received \$227,000 and 2 majors, \$128,000. But it must be recollected that from the depreciation of the currency, these sums are quite nominal. The province, with this government, determined to maintain itself as a state independent of the confederation, and another revolution, which changed the governor temporarily, in the month of December, did not alter this purpose. The congress of the confederation did not assemble until November 20, all the states being then represented except Buenos Ayres, and Urquiza was instructed to suppress the rebellion in that state. It met again Jan. 22, 1853, and went on with the work of forming a constitution. It also recommended the president to take all means to stop the civil war and bring Buenos Ayres back to the confederacy. For this purpose an armistice was agreed upon, and a project for a treaty of peace signed early in March, but this fell through from constitutional scruples of Urquiza, founded on the convention of San Nicholas, and the war was renewed and Buenos Ayres blockaded.—The new constitution of the confederation, and that which

is still in force (1857), was promulgated May 1, 1853. It was framed in the hope and apparent expectation that Buenos Ayres, the richest and most important, as the only maritime state of the confederacy, might be induced to return to it, and fixed that city as the capital. The constitution, in its general features, resembles that of the United States of North America, as being a federal government of independent states. It guarantees the free navigation of the rivers, and provides that there shall be no duties on goods carried from province to province; grants to foreigners all civil rights; provides for their naturalization after 10 years' residence—which term may be abridged in the discretion of congress—and makes other provisions for the encouragement of immigration. It went into effect at the end of the year. Urquiza was chosen president for 6 years from March 5, 1854. The seat of government was established at Bajada del Parana, in the province of Entre Rios. Meantime, in Buenos Ayres, a new constitution had also been formed in January of the same year, but not without a hope expressed, and provision made, for a future return to the confederation. This, at one time not long after, seemed probable. That province was invaded by a party of filibusters under one Costa, and Urquiza was suspected, or at least accused, of having fostered this movement. This he promptly denied, and sent his forces to help to repel them. This friendly act failed to bring about an entire reconciliation, but 2 treaties of peace and good will between the parties were the result, signed at Buenos Ayres Dec. 20, 1854, and Parana Jan. 8, 1855. They provide for independent governments, but contain stipulations for much mutual assistance. Each guarantees the other against the dismemberment of its territory; they agree to unite in case of foreign peril; former general laws are to remain in force in civil cases, and criminal cases not of a political nature; they are to give each other mutual aid against Indians; no renewal of passport to be required in crossing the frontiers; the vessels of war of both nations are to carry the national banner; neither shall levy duties on the productions of the other. Urquiza continues (1857) president of the Argentine confederation, and Pastor Obligado has just been reelected governor of Buenos Ayres, for a term of 5 years. But the constitutions of both having been prepared with a view of reunion, much effort has been made for that purpose. But while all steps toward it have thus far failed, and while the interests of the country more and more demand it, the passions of public men in both states make it more and more difficult. Upon the unanimous request of the congress of the confederation, negotiations were reopened on the subject Oct. 10, 1855, and M. Juan Bantista Pena was sent to Parana for the purpose. But it afterward transpired that his authority only extended to making some modification of the existing treaties, and not to merging the 2 sovereignties. This fact becoming public, produced much irri-

tation in the confederation, at the same time that another event produced an equally angry feeling at Buenos Ayres. On Dec. 24, 1855, some Argentine refugees from Montevideo, under the lead of Gen. Floras, embarked at Santa Fé, in the territory of the confederation (indeed, just opposite the capital), to invade the province of Buenos Ayres. Gen. Mitre easily beat them back, and in his turn invaded the province of Santa Fé, in which step he was sustained by his government. Upon this, not only was the mission of Pena closed, but the Argentine government signified to him (March 18, 1856), that the treaties of Dec. 20, 1854, and Jan. 8, 1855, were annulled. In his message of the ensuing May, Urquiza said to his congress, that peace with Buenos Ayres rested, for the future, "only on the guarantee of the conscience and honor of the national Argentine government." The result has been a war of finance and commerce, injurious not only to the states themselves, but to the foreign nations who were beginning to deal largely with them. On July 19, 1856, the congress at Parana, on the suggestion of government, passed a law establishing differential duties upon all goods brought in by way of Buenos Ayres, which went into effect Feb. 1, 1857. Foreign merchandise coming directly to ports of the confederation will continue to pay the ordinary duties; but if they have touched at Buenos Ayres they will pay double that duty, unless subject to a specific duty, and if they are so, to an additional duty of 30 per cent. upon their value. In this contest Buenos Ayres has the advantage of the habits of trade, of the natural methods of navigation, and of its own business importance. The confederation, on the other hand, represents the larger part of the country, and is considered as the national government by most foreign nations. The principal powers have, however, now, diplomatic agents accredited to both governments. The government of the confederation has strengthened itself by treaties of amity and commercial reciprocity with Brazil, England, and the United States of North America, and one with Chili, intended to develop a commerce across the Andes, by free trade across that frontier; and the independence of Paraguay and the Oriental republic has been again recognized and guaranteed. The government is seeking to encourage immigration, and foster large enterprises. Attempts at colonization are making at Corrientes and Santa Fé, roads have been built, and the reconnaissance has been made for a railroad from Rosario to Cordova. The Paraguay has been explored by Capt. Page, of the United States navy, in the steamer Water Witch as far as Mato Grosso, in Brazil; the Salado, by the same officer in the Yerva, for 120 leagues above Santa Fé, and the Vermejo was navigated for the first time, almost from its mountain source to Corrientes, by Mr. Hickman, another American, in 1855. There is also much activity in the province of Buenos Ayres. Immigration is increasing, and great efforts are

making to encourage it by grants of land and the formation of new villages. A railroad is planned from the city toward San José de Flores, to the westward. A company has been formed within a year to light the city with gas. For the year 1854, 781 ships, measuring 175,856 tons, were entered inward, and about the same number cleared. The exportations for that year, of the products of the country, were valued at \$14,571,256.—We have already mentioned the general position of the states which have formed, or now form, the Argentine confederation, and have given their names as they group themselves upon the map of the country. We now give a list of them in alphabetical order, with an approximate statement of the population of each, in 1855. Buenos Ayres, 400,000; Ostamarca, 45,000; Cordova, 90,000; Corrientes, 45,000; Entre Rios, 50,000; Mendoza, 40,000; Rioja, 20,000; Salta, 55,000; San Juan de la Frontera, 25,000; San Luis, 25,000; Santa Fé, 20,000; Santiago del Estero, 48,000; Tucuman, 60,000. These estimates probably include, in some instances, the nomadic Indians, who, although not hostile, are hardly to be considered citizens of the several states, and in some instances do not include them.—These states, covering an area larger than that of Great Britain, France, and Spain, united, embracing every variety of soil and temperature, traversed by rivers navigable from the spurs of the Andes to the shores of the Atlantic, are thus, it will be seen, occupied by a little more than 1,000,000 of people. The productions and occupations of the country are, however, varied, because of the variety of situation and capacity. Cattle form the most valuable property, and immense numbers of them are kept upon the large breeding estates, or range amid the luxuriant pasturage of the plains. Hides, skins, hair, horns, bones, salt meat, and tallow, therefore, furnish a large part of the exports. The number of heads of cattle has been estimated at 4,000,000, and of horses, mules, &c., 2,000,000. Cotton, tobacco, rice, cocoa, sugar, and other productions of tropical countries are raised, with wheat and other grains. The fruits grown are chiefly those of southern Europe, such as the orange, fig, olive, peach, apricot, apple, pear, and grape. Gold and silver are found in the Andes and in the Sierra de Cordova, a series or system of hills in the middle of the southern part of the country; iron and lead exist in small quantities. Coal is said to be plentiful in the south-west, with sulphur, alum, and mineral pitch, near the Andes; but of none of these, are important mines worked. The mountains occupy the western and northern portion of the territory; and the fertile valleys of the rivers which flow from them to unite in the broad estuary of the La Plata, separate most of the remainder of the country into extensive ranges, which are either covered with rich vegetation or made desert, by the efflorescence of salt. The south-western part of the country, which is not connected by rivers with the La Plata, has been very little explored.

ARGENTRE D', a noble family in Brittany, distinguished in Breton annals as early as 1060. Its most celebrated scion was Bertrand, born at Vitré in 1519, died 1590. He became the champion of the feudal rights of the Breton seigneurs against the attempt of Du-moulin to modify the common law of Brittany by introducing the spirit of equality, which breathes through the civil law. D'Argentré was nominated commissioner for the reform of the "custom of Brittany," and instead of relaxing it, voted always to make it stricter. Brittany in this matter resisted the French movement of law reform, just as earlier she had remained Celtic when the rest of France became Roman, and as later she remained monarchical and orthodox, when the rest of France had become republican and atheistical.

ARGIVES, the inhabitants of Argolis or Argos, a Greek province. During the Trojan war the Argives were the most prominent among the Greek tribes. Agamemnon, the chief of the expedition, the most powerful and the richest among the Greeks, was an Argive. For this reason Homer often uses the name of Argives as a generic appellation for all the Greeks, and many other classical writers follow his example.

ARGONAUTS, the name of the earliest heroes of Greek antiquity, who according to the legend, at least half a century previous to the Trojan war, executed the first daring navigation on unknown and dangerous seas. The name comes from the ship Argo, expressly constructed for this purpose, of oak from the Dodonian groves, which had the power of prophecy. Pindar was the first to celebrate the deeds of the Argonauts, but other poets, as Apollodorus, Apollonius of Rhodes, a pseudo-Orpheus, Onomacritus, and the Roman, Valerius Flaccus, treated the same subject. On this account the legend is variously explained and has different features. The story more generally accepted is the following: Jason, the son of Æson, was ordered by Pelias, his uncle, sovereign of Iolcus, in Thessaly, to reconquer and bring back the golden fleece of a ram on which Phrixus and Helle ran away, and which fleece was nailed by Phrixus to an oak in the grove of Ares (Mars), and watched by a sleepless dragon. Jason intrusted Argos, the son of Phrixus, with the duty of constructing a 50-oared ship named after the builder, and invited all the heroes of Greece to join him in the adventure. Orpheus, Castor and Pollux, Theseus, Hercules, and many others, 50 in number, answered the appeal. The Argonauts landed first in Lemnos, where they stayed 2 years. The Lemnian women detained them so long, having previously killed all their own men, for their having offended Aphrodite (Venus). From Lemnos the Argonauts went to the Dolians, by whom they were first hospitably received, but being afterward taken for Pelasgians, they were attacked and in the naval strife which followed Jason killed the Dolian prince. Then they landed in

Mysia, where Hercules and Polyphemus were left on account of their remaining behind in search of Hylas, who had been carried away by a nymph. In the land of the Bebryces they were challenged by the king Amycus, to a boxing contest, and the challenger was slain by Pollux. Then the wind drove them to the shores of Thrace, to Salmydessus, where they asked the advice of the seer Phineus, how to pass between the Symplegades or the swimming rocks of the *Ægean*, which crushed every thing in their way. By the advice of Phineus the Argonauts let loose a dove, which coming between the rocks lost only her tail, while the *Argo*, piloted by Hera (Juno), suffered only a slight damage in the stern. From this moment the Symplegades never moved. Thence continuing the exploration of various lands, the navigators finally reached by night the mouth of the Phasis in Colchis, the goal of their expedition. *Æetes*, the king of the country, promised the fleece to Jason, but under the condition that the hero should yoke to a plough 2 fire-breathing iron-footed bulls—a gift of Hephaestus (Vulcan), and sow the teeth of a dragon left by Cadmus in Thebes. Medea, daughter of *Æetes*, and a powerful witch, fell violently in love with Jason, and he promising marriage, she taught him how to overcome the dangers, and gave him a charm against fire and steel. Advised by her he threw a stone among the warriors who sprang up from the teeth of the dragon, and who being thus enraged killed each other. After this deed was accomplished, *Æetes* wishing to evade his promise, intended to burn the *Argo* and to kill the heroic crew. Medea told Jason of it, who ran to the grove, seized the fleece, the sleepless dragon having been lulled by Medea. Then with his paramour and her brother Absyrtus, Jason sailed off by night. *Æetes* chased them, and Medea killed her brother and threw the chopped limbs one after the other into the sea; the father gathered them up, and was thus prevented from reaching the fugitives. The Argonauts entered the river Eridanus, but lost their way in a storm. The Dodonian mast of the *Argo* told them that the storm was sent by Zeus, and that the wrath of the god would continue until they should sail to Ausonia (Italy) and be absolved by Circe. They coasted Liguria, the land of the Celts, and through the sea of Sardinia arrived at the Tyrrhenian shores and along them to the island of Circe. Having fulfilled the atonement, they left and coasted near the islands of the Sirens, from whose enticements they were preserved by the songs of Orpheus; then they passed between Scylla and Charybdis helped by the goddess Thetis, and arrived at the island of Corcyra. Then they were overtaken by a storm, and saved by Apollo, who, amid lightnings, pointed to them the island Anaphe, the modern Naxos. In Oreta, Talos, the giant, tried to prevent their landing, but Medea despatched him. Thence they went to *Ægina*, and passing between Euboea and Locria

finally reached Iolcus. This voyage on their return lasted 4 months. The *Argo* was consecrated by Jason on the Isthmus of Corinth to Poseidon (Neptune). So ended the expedition through the Black and Mediterranean seas, the first recorded in the heroic-historical legends of Europe.

ARGONNE, *Formerly* *or*, the former name of a region comprised in the department of Meuse and Ardennes, France. It forms a plateau, partly wooded, and lies between the basins of the Aisne and Meuse.

ARGOON, a river of Tartary, which rises from Dalai lake or Kaulon-nor, situated in long. 119° 14' E. and lat. 49° N. It forms the boundary between the Chinese and Russian empires. This river is thought to be the original source of the Amoor.

ARGOS, or *Argolis*, is the north-eastern part of the Morean peninsula, between the bay of Nauplia and *Ægina*. The eastern continuation of the northern mountain range of the Peloponnesus surrounds, as with ramparts, a part of the inhabited shores, which bear marks of volcanic convulsions, and the plain of Argos, which is fertile, but rendered unhealthy by marshes. The most eminent mountainous groups are the Malevo, called by the ancients Artemision, 5,434 ft.; the Hag-Ilias, very anciently called the Arachnaton, 8,076 ft.; and the Didyma, 8,800 ft. The largest plain is situated near the city Argos, behind the bay of Nauplia, watered by the river Planitza, the classical Inachus. Only a few other spots are fit for agriculture, on account of the want of water, as all the streams except the Inachus and the Erasimus, now called Kephalaria, dry up. But the many bays render Argos favorable for navigation. In antiquity Argos, or Argolissa, was strictly the plain surrounded on the west by the Arcadian mountains, and on the north by those of Phleiss, Oleona, and Corinth. In the Roman epoch Argos represented the eastern part of Peloponnesus, bounded on the north by Achaia and Corinth, on the north-east by the Saronian bay, on the west by Arcadia, on the south by Laconia, and on the south-west by the bay of Argolis. Argos belongs to the earliest cultivated regions in ancient Greece. Inachus (1800 B. C.) and Danaus (1500) landed from Egypt and settled in Argos. Here ruled Pelops, who gave his name to the peninsula, and, in various single states, his descendants, Atreus, Agamemnon, Adrastus, Eurystheus, Diomedes, heroes of the primitive legend. In Argos was born Hercules, or Heracles; here, near the marshes of Lerna, he killed the hydra, in the cavern of Nemea he strangled the lion. From the remotest times Argolis was divided into the smaller kingdoms of Argos, Mycenæ, Tiryns, Træzene, Hermione, and Epidaurus, which all afterward formed republics. After the emancipation of Greece from the Turkish sway, until the year 1838, Argos formed one of the 7 departments into which the Morea was divided. Argolis, or Argos, now forms a

government of the kingdom, with about 90,000 inhabitants, Spezzia and Hermione being subordinate provinces. Nauplia is the capital. The ancient city of Argos has preserved its name from the remotest to the present times. The inhabitants have been celebrated for their love of music, and within its walls, as well as in Delphi, were statues to the brothers Biton and Cleobis, renowned in the classical world for having sacrificed their lives for their mother. The city suffered much in its capture by the Venetians, in 1686, and its recapture by the Turks, in 1706.

ARGOT, the general name for the modes of expression current among criminals and outcasts in France. The etymology of the word is surrounded with the same darkness which hovers around the class who inaugurated its use. There has at all times existed a most lamentable freemasonry among the adepts of vice, and in all countries we find them induced to adopt a fictitious language as a fit exponent of their thoughts, and as a prudential measure for the purpose of escaping detection. The English vocabulary has no special name for such dialects, but characterizes it by the general term of thieves' Latin, slang, &c. In Italy rogues use the so-called Fourbesh languages, of which several vocabularies exist, among others, various editions of the *Nuovo Modo da Intendere la Lingua Zerga, cioè parlar Furbesco*. In Spain the criminal language wears the name of *Germania*, from the Latin *Germanus*, and several words of it having been used in "Don Quixote," as well as in another of Cervantes' novels, entitled *Rinconete y Cortadillo*, and in various other works, a Spanish amateur of Argot, Juan Hidalgo, compiled a book upon the subject, which passed through 6 editions, the first appearing in 1609, under the title of *Romances de Germania de Varios Autores, con su Vocabulario, &c.* In Portugal a novel appeared in 1844—*Frei Paulo, ou os Doze Mistérios*—written by a member of the Lisbon academy, Corvo de Camões, in concert with other Portuguese men of letters, in which a great number of words of the *Calao* (this being the name for the language in vogue among Portuguese criminals) are introduced. In Germany the name of the language is *Rothwälsch*, composed of low, high, Jew, and Gypsy German, but possessing a grammar and almost a literature of its own. One of the earliest and most curious books on the subject, *Von den Falschen Bettlern und ihrer Buberey*, was brought out at Wittenberg, in 1528, with a preface written by no less a personage than Martin Luther. In Holland the name of the language is *Bargoens*, or *Dieventael*. In Scandinavia we find, beside the *Fantasprog*, or Argot language, which is spoken of in Sund's work, published at Christiania in 1850, *Om Fante-eller Landstrygerfolket i Norge*, the *Tatereproget*, or gypsy gibberish, and the *Skiviersproget*, or the jargon of vagabonds, much in vogue among the rascals of Norway, Sweden, and Denmark. The Berlin

prostitutes have adopted a language of their own, as is the case with the same class of persons generally, especially the Egyptian Cyprians, known under the name of *Ghannases*. Among the German Jews a mysterious language is frequently resorted to, but more for playful than for criminal purposes, which is called *Erbseensprache*. The Jews generally patronize miscellaneous gibberish, and in the dark corners of the ghetti Jew Argot languages exist, although Hebrew genius has hitherto neglected to publish dictionaries and cyclopædias of the same. In Albania an Argot language is spoken which presents a singular compound of modern Greek, Wallachian, Italian, Latin, with a slight dash of original invention, and which is chiefly used by quack doctors, the fictitious verb expressive of exercise of the medical profession (which in these regions is not in the best hands), *karakiani* (ευν, being synonymous with cheating. Asiatic criminals and outlaws speak the *Balaibalan*, a fictitious language bearing some resemblance to the Arab, Persian, and Turkish vocabularies, and a cue to which is to be found in Silvestre de Sacy's essays on the subject, in *Notices et extraits des manuscrits* (vol. ix. pp. 365-396), and in the *Journal Asiatique* (1822, vol. i. p. 141). The Indian Thugs speak the *Ramaseena* language, a vocabulary and history of which appeared at Calcutta in 1836, while a book published on the Thugs in the ensuing year by Wm. Allen and Co., of London, is calculated to throw further light upon the same subject. These are the only two Asiatic languages of the kind of which we have historical evidence, although many others are supposed to exist.—Though criminals resort to fictitious languages in all countries, nowhere has this propensity reached the artistic perfection to which it has attained in France. The Argot language of the worthless characters of France has unfortunately found a very conspicuous place in modern French novels, especially in Eugène Sue's *Mystères de Paris*. Indeed, the novel-reading public found it so difficult to unravel the language used by Sue's chief characters, as *le chourineur*, *le maître d'école*, and *la chouette*, that it became necessary to publish a *Dictionnaire complet de l'Argot employé dans les Mystères de Paris*, which is to be found in all the book-stores of Paris. Victor Hugo, in his *Dernier jour d'un condamné*, narrating the impression produced upon his mind by a young girl who sings a song in the Argot language, says: "Je ne saurais rendre ce que j'éprouvais; j'étais à la fois blessé et caressé. Le patois de la caverne et du bagna, cette langue ensanglantée et grotesque, ce hideux Argot, marié à une voix de jeune fille, gracieuse transition d'une voix d'enfant à une voix de femme! tous ces mots difformes et mal faits, chantés, cadencés, perlés!"—"I could hardly express my sensations; I felt shocked and pleased at the same time. Think of the jargon of the bar-room and the galley, of this bloody and grotesque language, of this hideous Argot, wedded to the voice of a young

girl, a voice in its graceful state of transition from childhood to womanhood! all these mutilated, ungainly, clumsy words, clothed, as it were, with the charm of song, music, and harmony." In the Argot language the ludicrous goes hand in hand with the terrible, and the picturesque with the criminal. So we find the word *tire-monde* used in the sense of a *sage-femme*, *moucharde* and *cafards* for the moon, *philosophes* for cheap shoes, *palpitant* for heart, *la carline* for death, *sorgus* for night, *cuisins* for police, *ouverage* for theft, *travailler* for stealing, *etourdir* for murdering, *le courrier de Haute-Mont*, *Haore*, *le grand Haore*, and *Mec des Mec* for God, *entiffier* for marrying, *entonno* for church, *esbasir* or *ombre* for assassinating, *Goddem* or *Roebif* for Englishman, *minuit* for negro, *orient* for gold, *mère Thomas* for a broken stool, *épouser la sœur* for being hanged, &c., all these words being more or less susceptible of etymological explanations and illustrations. The last-named, for instance, is taken from one of the religious plays of the 15th century representing the crucifixion, in which the two thieves on their way to the cross are addressed by Orillart as follows:

Le beau gibet épouserie,
Pour estre de nopces tous troya.

The beautiful gallows you shall espouse,
And there we three will pay our vows.

So, too, *Guillaume*, brown bread, is said to refer to an actor of that name who was formerly a baker, and who, when subsequently embodying the character of a baker upon the stage, irresistibly reminded the spectator of brown bread. The whole Argot vocabulary is made up of such humorously or fantastically concocted words, scattered over the grotesque, satirical, and erotic literature of former times, or borrowed from the gypsy or kindred languages of other nations. In 1827 a dictionary of Argot, written by *un monsieur comme il faut et co-pensionnaire de Sainte-Pélagie*, was published at Paris. But the prosperity of Argot literature dates more particularly from 1828, when Maurice and l'Héritier (de l'Ain) brought out the *Mémoires de Vidocq*, founded upon data furnished by that noted functionary himself, who, until 1827, filled the office of *chef de la police de sûreté*, and who was, of all men in Paris, the best authority upon the subject. In 1837 appeared his work on thieves, containing the Argot dictionary which he had begun in 1819, at the request of the prefect of police. It was this publication of Vidocq's dictionaries and revelations which gave such a remarkable impulse to the Argot literature. Since then various other works upon the Argot language have been published, of which Michel's *Etudes de philologie comparée sur l'Argot, développement d'un mémoire couronné par l'Institut de France*, published in 1856, by Didot, at Paris, is the most valuable.

ARGOUT, ANTOINE MAURICE APOLLINAIRE, comte d', a lucky French statesman and financier, born in 1783 in the department of Isère.

When scarcely 20, he entered the treasury department, where he was promoted from office to office during the empire. From 1812 to 1814 he acted as general superintendent of the navigation of the Rhine. On the restoration of the Bourbons, he did not hesitate to abandon his former master for a new one, and by great zeal rapidly rose to posts of eminence. As early as 1815 he was appointed master of requests to the council of state, and prefect of Basses Pyrenees; in 1817 he was transferred to the more important prefecture of Gard; Jan. 1819, he became a councillor of state in ordinary service, and in March following a peer of France. When the revolution of 1830 broke out, he interfered and tried to prevent the effusion of blood; on the 28th of July, in concert with Semonville, the grand referendary to the chamber of peers, he repaired to the chateau of St. Cloud, where Charles X. then was, to obtain the recall of the ordinances, which were the direct cause of insurrection. Their mission was successful; but when they brought the happy result to Paris, Gen. Lafayette answered: "It is too late," and the terms which they had to offer were not even entertained. D'Argout, who had no taste for fallen fortunes, quickly went over to the new government, and was even more favorably treated by the Orleans king than he had been by the Bourbon, as may be seen by the following list of his promotions to office: secretary of the navy in 1830, secretary of commerce and the public works in 1831, home secretary in 1833, governor of the bank of France in 1834, secretary of the treasury in 1836, then again in the same year governor of the bank. The revolutionary government of February did not even think of his removal, and Louis Napoleon maintained him in his post until July, 1857, when he withdrew. He was created a senator by a decree of Jan. 16, 1852.

ARGUELLES, AGUSTIN, Spanish statesman, born at La-Riba-de-Sella, in Asturias, in 1775, died March 28, 1844. He was sent on a mission to Portugal, and soon after to London on special business. On his return from England he joined the patriots in their efforts against the French, and became a member of the cortes of Cadiz. His employment in foreign affairs by the government and the liberal tenets which he professed, won him the confidence of his party, and he was one of the committee charged with the preparation of the new constitution, which under the title of the constitution of 1812, reduced the kingly power to the very narrowest limits, rescued the ancient municipal government of the provinces and towns, and gave ample representative rights to the people. After Ferdinand VII. was restored, this constitution was abrogated in May, 1814. Arguelles was seized and thrown into prison, and finally sentenced to 10 years exile in Ceuta. Here he made himself friends, and the government, alarmed at his growing popularity, imprisoned him in the Balearic island of Cabrera. When the revolution of 1820 broke out, his partisans

forced the king to accept Arguelles as minister of the interior. But he had not practical knowledge and the business capacity which fit men for power. He was obliged to resign, and took his place in the cortes as leader of the moderate party. When Ferdinand at last restored the most absolute despotism, Arguelles fled to England, where he remained until he was recalled in 1833 by the regent Christina. In the cortes he exercised all his powers against the government party until the accession of Mendizabal to power, when he joined him with the expectation of restoring the constitution of 1812. In 1836 he was appointed a member of the council of regency after the exile of Queen Christina. In 1837 the queen appointed him a member of the senate. In 1841, on the motion for the sale of ecclesiastical lands, he warmly opposed any compromise with Rome. He was appointed tutor to Isabella and her sister, a post which he retained until 1843. He died of a fit of apoplexy. He must not be confounded with José CANGA ARGUELLES, another Spanish statesman of the present century.

ARGUIN, an island 8 miles from the west coast of Africa, lat. 20° 27' N. long. 16° 37' W. Its surface is composed of white rock and drifting sand, and it furnishes excellent water. The bank of Arguin extends from Cape Blanco to Cape Mirik, west coast of Africa.—Also a town of Western Africa, on the coast S. E. of Cape Blanco.

ARGURI, formerly a large and beautiful village in Russian Armenia, 186 miles S. from Tiflis, on the N. E. slope of Mount Ararat, 5,400 feet above the level of the sea. The inhabitants, about 1,600 in number, supported themselves by rearing horses and growing corn, and also by cultivating the vine, which, according to a local tradition, was first planted there by Noah when he left the ark. A little distance from Arguri, up the mountain, was the monastery of St. James, the residence of Parrot and his companions during their exploration of the mountain. In 1840 the monastery and the village were entirely overwhelmed by an eruption of Ararat, and of all the inhabitants and monks, numbering nearly 2,000 persons, only 114 who were engaged in the fields escaped. Since then the wells and fountains in the vicinity have sent forth only a discolored and sulphureous water.

ARGUS, a creature of ancient mythology, said to have had a hundred eyes, or, as others say, eyes all over his body, of which only 2 slept at once. He was set by Juno to watch the priestess Io transformed into a white cow. He was lulled to sleep by Mercury, who played soothing tunes on the pipe of Pan, and then slew him with his crooked sword.

ARGYLE, DUKE OF, head of the great Scottish clan of Campbell, of nearly the oldest Celtic descent in the Highlands. His patronymic, Mac-alain-Mor, the son of Allan the Great, corrupted into Macallum More, is the favorite title of the Highlanders for their chief-

tain, and has been more valued by the possessors than the hereditary title which belongs to the head of the house. The greater part of the county of the same name, bounded on the south by the Irish sea and the frith of Clyde, including the wild districts of Ardnamurchan and Morven, the isles of Mull, Jura, Islay, Bute, and Colonsay, and containing some of the most magnificent scenery of the western Highlands, formerly belonged to this powerful and wealthy clan, the principal residence of its chief being Argyle castle, at Inverary, the scene of some of the most romantic incidents in Sir Walter Scott's "Legend of Montrose." Several of the chiefs of this house were men of considerable abilities, and played remarkable parts during the stormy political periods of the 16th and 17th centuries. One earl of Argyle, in the reign of Queen Mary of Scotland, having joined the association of reformers, known as the congregation of the Lord, was involved in conspiracies against the queen, and forced to fly to England, for the preservation of his life, but was subsequently invited to return by Darnley, and was reconciled to the queen. His family always continued to be energetic reformers, and were invariably hostile to the house of Stuart, which enmity was maintained and exaggerated by the fact that the royal family of Scotland was strenuously supported by the noble house of Graham, and its chief, the duke of Montrose, the feudal and hereditary opponents of the Campbells. In the year 1689, Archibald, the then earl of Argyle, "a man," according to Hume, "equally supple and inflexible, cautious and determined, and entirely qualified to make a figure during a factious and turbulent period," embraced the covenant, became one of the chief leaders of that party, and the head of the Scottish malcontents. He was a man of great political audacity, coolness, resource, and intrepidity, but of no military skill, or even courage. In the campaign of Montrose, in the western Highlands, he was not only baffled, out-maneuvred, and defeated by that able and gallant partisan, but deserted his army, and incurred strong imputations of cowardice, from which his character is only redeemed by the dignity and firmness with which he afterward met his death on the scaffold. When Montrose was at last overpowered by his enemies, and put to death, with every indignity and insult which political malignity and religious intolerance could devise, it is said that Argyle had the cruelty and ungenerous brutality to triumph openly at the downfall of his personal as well as political foe, and the window is still shown, out of which he is said to have gazed complacently on the passage of the rabble rout, by which the noble cavalier was conveyed, bound ignominiously with ropes, in a common cart, with the executioner riding before him, to the place of execution. When Charles II. was in Scotland, with the army of the covenant, which had then joined his cause against the parliament, although Argyle went with his party, he

never had any real intimacy with the king, and though nominally employed as his principal gentleman in attendance, in reality held Charles nearly as a prisoner, until disgusted with the indignities, and annoyed beyond endurance by the formalities to which he was subjected, the king endeavored to escape from the state of semi-captivity in which he was held.—After the defeat of the royalists at Worcester, and the capture of Stirling castle, Dundee, Dumfries, and all the fortified places in Scotland, by Gen. Monk, Argyle gave in his submission to the parliament, and Scotland was at length reduced to total subjection. On the return of Charles II., and the restoration of the crown to the house of Stuart, Argyle was brought to trial, in spite of two several acts of indemnity, either of which really formed invincible obstacles to any legal conviction of this nobleman for any of his overt offences, so that he was tried only for compliance with the usurpation of Cromwell, and the commonwealth, a crime of which, if it were a crime, as Hume has well remarked, the whole nation was equally guilty with himself, and which no degree of loyalty could have prevented him from committing, since he had no option but to obey a force which he had no means of resisting. In spite of this, however, he was convicted, sentenced, and executed, and the ungenerous cruelty of his conduct toward the noble and unfortunate Montrose, prevented him from receiving the sympathy which he would otherwise have met, and to which the calm and dignified fortitude with which he encountered his death surely entitled him. The son of this nobleman, who, when Lord Lorne, during the life of his father, had been distinguished by his loyalty, and who having never swerved from the royal party, had escaped the forfeiture of his estates for his father's treason, early in the ensuing reign, in his strenuous support of the Protestant ascendancy, and his opposition to the exemption of princes of the blood royal from taking the test-oath, gave such mortal offence to the duke of York, afterward James II., that in consequence of that prince's influence with his weak and easy brother, Argyle was put on his trial for high treason, leasing-making, and perjury, and was condemned and sentenced to death, without a semblance of cause, or any evidence against him, for innocent words spoken in debate. The king, however, caused the sentence to be recorded, and the execution of it to be suspended until further orders. Not having, however, any confidence in this seeming clemency, Argyle escaped to Holland, where he kept himself concealed, and in retirement, until after the accession of James II., and his intolerant and illegal measures in endeavoring to overthrow the Protestant institutions of England, and establish on their wreck the long-proscribed church of Rome, when, in conjunction with the duke of Monmouth, a natural son of Charles, he returned in an evil hour to England, and set up the banner of rebellion in his native land, while Mon-

mouth was engaged in the fatal rising of the west of England, which terminated so disastrously in the total defeat of Sedgemoor, and in the barbarous and bloody executions which followed it. Argyle had not even the temporary show of success, which gleamed at first on the banners of Monmouth, for he was defeated and taken prisoner within a few days of landing; and with his stubborn Protestantism, and the personal hostility which the cruel, inflexible, and narrow-minded man, who then sat on the throne of England, bore to him, it was, of course, out of the question that he should escape the same sentence which was so rigorously executed by James on his own brother's son. The marquis of Argyle died, as his father had done before him, with dignity, and without a tremor, and with his death the disloyalty of this noble family came to an end, for since the exclusion of the Stuarts from the succession to the English crown, the heads of the clan Campbell have been as much celebrated for their faith to their princes, as for their high spirit, and their ardent love of their country.—
 GEORGE JOHN DOUGLAS, 8th duke of Argyle, born April 30, 1828, succeeded to the title April 26, 1847. At an early age he acquired some celebrity by writing a "Letter to the Peers, from a Peer's son," on the free church question. It is asserted that in the hour of trial he failed to carry out the principles therein avowed. In 1848 he wrote an anti-Roman Catholic work, entitled "Presbytery Examined." In July, 1844, he married the Lady Constance Gower, daughter of the duke of Sutherland, whose vast Scotch estates adjoin his own. In consequence of his great landed influence, and the active part he took in political matters, he soon acquired a position, and became, as postmaster general, a member of the cabinet in the Palmerston ministry.

ARGYLESIRE, a western county of Scotland, comprising about 2,000,000 acres or one-tenth of the surface of Scotland. It is remarkable for its picturesque character rather than for cultivation or populousness. The population indeed is perhaps the lowest in the British isles, not exceeding 32 to the square mile; nor is there any probability of considerable increase, for the policy of the great land owners of that district has been to remove the tenantry, and to create extensive sheep-walks. This policy has been the subject of considerable reprobation, and it has been epigrammatically alleged that the man has been removed for the sake of the brute. The peculiar character of the Highlander, his fixed attachment to the habits of his ancestors, his incurable aversion to that every-day labor which can alone improve his position, and the worthlessness of the land for any purpose of agriculture, have been the defences of the landlords, who, it cannot be denied, have expended large sums of money in promoting the emigration of their tenantry. The mountain district of Argyleshire contains Cruachan Ben, rising to the height of 3,669 feet, with many other lofty

hills dear to Scottish hearts, and celebrated in national poetry. The largest of the inland lakes is Loch Awe. The mountains are chiefly of granitic formation. Argyshire is not rich in mineral resources. Lead, copper, and coal are worked, but not in very great quantities. The raising of cattle and sheep is carried on with great success. The moors yield abundance of game, grouse, ptarmigan, and black cock, while the noble red deer yet courses the wastes of his native hills in freedom. The proprietorship of this large county is in few hands. The duke of Argyle, the marquis of Tweeddale, and the marquis of Breadalbane, are the chief landowners. The dukes of Argyle could once bring 8,000 or 4,000 men into the field; but although their feudal influence may have declined, the value of their property cannot but be proportionably increased. There are various natural curiosities in Argyshire, the most remarkable being the columns and cave of Staffa. The most important modern structure is Inverary castle, the family seat of the dukes of Argyle, built of a peculiar stone called *lapis ollaria*, a local production, being a kind of micaceous slate. Dunstaffnage castle is an interesting ruin. Gaelic is still generally spoken in Argyshire, although of late years the English language is better understood, and is gradually superseding the Gaelic.

ARGYRAMMOS, ALEXANDROS, a modern Greek, born 1810, who out of zeal for his native tongue, became a printer, in order to publish at Constantinople the vast Greek lexicon, known by the name of *Kιβωτος*. The 1st volume, containing the first 4 letters, appeared in 1819. During the war of Greek independence he was unable to procure types from western Europe, and he established at Constantinople a typefoundry for the sole use of the lexicon.

ARGYRO KASTRO, a chief town of Albania, on the river Deropol, an affluent of the Boioussa. It is built on the side of a mountain, and the streets are so steep that persons on horseback are obliged to dismount. The streets are separated by ravines, planted with gardens. There is a strong castle which was enlarged by Ali Pasha, and has accommodation for 5,000 men. The population is about 10,000.

ARGYROPULUS, JOHANNES, one of the principal revivers of Greek learning in the 15th century, born at Constantinople, died at Rome, where he held a professorship of philosophy in 1486. In 1484 he came to Italy, acquired the favor of Cosmo de' Medici, and was the instructor in Greek of his son and grandson. In 1480 he removed to Rome. His principal works are some Latin translations of Aristotle. He was strongly prejudiced against the Latin writers, and declared Cicero to have been alike ignorant of Greek and of philosophy.

ARIADNE, according to Homer, daughter of Minos, king of Crete, and of Pasiphae. When Theseus landed at Crete with the tribute of the Athenians for the Minotaur, Ariadne fell in love with him, and gave him a clew of thread

by means of which he found his way out of the labyrinth. Theseus offered her his hand, in token of his gratitude. Ariadne eloped with him, but as they arrived upon the island of Naxos, they were killed by the arrows of Artemis. According to the common tradition, Theseus abandoned her upon the island of Naxos, when Bacchus married her, and after her death transferred the crown which he had given her at their wedding, to the stars. The incidents in the life of Ariadne have been fruitful themes for the fine arts.

ARIALDUS, a deacon and martyr of the church of Milan, born in the village of Euzago, between Como and Milan, in the first half of the 11th century, died at Milan, June 28, 1066. He followed from childhood the bent given him by a religious education, adopted the ecclesiastical profession, and made his first appearance in Milan in 1056. This was the age of Hildebrand, when that mighty promoter of the papacy, though not yet occupying the chair of St. Peter, was laboring strenuously for the reformation of the clergy, the suppression of simony and corruption among ecclesiastics. The church of Milan, mindful of its ancient dignity under St. Ambrose, asserted a sort of independence, and was not inclined to submit to the new discipline. The practice of simony had there reached such an extreme that for every spiritual office a sum was openly paid proportionate to its value, the archbishop Guido himself having obtained his office in this way; and by this traffic many unworthy men had arrived at important stations in the church. Arialdus, who had always led a pious and strictly moral life in his own country village, was scandalized at the immoralities and worldly life of the clergy of Milan, and began to preach to them repentance. They repelled him with contempt, and he then directed his preaching to the laity. He set in opposition to the worldly pride and the illicit connections of the present ecclesiastics, the example of Christ and the idea of a clergy appointed to follow Christ in poverty, purity, and humility. The piety of the young clergyman was so earnest, and his convictions so just, that his discourses were favorably received by the multitude, and the clergy, who by reason of the reverence felt for their office, had hitherto been regarded with respect in spite of their personal unworthiness, gradually became objects of popular contempt and abhorrence. Meantime Arialdus had found an associate in Landulphus, a young man of one of the noblest families of Milan, and a more vehement and popular speaker even than Arialdus. These two preached together throughout the city, exhorting the people to shun all intercourse with the corrupt clergy, and even to refuse the sacraments from them. The whole population of Milan became divided into two hotly contending parties, both of which lodged complaints with Pope Nicholas II. The latter sent two legates, the learned cardinal Peter Damianus, and the archbishop Anselmo of Lucca, to Milan to investigate the affair, who

convoked a synod there for this purpose. But when Damianus, as legate of the pope, claimed precedence of the archbishop Guido of Milan on public occasions, he offended the pride of the Milanese nobility; and even the populace did not like to see the humiliation of their ancient Ambrosian church. The firmness of Damianus succeeded in enforcing the supremacy of Rome, and the spiritual court proceeded to pronounce judgment. Simony was to be renounced by the clergy, but it having been an almost universal evil in the Milanese church, the penalty should be somewhat mitigated toward so large a multitude of offenders; and pardon for the past was to be had by undergoing due penance. Nothing was done to prevent the offences against virtue and against the ecclesiastical law of celibacy hardly less common than the simoniacal practices, and Arialdus complained at Rome of the continuance of irregularities. The disturbances at Milan were, however, quelled until the death of Nicholas, and the election of Anselmo as new pope under the name of Alexander II., when they broke out again with greater violence. Landulphus had died, and his warlike brother Erlimbaldus, just returned from a pilgrimage to the holy sepulchre, joined himself to Arialdus as a popular leader. They went together to Rome, where Alexander II., having assembled a council in which Hildebrand took the leading part, appointed Erlimbaldus the gonfaloniere or standard-bearer of the universal Roman church, and delivering to him the consecrated banner of St. Peter, bade him unfurl it against the enemies of the church whenever he should find it necessary to resort to other than spiritual weapons. He also gave them a declaration by which the archbishop of Milan was excommunicated. The return of Arialdus and Erlimbaldus thus supported, was the signal for bloody commotions at Milan. The people, fickle in their zeal and passions, were powerfully moved by opposite motives. The eloquence of Arialdus inflamed them against the corruptions of the clergy; the memory of the freedom and dignity of the Ambrosian church made them indignant against the assumptions of Rome. Arialdus continued his exertions, but at last fell a victim to the vengeance of the exasperated aristocratical party, being murdered on a desert island in Lake Maggiore, about 10 years after he had preached his first sermon in Milan. His name was enrolled in the list of martyrs by Pope Alexander II. (See Pope ALEXANDER II.)

ARIANO, a town of Naples, 15 miles N. E. from Benevento. It is built upon a steep hill, in one of the most frequented passes of the Apennines, and many of the poorer dwellings are dug into the rock and earth. It is the see of a suffragan bishop, and contains a fine cathedral, 20 churches and convents, several *monti-de-piété*, and an academy. This town has frequently been visited by terrible earthquakes, the last of which happened in 1782. Pop. 11,718.

ARIANS, the followers of Arius (315). The church had early been content to affirm the

existence of 8 persons in the Trinity, without defining their nature and relations to each other. Alexandria was the natural birthplace of the discussions into which those matters were sure, sooner or later, to come, and of which Sabellianism had already given a half century's warning. Arianism takes its rise as a doctrine, in the reply of Arius to a discourse by Alexander, bishop of Alexandria. The bishop maintained that Christ was not only equal to the Father, but of the same essence. This, Arius affirmed, would lead to Sabellianism, being a virtual denial of the tripersonality of God; he claimed that Christ was equal to the Father in power, but only similar in essence, and generated from the divine will, and that "there was a time when he was not." The council of Nice (325) condemned Arius and his doctrines, banished him to Illyrica, ordered his writings to be burned, and decreed consubstantiation as the orthodox faith. Arianism was at first little more than a protest against Sabellianism, and in favor of the orthodox views of the Trinity. But the subject of the nature and relations of the persons in the Trinity once broached, the Arians soon found no agreement among themselves, and fell into two opposing parties, viz.: the strict Arians, or Heterousians, because they believed Christ to be of another nature or essence from God; and the semi-Arians, or Homoiousians, who believed the Son to be of a nature similar to the Father. Both were included under the general term Anti-Nicene, because they opposed the decree of that council. With various fortunes they contended with each other, and with the orthodox or Nicene party, called Homoousians (because they believed that the nature of Christ was the same as the Father's), for more than 300 years, extending their doctrines into Spain and the German states; however, they do not appear to have extended their influence into Britain, so late as the council of Antioch (363). Arianism was more successful, from various causes, in the eastern than in the western church. It is less important in itself than in the movements to which it has been the occasion. Apollinaris, in order to attain what he deemed a better ground for opposing Arianism, than the orthodox one, denied the humanity of Christ. This gradually forced the Arians progressively to the other extreme of denying his divinity, and so began a movement in theology of which the church has yet to see the consummation. Arianism since the middle of the 16th century, has gradually merged itself into what it had originally no affinity with, viz., Socinianism, and out of that has been slowly evolved Unitarianism. The Arianism of Arius does not now exist. Servetus is said to have revived it in the 16th century, and the same thing has been alleged of Erasmus. Arianism was powerfully opposed by Theodosius I., and finally suppressed by law in the Roman empire under Theodosius II. (428), after having been alternately condemned and decreed by councils of bishops for 107 years.

ARIAS MONTANUS, **BENEDICTUS**, a Spanish ecclesiastic and learned oriental scholar; was born in a village of Estremadura in 1527, and died at Seville in 1598. Philip II. sent him to Antwerp in 1568, to superintend the publication of the magnificent edition of the "Polyglot Bible," to be prepared in that city. The task employed him for 4 years, and he was rewarded with a pension of 2,000 ducats, and some profitable offices. His numerous works are principally theological. He was an unyielding enemy of the Jesuits.

ARICA, a maritime town of Peru, capital of a district of the same name, lat. 18° 28' 1" S. long. 70° 24' W. It was formerly the port of shipment for the silver from the famous mines of Potosi. It is still a place of shipment for bullion, and for the trade with Bolivia, of which state it was proposed in 1836 to make Arica the port of entry. It was sacked by Sir Francis Drake in 1572, and has since been much reduced by earthquakes. Population, 3,500; once estimated at 80,000.

ARIEGE, a name common to a river and a department of southern France. The river, rising in the Pyrénées-Orientales, flows northward, and empties into the Garonne, after a course of 90 miles. It was called by the Romans *Anrigera*, from its carrying gold-sand.—The department which derives its name from the river, consists principally of the northern slope of the Pyrenees, and is covered with mountains, which gradually increase as they come nearer to the great chain. It contains valuable iron mines, the ore being in some places auriferous, and large quarries of marble, freestone, plaster, and slate. On the highlands are meadows, where cattle and sheep are raised in large numbers; nowhere in France is the care of merinos better understood. The trade in these sheep and in their wool is considerable. The forests furnish good timber. Bears, wild boars, wolves, foxes, and deer, are abundant. The lowlands are tolerably fertile and well cultivated, producing wheat, rye, oats, maize, millet, hemp, and flax. Vineyards, to the extent of 5,000 acres, yield a wine of inferior quality, all of which is consumed at home. The working of metals is the principal branch of manufacturing industry; but there are beside saw-mills and paper-mills, manufactures of cloth, hosiery, linen, and soap. Pop. 265,907.

ARIEL, a Hebrew name, signifying "Lion of God," i. e. Hero, or city of Heroes, is the name given to various persons in the Old Testament, and also applied to the altar of burnt-offerings, or to the city of Jerusalem, as in Isaiah xxix. 1, 2, 7. Among the Jews of a later period, the name was, in cabalistic parlance, given to a water spirit.—In modern times Shakespeare's genius has thrown a poetical halo over the name of Ariel. In his "Tempest" Ariel is represented as a spirit of air, and as servant of the witch Sycorax, the mother of the ugly Caliban; and being unable to perform her dirty work, she imprisons him in the cleft

of a tree, where the poor fellow remains for 12 long years, until Prospero comes to his assistance.

ARIENZO, a town of Naples, province of Terra-di-Cavaro, on Mount Tifati, and is surrounded with orange and other fruit gardens. It has 7 churches. Pop. 11,000.

ARIES. I. A constellation, the Ram, is the first constellation of the ancient zodiac. It is surrounded by Cetus, Taurus, Perseus, Andromeda, and Pisces. The Greek mythology connects Aries with the golden fleece of the Argonauts. II. In ancient military science, the Latin name for a battering ram; so called because the end of the instrument which punched the walls of beleaguered cities was a mass of bronze or iron made somewhat in the form of a ram's head. The method of withdrawing the aries, and butting it again against the wall, also suggested the appellation.

ARIMASPIANS, a fabulous people of antiquity spoken of by Herodotus. They are described, among other things, as one-eyed, and as countrymen of the dragons who kept watch over the gold, from whom, however, they contrived to beg, borrow, or steal large quantities. They dwelt on the golden-sanded river Arimaspa. Of course the most remote and least known region was selected as their place of habitation. Some place them in Scythia, and others in Sarmatia. Modern commentators say that the gold mines of the Ural mountains gave rise to the fable.

ARINOS, a river of Brazil, province of Matto Grosso; rises in the Parecis mountains, flows north-westerly, and empties into the Tapajós, an affluent of the Amazon. Length, 700 miles.

ARION, a famous musician of Lesbos, and a friend of Periander, king of Corinth. When returning home from Sicily, where he had amassed great riches, the sailors determined to throw him overboard and seize his treasures. Discovering the plot, he begged permission to play one melodious tune before it was put in execution, and, having done so, threw himself into the sea. The dolphins, charmed by his music, carried him on their backs to Tanarus, whence he passed over to Corinth, and on the arrival of the ship had the sailors put to death.

ARIOSTI, **ATTILIO**, an Italian composer, born in Bologna in 1660, and educated for the priesthood, which he forsook for the study of music. He wrote principally operas, which had a considerable reputation throughout Europe in the beginning of the last century. He gave instructions on the harpsichord to Handel, whose musical genius he was among the first to recognize and direct.

ARIOSTO, **LUDOVICO**, an Italian poet, born at Reggio Sept. 8, 1474, and died June 6, 1533. His father, a man of high birth, was a favorite and confidential agent of the ducal house of Ferrara, and was governor of Reggio at the time of the poet's birth. He was not a provident father, and a large family, liberal disposition, and facility in obtaining requisite

means for daily outlay, induced him to enjoy the present rather than secure independence for the future. Ludovico, therefore, the eldest of 10 children, was early aware of the necessity of labor; and, although he had given signs of promise by a juvenile dramatic composition and a Latin oration, he was forced to attempt the study of law. Five years of useless experiment at length obtained him a reprieve; and, just before reaching manhood, he had the paternal sanction to devote himself to the Museæ. His first object was to revive and enlarge his classical knowledge; and, although Latin was then the language of scholars, so refined was his critical appreciation of Horace and Ovid, that he soon acquired fame as a Latinist. In his epistle to Bembo is a eulogy of Gregorio di Spoleto, one of the celebrated men of learning of that era; and this was an offering of gratitude, for to the teaching of Gregorio the poet owed much of his skill in Latin verse. On the death of his father, the same filial obedience and sense of duty which led him, in boyhood, to study law against his inclination, at this sad crisis of his family fortunes, made him self-devoted, patient, assiduous, and careful; so that at 24 he was the guardian and support of his brothers and sisters. This domestic application occupied the greater part of 20 years, during which he acquired social distinction; which, however, appears to have been at first accorded to his acquisitions, wit, and character, rather than to any preëminence as a poet; at all events, his work in the latter vocation was originally of a casual and ephemeral kind—sonnets and elegies which scarcely foreshadowed his elaborate and original epic. He was at this period employed by that ambitious but exacting patron of men of letters, Cardinal Hippolito d'Este. It is an interesting and almost a unique picture, in literary annals, which Ariosto now offers to the imagination;—the head of a large family, each sister to be well married and each brother to be ushered into some lucrative employment—all meantime dependent upon him—a courtier, obliged to be on the alert to gratify his patron and conciliate "troops of friends,"—now busy over his father's accounts, and now directing some household economy; this evening playing the agreeable in a palace and the next teaching his brother Latin; one month absent on an embassy to Rome and the next immersed in business correspondence; yet all the time musing on his favorite theme, seizing from life and nature gleams of truth and fantasy wherewith to enrich his verse, and ever and anon retiring to his birthplace; and there, in a kinsman's villa, in the lonely chamber of an old tower, constructing his wayward, dreamy, fantastic, yet beautiful and most attractive poem. There were adventurous episodes, however, in this life of the court, the family, and the scholar. He was sent by the duke of Ferrara on a conciliatory mission to Pope Julius II., who had long coveted that prince's domain and now sought it through religious pretexts. He

subsequently distinguished himself at the battle of Ravenna, where the papal and Venetian forces were defeated; a second time he undertook an embassy to Rome, but he was badly received and savagely threatened, so that it became necessary for him to escape in disguise. Cardinal Hippolito desired the poet to attend him on a visit to his bishopric of Segovia in Hungary; and his refusal induced a permanent estrangement, notwithstanding the adulation lavished on him so unworthily in the *Orlando*. Ariosto was now asthmatic, and, therefore, unfit to brave a northern climate; many other objections, some of them not a little humorous, he cites by way of apology for not obeying the haughty cardinal. An expensive lawsuit added to the vexations attending his loss of patronage; but, upon Hippolito's death, he entered the service of his brother Alfonso, with whom he became a favorite companion; the duke allowed him to indulge his architectural fancy in building a house for himself in the centre of a garden; but, even with this luxury at command, he was vexed and hampered by precarious means and inadequate resources; he enjoyed certain ecclesiastical revenues and numerous costly gifts from the princes and churchmen of his time, as tributes of admiration or rewards for diplomatic services, but even with the splendid hopes excited by Pope Leo's partiality, and with all the distinction and privileges he enjoyed, his experience only confirms the frail support proverbially realized for literature through princely patronage. Whenever opportunities presented themselves, Alfonso sent him on errands which often yielded him personal honor and emoluments. It was on one of these missions, in a dreary part of the Apennines, that his famous adventure with the robbers, so long traditional in Italy, occurred; they paid little respect to the envoy, but spared and honored the poet. According to Baretti, however, he was surprised by the banditti near his own abode, when, in a fit of abstraction, he walked into the forest in nightgown and slippers. The anecdote, at all events, aptly illustrates the firm hold his verses had taken upon the common heart. As life advanced, he declined offers of employment, and gradually withdrew from official life to the retirement congenial to his tastes. His last years were given to revising and enlarging the *Orlando* and writing his satires; which, in fact, give the chief biographical data of his career, being filled with political, domestic, and personal allusions; they are modelled upon Horace and written in the form of epistles to intimate friends; unfortunately their indecent and licentious passages seriously mar the legitimate rank they might otherwise hold as literary productions. At the close of 1532, the magnificent theatre which the duke of Ferrara caused to be built as an appropriate scene for his favorite poet's comedies, was destroyed by fire. The event is said to have greatly excited Ariosto; he was seized with illness, which his physicians

sacribed to indigestion; and, a few months after, expired. During this fatal indisposition he put the last touches to his immortal poem. Thus left, it consisted of 46 cantos; the other 5 never deemed of equal merit, did not appear until more than 20 years subsequently. To account for the popularity of the *Orlando Furioso*, it is indispensable to remember the age of its production and the circumstances under which it was written. It is an acknowledged distinction which Ariosto enjoys in common with only the father of Greek song, that the common people and the high-bred, the ignorant and the learned, equally delighted in his poem. His fame differs essentially from that of Dante or Tasso; the one demanding a vigorous mind and a refined perception for his appreciation, and the other a chivalric sympathy; whereas Ariosto captivated, at once, the frivolous and the earnest; and those without the least valorous aspiration keenly enjoyed his fanciful and vivacious strain. This universal popularity is owing to his subject and his style; the public of his day were prepared to receive the former, because Bojardo's *Orlando Innamorato* had opened the vein which is elaborately worked out by Ariosto. The associations, too, of knight-errantry were fresh and prevalent; his was an age of courtly splendor, of feats of arms, of trials of intellectual skill and of gallantry, when the accomplished man of the day could equally well handle a sword, improvise a love song, and exercise political sagacity and social tact. Then to be brave, prompt, romantic, splendid in costume, graceful in manner, devoted to lady-love and loyal to duke or pontiff, were the requirements of ambition. Hence the machinery of Ariosto's poem—the combats and the paladins, the lover's devotion and the mad adventures, were congenial to the general fancy; while the easy, nonchalant, animated, and graceful manner in which the narrative is woven, had a singular charm. It was perfectly intelligible, and seemed, however carefully wrought, like a pastime to the writer, such is the apparent facility of its versification. This facile grace "beyond the reach of art" was a marked trait of the poet's genius; another was his fertility and versatility of invention; and still another, the quick transitions of ideas and beauty of comparisons. These elements of popularity we, of a later day, easily recognize; but, at the same time, cannot but find some of his descriptions tedious, and many of his cantos unsustained throughout by the vivacity and genial flow of their first movement. His violations of decency and the sacrifice of all elevation, either of style or sentiment, to clearness and distinct meaning, are perhaps inevitable defects in such a work. The *Orlando Furioso* was first printed at Ferrara in 1516; the next 100 years was prolific in editions; and to-day a group on the mole at Naples listens with avidity to a reader of Ariosto; while the most popular of modern English poets exerted all his powers to reproduce in "Beppo" and "Don

Juan" the careless, gay, and magnetic melody of this popular bard. The principal ancient editions of the *Orlando Furioso* are those of Ferrara, 1516, 1524, and 1532, published under the superintendence of the author, and the Aldine edition of 1545. The best modern edition is that of Morali, 4to, Milan, 1818, which follows the original text of 1582. Of the English translations by Harrington, Hoole, and Rose, the latter is esteemed the best.

ARIOVISTUS, a chief of the Marcomanni, a German tribe, crossed the Rhine with 15,000 warriors at the call of the Sequani, who were oppressed by the *Ædui*, defeated the *Ædui* 72 B. C., but took one-third of the land of his allies for his Germans, and threatened to take more. He invited his countrymen over the Rhine, and made a settlement there of 120,000 strong. The *Ædui* and Sequani called in Julius Cæsar and the Romans to their aid. Cæsar ordered Ariovistus to make no more conquests, to call no more Germans over, and to give up the hostages he held of the Gauls. Ariovistus returned an insolent reply. Cæsar marched against him and compelled him to give battle near Vesontii, now Besançon, 58 B. C. He was defeated, and few of his warriors escaped. His German and his Helvetic wife, and his 2 daughters, fell into the hands of the Romans. He himself escaped across the Rhine in a small boat, and ended his days in obscurity.

ARISMENDI, JUAN BAUTISTA, a distinguished Venezuelan general. When the Spanish general Morillo had besieged and subjugated Carthage, and had at the same time rendered himself hateful to the Venezuelans by his confiscation of their property and other cruelties, Arismendi, in conjunction with Bolívar and Páez, aroused the inhabitants to a fresh resistance, and defeated Morillo in several engagements. In 1819, Morillo being driven from New Granada and most of Venezuela, Arismendi was chosen vice-president of that republic. In the insurrection of Páez, in 1826, during the absence of Bolívar, Arismendi espoused the cause of the constitutional party, and was of material service to Bolívar in restoring the peace of the republic.

ARISPE, a Mexican town, situated in a fertile valley of the river Sonora, at the foot of the Sierra Madre. It was formerly the capital of Sonora, but on becoming involved in the civil wars, which distracted that state in 1828, the seat of government was, in 1832, transferred to Ures. Arispe is celebrated for the rocks in its vicinity, which form 3 columnar masses of about 50 feet in height. The church is the only noteworthy building. Owing to the civil wars and the encroachments of hostile Indians, the population, which once exceeded 5,000, and according to some authorities even 7,000, has dwindled down to 1,500. Mr. Bartlett, while at Arispe in the survey of the boundary between the United States and Mexico, attended mass, and reports that "he found the church filled almost exclusively with women. The

music was performed by a band, in which clarionets predominated, and we recognized among the tunes several of our popular Ethiopian airs, such as 'Dearest May.' The singing was performed by 2 girls, who seemed to have perfected themselves in the art under the tuition of the Chinese. The altar is covered with massive plates of embossed silver, and there is a profusion of this metal display in the shape of massive flower vases, chandeliers, and censers."

ARISTA, MARLANO, a Mexican general, born in the state of San Luis Potosi, Mexico, July 16, 1802, died in Spain Aug. 9, 1855. His father was a lieutenant-colonel in the Spanish army; his mother was also Spanish. His education may be said to have been entirely military, for at the age of 11, in 1818, he was placed in the Spanish army as a cadet, and served till June, 1821, when he joined the cause of independence, and received the commission of 1st lieutenant. He distinguished himself throughout the rest of the year (1821) in various severely contested actions, and obtained for his services the brevet of captain. In December, 1822, Santa Anna, then a general of brigade, revolted against the emperor, Iturbide, at Vera Cruz. The latter sent forces to suppress this revolt, which were to operate under the orders of Gen. Chávarri. Upon the arrival of these forces, however, Chávarri combined with Santa Anna, and a plan was formed among all the principal chiefs, Feb. 2, 1823, called *El acta de Casa Mata*, which resulted in the overthrow of the Mexican empire in the month of March following, and in the establishment of the federal system. Arista's name is first mentioned in the history of Mexico in the year 1825, during the administration of Gen. Victoria. He was a captain in the army, stood well with the government, and was a prominent member of the political party called the *Yorkinos*. This was a body of freemasons, so called, established in the city of Mexico in that year for the purpose of counterbalancing the intrigues of the Scotch lodge or *Escoceses*. In the fall of 1828, Gomez Pedraza was elected president, and Gen. Guerrero, vice-president. Santa Anna, as soon as the result of this election was known, early in September (1828), declared against Pedraza and sustained the election of Guerrero. Arista adhered to the same cause, joined Santa Anna, and remained at his side while they were besieged at Oaxaca, where the latter, with his forces, had been obliged to retire, which was until December of the above-mentioned year, when the successful issue of the revolt, called that of the *Acordada*, in the city of Mexico, finally placed Guerrero in power. Arista was promoted during the first month of Guerrero's administration (April, 1829), to the grade of lieutenant-colonel. While Santa Anna was sent against the Spaniards, Bustamante, the vice-president, received the command of a reserve corps, and was ordered to Jalapa. Arista had a command in that corps. Bustamante revolted, which caused the downfall of Guerrero in December, 1829, and he placed

himself in the presidential chair on the 30th of that same month. Bustamante had, till about that time, been a distinguished member of the *Yorkinos*, a friend of Guerrero and of the other principal men who composed that party, but he now abandoned all and established a central system of government. Arista served his administration faithfully, and was engaged in almost every action that took place, in consequence of the resistance to it, the principal one being the famous battle of the Gallinero, fought in October, 1832. During this administration, he was promoted to the full grade of colonel and to the brevet of general of brigade. Santa Anna rose against Bustamante, and, by virtue of a new election of both congress and president, was chosen for the latter post. He took his seat April 1, 1833. Upon the accession of Santa Anna, Arista was promoted to the full grade of general of brigade, and in the month of June (1833), he was second in command of the army. The acts of the new congress caused a revolt in Michoacan, in the month of May, in favor of religion and church privileges. This revolt was seconded at Chalco by Gabriel Duran, with the troops under his orders. Santa Anna took command of the army in person, and, accompanied by Arista as second, marched against this insurgent, when the latter retired in the direction of Cuernavaca, to the south of Mexico. During this march, however, Arista, with the whole division, joined the movement of Duran, and proclaimed Santa Anna as dictator June 6. Duran and Santa Anna held a conference together, but the latter positively refused the proffered dictatorship, and, after having been detained a prisoner for 4 days, made his escape and returned to the city of Mexico. The plans of Duran and Arista, whatever they may have been, were thus disconcerted. Nevertheless, they advanced to the gates of the capital. On July 7, they made an assault, but were repulsed with loss, and, with diminished forces, retired toward the interior of the country, fortifying themselves at Guanaxtoto. Santa Anna followed, attacked them at that city, where they capitulated in October (1833). For this act Arista was deprived of his rank and expelled from the Mexican territory. He embarked for the United States in November of the same year. He was absent about a year and a half, when, upon an amnesty, he returned, June, 1835. By his letters written at that period, we see that he had resolved to abandon military and political life. But in August, 1836, being officially informed that, by virtue of a general decree of amnesty of May 2, 1835, he had been restored to his rank as brigadier-general, he resumed his position in the army, and in that month was appointed judge of the supreme tribunal of war, which office he held till April, 1837, when he received the thanks of government for his services. In June, 1837, he was named a member of the junta of the military code, and a little later, a member of the consulting council of war. In October of the same year, he was appointed inspector of the active

militia, during which time he reorganized it, and caused it to be instructed, for which service he also received the thanks of the government. In September, 1838, he received the command of a brigade destined to operate against the invasion of the French at Vera Cruz. On his way thither he received orders from Gen. Santa Anna, who commanded in chief, to hasten to that place in advance. He arrived there on the evening of Dec. 4, and on the morning of the 6th, was taken prisoner by the French. About 2 months later he was released on parole. In 1839, the command of a brigade destined against the revolt of Urrea at Tampico, was confided to him, and with only 400 men he caused that general, with a force of 1,200, to surrender. He was next appointed commander-general of Tamaulipas, and upon the close of that year, 1839, he was named general-in-chief of the northern division of the army. Upon his arrival at Monterey, he reorganized the forces, and, after various encounters with the insurgents of the eastern departments, defeated them at Santa Rita, and succeeded in pacifying all that frontier, for which a special cross of honor was awarded him. In the month of September, 1841, he was promoted to the rank of general-of-division by President Bustamante, which was afterward confirmed by Santa Anna notwithstanding other similar acts of Bustamante's government had been altogether set aside. In November, 1841, he resigned this command, but was soon reappointed. He was next deprived of it by a revolution, but on the fall of Santa Anna, in December, 1844, he was again restored, and in a few days caused the government of Herrera, who succeeded Santa Anna, to be recognized throughout the eastern departments. Upon the breaking out of the war between Mexico and the United States, Arista made great efforts to put the eastern frontier in a respectable state of defence, and to increase his brigade to 6,000 men, but he was not supported by the government; and upon the revolt of Gen. Paredes (who made himself president), with the whole division of reserve at San Luis Potosi, Arista was displaced. Paredes, however, upon learning of the approach of the American army toward the Mexican frontier, reinstated him in that command April 4, 1846. He commanded at the battles of Palo Alto, and Resaca de Guerrero. The trial which he had solicited, after the loss of these two battles, was commenced but was delayed during the rest of the war of 1846 and '47, in which he did not serve. It was taken up, however, in May, 1850, when the court decided "that he had complied, in the defence of his country in the battles of May, 1846, with what was demanded by his conscience, his honor, and his obligations." In June, 1848, he was appointed by President Herrera, minister of war. Upon his accession to this important post, his attention was at once directed toward putting all belonging to that department, which, from the late war and other

causes had become greatly deranged, into a proper state. He caused all the artillery to be repaired and renewed; the useless pieces from the different parts of the republic were brought to the capital and recast. A train of 28 pieces had been made in 1850 for the capital, where none existed when he came into office. A new foundry for cannon was established, with all the necessary apparatus. The arsenals were put in order, and factories for the repairing of arms established. Under the auspices of the department, the geographical and statistical society, among other important works, prepared a large map of the republic. The geographical section of the department also prepared a general atlas of the republic, and plans of the ports. The invalids of the army were provided for by placing them in service in the garrison of Mexico. He had long cherished the wish to establish military and agricultural colonies on the Mexican frontiers, and now executed this plan on the borders of the states of Tamaulipas, Coahuila, Chihuahua, Sonora, and Lower California, and in various parts of the interior known as the Sierra Gorda. To each colony an ample grant of land was made, which was parcelled out among the colonists, who were furnished, beside, with agricultural implements by the government. The colonies were free to be settled by others than soldiers, and these settlers enjoyed all the civil rights of colonists in general, being exempt from taxes of every kind, even from church dues. Enlistment for military service in them was voluntary. As long as Arista remained in power, they thrived, but are now in an advanced stage of decay. One of them bore his name.—Gen. Arista displayed activity and good judgment while minister of war, and these qualities were frequently exercised both in the councils of state and in the management of his own department, the result of which was the successful suppression of 17 revolts that occurred at different periods during those 2 years. In the fall of 1850, he was elected president of the Mexican republic, and on Jan. 15, 1851, he entered upon the duties of his office, supported by the majority and the enlightened portion of the inhabitants, but, nevertheless, amidst the murmurs of personal and political enemies. The principal difficulty to be settled was the absolute want of money. The amount of the indemnity becoming due from the United States, had been already disposed of, by the law of 1849, for the regulation of the public debt. The finances were in a state of confusion, and the estimate showed a deficit of over \$4,000,000. Every source of revenue had been forced to the highest pitch, and the outlay greatly reduced. An increase of revenue was, therefore, necessary, and the first care of the administration was to recommend measures to obtain a fixed and steady income. One of the greatest desires of Arista was to comply with the law of 1849, with respect to the public debt, yet he felt the impossibility of doing so under the existing circumstances. The ordinary

session of the congress of 1851 closed without effecting any thing. The two chambers continually disagreed, the senate manifesting, if not a decided hostility, at least an open distrust and opposition to the government, while the chamber of deputies sustained it. A special session was held in April, 1851, when a bill was presented by the department of finance, granting certain powers to the government for the purpose of obtaining a revenue until July, 1852. This bill was agreed to by the chamber of deputies, but rejected by the senate. This session was had solely for the purpose of providing means for the government, but, although it lasted 80 days, nothing was done. An extra session was called on June 1, and as the necessities of the government were pressing, \$250,000 a month was granted it from the American indemnity, which had been reserved to the public creditors. The expenses of the government were stated to be \$10,997,884, and the revenue, \$8,000,000, consequently there was a deficit of \$2,997,884. Certain other measures were now proposed by the government, by means of which, it was stated, this deficit would be covered, and an annual surplus obtained of \$142,000. The states protested against the same, and the matter was dropped. Up to the middle of July, 1851, as the congress had done nothing in the way of producing a revenue, and had refused to accede to the measures which had been proposed by the government for this object, the latter called upon the governors of the states to suggest some plan to congress for this purpose. The governors met in the capital on Aug. 20, and, as if to add to the perplexing situation of the government reported that, instead of a large deficit, they had found that a surplus existed, when, in truth, there was not the necessary funds for the most ordinary daily expenses of the administration. The ministers of finance and of war resigned, the former declaring that his statement of the financial condition was perfectly correct and true. Revolts and other political disturbances now became frequent. Foreign ministers protested against the treatment of their fellow-citizens. The circumstances of the government were, however, taken into consideration, and a new arrangement was made with the creditors in December, 1851. During the latter part of that year, a serious revolt took place in Tamaulipas. The governor of that state, in order to oppose this movement, the object of which was smuggling, took the responsibility to establish a new and reduced tariff. It was not recognized by the government, and caused trouble by reason of continued protests of merchants and reclamations of foreign ministers. The government was pressed on all sides for the want of means, having to suspend, almost entirely, the payment of the interest of the public debt, and even to withhold a part of the salaries of its employees. During the year 1851, various insurrections broke out, but they rapidly increased in 1852. About the middle of this year, Arista had be-

come the object of the most violent attacks from the press. In July, 1852, a faction rose at Guadalajara, and took possession of that city, having a population of nearly 80,000 inhabitants. The legal authorities fled. The ecclesiastical bodies, with the bishop of the state, with various corporations of the same, soon made their submission to what was called the provisional government, proclaimed there. In August, a revolt took place also at Mazatlan, while another was going on at Jalapa. In September, Santa Anna was publicly proclaimed at Guadalajara, and his partisans rushed thither and swelled the numbers of the revolutionists. Congress was called for an extra session, and the governors of the states were also called upon to cooperate with the government in suppressing the revolution. The majority of them promised to do so, but they soon relapsed into apathy, and nothing was done on their part, and even the congress closed without giving the requisite aid. The ordinary session of the congress opened Jan. 1, 1853. The president, upon the occasion, earnestly endeavored to call its whole attention to the prevailing situation, but that body was irresolute or careless; it hesitated while the revolution rapidly increased, and, finally, seeing that the congress did not act, the constitution giving him no authority to adopt the measures suggested to his own mind, and that his endeavors under it were of no avail, on Jan. 5, 1853, Arista delivered the government, as prescribed by the constitution in case of resignation of the president, into the hands of the presiding judge of the supreme court. Arista now retired to his farm in the Llanos de Apam, determined to spend the rest of his days far removed from public life. But his presence was annoying to his enemies, and, though sick in body and at heart, he was banished from the country. He made a voyage to Europe. While on a visit to Spain his illness increased. He set out for France, and died on his way thither at the age of 58, on the same day that Santa Anna, who had usurped his seat, fled from the city of Mexico. His heart was carried to Mexico, according to his own request. The government of Alvarez, in 1857, ordered that the rest of his remains should be brought home at the public expense, and in memory of his services declared him by a special decree, ratified by the constituent congress, to have "merited well of his country," the highest honor the Mexican nation can confer either upon the living or the dead. His bravery was acknowledged. He was a man of strong passions, sanguine in his temperament, as sensitive as a woman, and with a heart as kind. He wrote much, expressed his thoughts and ideas with clearness and vigor, and in a style remarkably concise. He loved agricultural pursuits, and owned an estate, in former years, near Monterey, in the cultivation of which he took much pride. He disposed of that in later life, and purchased one in the Llanos de Apam, to which he dedicated much of his attention. He sought after all kinds of use-

ful improvements in agriculture, and when expelled from Mexico, in 1833, he paid particular attention to the improvements made in agricultural implements in the United States, and on returning to his country, he introduced many of them on his own estate. He was married, but had no children. He accumulated no fortune, and though he owned a valuable farm, he was aided in its purchase by loans from friends. His estate is now under liquidation, and it is found that after all debts are paid, nothing of moment will remain.

ARISTÆUS, the son of Apollo, married the daughter of Cadmus, and became the father of Actæon. He fell in love with Eurydice, the wife of Orpheus, whom he pursued into the fields, where she was bitten by a serpent. For this he incurred the anger of the gods. He taught men the culture of the olive and the management of bees, for which service he was placed among the stars.

ARISTARCHUS, I. The greatest philologist and critic of antiquity, born in Samothrace, was educated at Alexandria by Aristophanes of Byzantium. He flourished in the reign of Ptolemy Philopator, 150 B. C., and his immediate successors. He was the founder of a grammatical and critical school, which long flourished at Alexandria, Rome, and elsewhere. The number of pupils educated by him was such that Alexandria and Rome alone contained at one time no less than 40 celebrated philologists who had been brought up in his academy. He was also the preceptor of Ptolemy Epiphanes and Ptolemy Physcon. In his old age he left Egypt and went to Cyprus in consequence of the injustice he had experienced at the hands of Physcon. There, being afflicted with the dropsy and weary with suffering, he put an end to his life by voluntary starvation in the 72d year of his age. He is frequently called by ancient authors the "prince of grammarians." Criticism, in the widest sense of that term, as understood in antiquity, was the great business of his life. To purge the text of each of the great poets of Greece from the interpolations and corruptions which had crept into it, to illustrate its obscurities, to draw attention to its beauties and perfections—this was the task to which his great abilities and acquirements were devoted. But it was on the text of Homer that he especially delighted to meditate and labor, and such was the extraordinary acumen displayed by him in surmising its true readings, and detecting its spurious ones, that Panætius, the Stoic, pronounced him a "diviner," and the greatest modern critics aspire at nothing more than bringing back the text of the poet to that state of purity in which Aristarchus left it. Aristarchus is said to have written 800 commentaries, but nothing of all his writings remain save those scattered unconnected fragments which the scholiasts have preserved.

II. Of Samos, flourished about 400 B. C., and was one of the first who held that the earth revolves around the sun, for which opinion

some thought him guilty of impiety. The only work of his extant, is a treatise on the distance and magnitude of the sun and moon, of which a French translation was published in 1810.

ARISTIDES, I. An Athenian, the son of Lysimachus, and a contemporary of Themistocles. In early childhood he exhibited calmness, resolution, and a contempt of every thing dishonorable. His admiration of the institutes of Lycurgus gave his opinions a bias in favor of oligarchy. Themistocles, on the contrary, belonged to the democratic party. Hence, between these two distinguished men existed a life-long opposition on all measures of public policy. Aristides is said to have remarked on one occasion that the Athenian commonwealth would never prosper until both were thrown into prison.—At Marathon Aristides was second in command, and set the example of resigning his day of command in favor of Miltiades. Being left in charge of the Persian camp, he maintained his integrity by bringing all the spoils to the public treasury. Soon after, by the intrigues of his rival Themistocles, he was ostracized on the pretext that he was acquiring an influence dangerous in a democracy. He employed the years of his exile in endeavoring to stir up the Grecian cities to resist the Persians, at that time preparing for a second invasion. He sought an interview with Themistocles before the battle of Salamis, concerted with him the plan of that engagement, and gave him his hearty support. The success of the Greeks at Plataea was chiefly owing to his courage and watchfulness. A disagreement of the allies concerning the honor of that day having been referred to him for decision, he surrendered the claim of his countrymen in favor of the Plataeans, and persuaded the Lacedæmonians to follow his example. The Persian war continuing, he, with Cimon, the son of Miltiades, was sent at the head of the Athenian forces to join the confederate army. The mildness and urbanity of his deportment, contrasted with the arrogance of the Spartan commander Pausanias, so charmed the rest of the allies that a confederation of the Ionian states was formed under the hegemony of Athens. The Greeks had so high an opinion of his integrity, that he was appointed to assess the expenses of the war on the several states—a commission which he executed to the satisfaction of all. When Themistocles fell under suspicion he did not join in the prosecution; and after the banishment of his rival he always spoke of him with admiration and respect. Aristides died 488 B. C., not leaving the means of defraying his funeral expenses. He was buried at the public cost; his daughters received dowries out of the public treasury, and a landed estate was bestowed on his son.—So conspicuous was the purity and rectitude of his character, that in his lifetime he was called "the Just." When a verse of Æschylus was first uttered in the theatre, describing in vigorous terms the character of an honest man, every eye is said to have turned involuntarily

to Aristides. When Themistocles stated in the public assembly that he had devised a measure of great advantage to the state, but of such a nature that it could not be made public, he was directed to disclose it to Aristides. It was a proposition to secure the naval supremacy of Athens by burning the ships of her allies. Aristides reported to the people that nothing could be more advantageous, and, at the same time, more unjust; and the proposition was not entertained. His exploits were less brilliant than those of Themistocles. He did not destroy great fleets, nor display that military genius on land, which first disclosed an art of war. But his virtues have secured for him as wide and a purer fame. II. P. *ÆLUS*, a Greek rhetorician, born at Hadrianopolis, in Bithynia, A. D. 117 or 129, died A. D. 189. He was the son of Eudæmon, a priest of Zeus, and applied himself with unrivalled zeal, under various teachers, to the study of eloquence and poetry. He left admirers of his talents in every place where he studied, and several towns raised statues in his honor, one of which, representing him in a sitting attitude, was discovered in the 16th century, and is now contained in the museum of the Vatican. After traveling through the countries which border the Mediterranean, he took up his abode at Smyrna, and his countrymen, in their enthusiasm, likened him to Demosthenes. He was an associate and admirer of Marcus Aurelius, and when in 178 Smyrna was almost wholly destroyed by an earthquake, he addressed to that emperor a letter describing the catastrophe, and picturing the misfortunes of the inhabitants. The emperor assisted in rebuilding the city, and the Smyrneans testified their gratitude to Aristides by naming him the founder of the town, and raising to him a bronze statue in the agora. He held, until his death, the title of priest of *Æsculapius*. Fifty-five of his orations and declamations have been preserved, consisting of eulogies on various divinities, panegyrics on towns, and treatises on rhetorical topics. They are marked by the excessive brilliancy and stateliness of style which distinguished the rhetoricians of his age, but Aristides far surpassed most of his contemporaries in vigor of thought, and his study of the ancients saved him from the poor witticisms and shallow plays upon words with which many of his associates sought to produce a momentary effect. Six of his pieces, entitled the "Sacred Discourses," are interesting, in connection with the history of animal magnetism. They describe a singular malady, not unlike somnambulism, and the cures of it wrought by the counsels of the god *Æsculapius*. The disciples of modern mesmerism find in the descriptions by Aristides something similar to the later mesmeric phenomena. His works also contain valuable illustrations of history and antiquities, and many fragments from other works now lost. The latest and best complete edition of them is that of Dindorf, in 8 volumes, Leipzig,

1829. III. OF *THERES*, a Greek painter, flourished from about 860 to 830 B. C. He is said by Pliny to have been a little older than his contemporary, Apelles, and to have been the first who knew how to express upon the countenance the passions and movements of the soul. The most celebrated of his paintings represented a mother mortally wounded in the bosom, and fearing lest her child, if she gave it suck, should draw blood instead of milk. This picture was so much admired by Alexander that he removed it to his capital. He painted a battle between the Greeks and Persians, which contained more than 100 figures, and at the time of the Roman conquest, the consul Mummius, discovering the high price set upon it, and wholly ignorant of the value of a masterpiece, seized it as a talisman, and sent it to Rome. It was placed in the temple of Ceres, and was the first foreign painting exposed to the view of the yet rude Romans. Aristides was also famous for his pictures of Grecian hetærae, and is said to have invented encaustic painting in wax, afterward carried to perfection by Praxiteles.

ARISTIPPUS, a native of Cyrene, whence his philosophy was called Cyrenaic, and the disciple of Socrates, flourished 880 B. C. His mode of life differed greatly from that of his master, for he was luxurious, sensual, and avaricious. The numerous anecdotes of him, however, do not represent him so much the slave of his passions as one who prided himself on extracting pleasure from prosperity and adversity alike. When reproached for his love of bodily indulgence, he said that the shame consisted, not in the encouragement of it, but in not being able to give it up. His conversation was rendered agreeable by continued flashes of wit. Dionysius having asked him how it happened that the philosophers were always besieging the doors of the great, whereas the great never went to the philosophers, he answered, "Because the physicians usually go to the sick." Being rallied on his intercourse with the wanton Laïs, he said, "It is true that I possess her, but she possesses not me." One bragging that he had read a great deal, Aristippus told him that it was no sign of health to eat more than one can digest. Dionysius having assigned him the lowest place at table he said, "You wish to dignify the seat." Under the most bitter insults and reproaches he maintained perfect imperturbability of temper. He is said to have incurred the dislike of Plato and Xenophon, who accordingly, in their works, speak of him slightly. His doctrine was reduced to a system by his grandson, Aristippus the younger. The Cyrenaic philosophy pronounces pleasure the chief good, and pain the chief evil,—the former a moderate, the latter a violent motion of the soul. Pleasures differ only in their degree of purity. Actions are to be judged good or bad by their results; and in forming a judgment the only authorities are law and custom. Whatever conduces to pleasure is accounted

virtue; but virtue is regarded as a quality of mind rather than of the body, since bodily pleasure is valued for the sake of the mental state produced by it. This system in some respects anticipated the philosophy of Locke and Hume; for its advocates held that the senses are the only avenues of knowledge. At the same time they asserted, that a subject becomes cognizant of objects only through the media of impressions, that the only existences are states of mind, and that man is the measure of all things,—doctrines not unlike some of the doctrines of modern idealism.

ARISTOBULUS. I. An Alexandrian Jew, who lived in the 2d century, possessed some knowledge of the Aristotelian philosophy, but made the Mosaic law his chief study. In his commentaries upon the Pentateuch, composed in the purest Greek, he undertook to prove that the Grecian poets, historians, and philosophers, were acquainted with the sacred writings, and in the habit of borrowing largely from them. In support of this theory, he forged numerous passages, ostensibly from profane authors, with such art as to deceive Greek writers and some of the fathers of the church. II. An officer of Alexander's army, who at the age of 84 years, wrote a history of all his campaigns, which Arrian took for his guide in editing the *Anabasis*. Plutarch, Lucian, and Athenæus, praise his accuracy.

ARISTOCRACY (Gr. *aristokratia*, the rule of the best). In the higher philosophic conception, the government of society by the best amounts almost to an ideal toward which humanity has aspired from its cradle. But, as a positive fact, aristocracy is the rule of the comparatively few over the many; and even if originally animated by the noblest purpose, it appears in history, almost from the beginning, as a mere hereditary privilege. It is established by the founders of communities, cities, and states. Having gained power over the subdued and conquered mass of men, or over those who have voluntarily gathered around them, they consider themselves the best, and are likewise so considered by those under their control. Their superior mental or physical ability, real or supposed, is believed to be transmitted by blood, and thus the power of the father is maintained in his descendants by custom, use, or force. Aristocracy reaches back almost to the first formation of society. Legend, tradition, and positive history, exhibit it in the most ancient nations and states, as, for instance, among the Aryans and Assyrians, under both kings and chiefs, it being coexistent with royalty, and not intrinsically inimical thereto. China, however, is an exception to the rule, having had no aristocracy until the Mantchoo conquest. The Persians, although all free, had a class of nobles, and among these there were aristocratic families surrounding the king, and partly sharing his power. The Greek aristocracy were wont to attribute their origin to the gods, demi-gods, and heroes, whom mythical and religious tradi-

tion surrounded with public reverence, and to their companions who had shared their labors, and assisted them in raising cities and states. As a matter of fact, these persons were very probably the Dardans and Hellenes, who conquered and organized the aboriginal inhabitants of Greece.—The Roman patricians were descended from the roving predatory associates of Romulus, that is, historically speaking, from the first founders of the city, who alone formed the Roman body politic, and enjoyed the rights of citizenship. At first they shared power with the kings, but on the expulsion of the latter, monopolized it for themselves. The aristocracies of all nations, ancient as well as modern, have always boasted of the purity of their blood, and to maintain it have avoided all but aristocratic intermarriages. Thus it was in Greece; and the Roman patricians had a special rite to consecrate the union of parties of pure lineage. Among the ancients, aristocracy was likewise based on the proprietorship of land to which, along with general civil rights, special privileges were attached. The policy of sovereign aristocracies has generally been ambitious and conquering; their domestic rule, when not contested by other classes of the population, often equitable, and not worse than that of royalty. But they have ever been most jealous in preserving sovereignty for themselves. They have defended it to the utmost, not hesitating at murder, cruelty, and civil war, when necessary for that purpose. The struggles of aristocracy for power, form the most prominent feature in the history of the Greek republics, and above all of Athens, and the Thebans. The same is true of the republic of Rome. Aristocratic families existed among the Germans previous to their irruption into the Roman world, and among the Scandinavians. The Goths, while yet heathens, and confined to the country of the Danube, had a civil and sacerdotal aristocracy, with considerable political power, under their kings. History calls this aristocracy *pilefori*, or those who kept their heads covered at sacrifices, and in the presence of the monarch. This aristocracy was continued in Spain after its conquest by the Visigoths, and from it the Spanish grandees derive the privilege of remaining covered in the presence of royalty. When the various German tribes conquered the Roman world, and established their dominion over it, giving a feudal organization to society, aristocracy obtained a firm basis in the soil. The feudal aristocracy, with extensive political power, became superior to the rest of the conquerors, and even to the mass of the nobility, who were originally its equals. This aristocracy became distinct by its powers and privileges, which were expressed in its titles, as dukes, marquises, counts, and barons. It was early established among all the German tribes, as the Angles, Franks, Lombards, and Saxons, out of and within Germany, and soon raised itself above the body of

the nobility, in the whole of feudal Europe. To some extent it preserved its rights, even after the overthrow of feudality, and the establishment of absolute royal power. It was in England, however, that the feudal aristocracy reached the highest and most complete development as a strongly cemented body, with predominant political power and influence. In that kingdom, in fact, it became the only form of nobility, whereas, all over the continent, the nobility preserved its existence along with the feudal and political aristocracy. Out of the political organization of the English aristocracy was finally evolved the constitutional system of government. Among the sovereign aristocracies of the Christian era, the most eminent for the wisdom of their rule were those of the republics of Venice and Berne in Switzerland, of which the latter was highly admired by Montesquieu. The great French revolution gave the death-blow to aristocracy as a conception, power, or fact. Absolute royal governments, although propped up by aristocracies, have likewise incessantly endeavored to reduce them to insignificance. At the present day, hereditary aristocracy is on the wane all over the world. Even in England, it has lost force as an idea, while almost everywhere else it is deprived of its ancient preponderance. The most absolute contrast to hereditary aristocracy is democracy. The principal political difference between the two now consists in the one being founded on rights of property, the other on personal rights. Modern times have produced a kind of sham aristocracy, which derives its standing not from birth, power, higher mental qualifications, or real political influence, but from wealth, and the date of its acquisition. This mock aristocracy is a weed which springs up especially in large commercial communities, and in new republics.

ARISTOGITON, an Athenian, commonly reckoned among the martyrs of liberty. He had conceived a shameful passion for Harmodius, a beautiful youth, in which Hipparchus, one of the Pisistratidæ, was his rival. Stung by jealousy, in conjunction with Harmodius and others, he formed a conspiracy to destroy the tyrant, during the Panathenæic festival, at which the conspirators were present, with their swords concealed in garlands of myrtle. The plot succeeded; but Harmodius was slain by the guards, and Aristogiton secured 514 B. C. When subjected to torture by Hippias, the brother of Hipparchus, he named as his accomplices the best friends of the tyrant, who were immediately put to death. Three years after, on the expulsion of Hippias, the Athenians, from motives of policy, paid distinguished honors to Harmodius and Aristogiton, erecting statues and singing hymns to their memory, and decreeing that no slave should bear their names. To the mistress of Harmodius who refused to disclose the names of the conspirators, was erected a tongueless statue, to commemorate the victory gained by a woman over her love of talking.

ARISTOMENES, a Messenian, under whose lead his countrymen unsuccessfully strove to shake off the Spartan yoke 682 B. C. The 1st of 3 battles, which were fought in 3 successive years, was indecisive, the 2d a signal victory by the Messenians, the 3d an equally signal defeat, through the treachery of the king of Arcadia. In the course of the war Aristomenes surprised fortified towns in the heart of Lacedæmon, and one night hung his shield in the temple of Athena, in Sparta itself. Three times he offered to Zeus the *Hekatomphonia*—the sacrifice of one who had slain with his own hands 100 enemies in battle. Two of the 3 times that he was taken prisoner, he escaped before reaching Sparta; the 3d time he was thrown with 50 of his companions into the Keadas—a chasm in Sparta, used for the punishment of malefactors. The others were killed by the fall; Aristomenes waited until the 3d day, when, espying a fox among the dead bodies, he seized him by the tail, and followed him to his place of exit, which he enlarged sufficiently to creep out himself. To the surprise of all, he appeared at Ira, a fortified mountain, where the whole Messenian force was concentrated. After holding out for 11 years, Ira was betrayed, but its defenders forced their way out and took refuge in various parts of Greece. Aristomenes went to Rhodes, where he died.

ARISTOPHANES, the great comic writer of classic antiquity. It is singular that a man of such celebrity, living in a period of Greek history than which none is better known nor more distinctly historical, a contemporary of all the great men of Athens, with whose deeds, whose fame, whose writings, and almost whose persons we are most familiar, as Sophocles, Euripides, Alcibiades, Cleon, Thucydides, and Socrates, should have transmitted to us so few memorials—and those so doubtful—of his distinguished career. It is not even certainly known of what country he was a native, where he was born, or where he died. That he was an Athenian citizen is clear, but whether native or naturalized remains in doubt, although it seems most probable that he was the son of one Philippus, an inhabitant of Ægina, and that, therefore, he was, only by adoption, a citizen of Athens. The date of his birth has been fixed, by approximation, at 460 B. C., and that of his death at 880 B. C., which would assume him to have lived to the age of 80 years. At a very early date of his dramatic career Aristophanes seems to have turned his attention to politics, and to have directed all his efforts of satire and pleasantry to the local and political occurrences of the day; for his second recorded drama, the "Babylonians," was aimed against the demagogue Cleon, as was also his *Equites*, in a far greater and more virulent degree; and that, too, at a time when his extraordinary and unwarranted success at Sphacteria had gained him such popularity with the mob that to attack him at all was a matter not to be thought of without danger. Danger, however, did not deter

the comic poet from doing as he had promised to do, when, in the "Acharnians," he pledged himself at some time or other to "cut him into sole-leather;" for when no actor could be found to undertake the perilous office of representing the insolent demagogue, and no artist dared model a mask of his features, the poet himself proceeded to play the part, and appeared in the character, with his face besmeared with the dregs of wine, as had been the wont of the first rude actors, in the days of Thespia. Of the comedies of Aristophanes it is excessively difficult for a modern reader to form any thing approaching to an accurate judgment. His wit is expended on topics and involved in allusions to events so purely local, locally political and ephemeral, that it requires the closest acquaintance with the occurrences and characters of the day, the temper of the people, and the every-day circumstances of Athenian life, to enable a person to appreciate and understand, much more to enjoy his wit or humor. Indeed, his very wit is so inextricably mixed up and interwoven with buffoonery, coarseness, and positive filth, that it is difficult, if not impossible, for a person at the present day, of refined tastes and decent manners, to find any thing, apart from the purity of the style, the dexterity displayed in the management of the language, "in all its shades of difference," as Professor Anthon has well expressed it, "from the most familiar dialogue to the lofty flights of dithyrambic song," which will not disgust, rather than amuse him. It must be remembered, however, that what we now call elegance, decency, and delicacy, were things utterly unknown and incomprehensible to the ancients, whether of Greece or Rome—that the foulest things were habitually spoken of in public, by their broadest, plainest, and coarsest names, without hesitation on the part of the speaker or disapprobation on that of the hearers. The audiences at the theatres were men only, for women among the ancient Greeks had little more personal freedom than they now have among the Turks, and were restricted as closely to the *gynæceum* as are the ladies of the East to the limits of a Moslem harem. This restraint, therefore, if in those days it would have been a restraint, which may be doubted, was not felt either by the comic writer or the comic actor, holding him back from flights of grossness or buffoonery, which, while delighting the groundlings, would be sure to make the judicious grieve, if there were those then frequenters of the performances of the Attic drama who would be called, in that sense, judicious. Nor was it only that the audiences of Athens were entirely composed of men, but that they were composed of all the men of all classes; that they were audiences made up of that very same fierce democracy who banished Aristides and murdered Socrates and Phocion, whose applause he had to win, and whose attention to fix and interest in the subjects which he desired to impress on them, by something akin to their natures, and congenial to their tempers

and temperaments. He certainly cannot be said to have pandered to the evil tastes and depraved inclinations of the people, even though he did condescend to catch their laughter by obscenity, buffoonery, and coarse, immoral jesting; for the boldness with which he lashed their political vices, held up the mirror displaying their own rank corruptions to their very faces, and pulled down and broke to pieces their favorite idols, refutes the charge of his flattering their prejudices or stimulating their passions in order to gain their voices. It is more probable that, living in a coarse age, his own mind actually partook of the coarseness which was a part of its nature; as it was a part of that of one whom he not a little resembles, the great satirist of the vices of the middle ages, the French Rabelais. For the most part, the men whom he most severely lashes are the very same—sophists, demagogues, and corrupt politicians—whom Thucydides condemns as the most destructive enemies of the state and misleaders of the people; and, in general, the things which he holds up to ridicule or reproach are things worthy of condemnation, on every score of morality and reason, such as the insolent ignorance and self-arrogating impudence of the base and cowardly Cleon; the scarcely concealed impiety of the misogynist and atheist, Euripides; the shallow impertinences, casuistry, and irreligion of the sophists; and last, not least, the corrupt jurisprudence of the people itself, who listened with singular forbearance and good-temper to his violent diatribes and pungent satires on their own proceedings, and the manner of their own lives. The matter which has been the most severely charged against Aristophanes is his bringing Socrates prominently forward as a subject of ridicule in his comedy of the "Clouds," a play especially directed against the sophists, of whom he erroneously, if not with intentional falsehood, represents that philosopher as the head and leader. It has been asserted that this introduction of the philosopher to the corrupt Athenian audience, in a ridiculous character, and as a subject for scorn and loud laughter, was intended as a direct measure for bringing him into popular disrepute and disfavor, preliminary to procuring his accusation and compassing his judicial murder. Not, however, to dwell on the other obvious inducements which would prompt a comic poet of no very nice perceptions or delicate feelings of propriety to bring upon the stage a celebrity and notoriety so generally known as Socrates—known, too, it must be said, for his ludicrous and grotesque ugliness of person, for his singular fits of absence and distraction, and for certain quaint vulgarities, closely bordering on affectation and charlatanry, and, if not actually such, at least the consequences and symptoms of a singular eccentricity—this accusation and the deliberate charge that he was acting in collusion with Melitus, the future accuser of the philosopher, are at once disposed of by the mention of a single fact, that 22 years elapsed between the repre-

sensation of the "Clouds" and the trial, condemnation, and execution of "Athens' best and wisest." It is also evident that Socrates did not regard Aristophanes either as his enemy or as a dangerous and disreputable character, since it is on record that he often met the comedian after his own appearance among the clouds in a basket, on terms of friendship, upon social and festive occasions; and, still more markedly, since Plato, the pupil, admirer, follower, and posthumous eulogist of the murdered sage, speaks of Aristophanes in terms of the highest praise, declaring "the Graces to have selected his mind as their constant habitation," habitually reading his works, and, above all, recommending to the elder Dionysius, as worthy of his perusal and study, with a view to "learning to know the state of Athens," this very play of the "Clouds," which is pretended to have been the first move in the conspiracy against the master of the poet's eulogist. Nor is this testimony of Plato's conclusive only in relation to the charge against the comedian as an accessory to the ruin of the philosopher, but, taken in connection with the familiarity of Socrates, goes far to show the real nature of his alleged coarseness and buffoonery, and the light in which they were regarded by the first men of the day and the country. They were, in a word, either regarded as legitimate means for producing ends consonant to patriotism, reason, and true morality, or, what is far more probable, they were not looked upon as vulgarity, buffoonery, and filth at all, in that corrupt and obscenely thinking and speaking age, but as somewhat broad and free-spoken wit and humor, just as words written or spoken in the court of King Charles II. would have elicited general applause from the courtiers, the utterance of which would now consign the utterer to lifelong banishment from the society of decent people. Aristophanes was an industrious and voluminous composer, having published above 60 comedies, and gained many prizes. Eleven of his comedies are still extant: "The Acharnians," "The Knights," "The Clouds," "The Wasps," "The Peace," "The Birds," "The Women celebrating the Festival of Ceres," "The Lysistrata," "The Frogs," "The Females met in Assembly," and "The Plutus"—the last, a middle comedy, as it is termed by the grammarians, attacking general, rather than peculiar, vice, without the introduction of real characters or of much direct personality. The purity of the style of Aristophanes is, it may be said with too much justice, the only thing that is pure about his works; still they cannot be dispensed with by the student of Greek letters, since probably from no other existing sources can he learn so much of the domestic life, the social manners, the working of the polity, and the general tone of thought in Athens, as from these somewhat more than ribald compositions, the wit of which will hardly charm the modern reader. The best editions of Aristophanes are that of Kuster, that of Brunek, and that of In-

vernizzi, continued by Beck and Dindorf, beside some editions of separate plays of rare excellence by Mitchell, who has also ably translated some of the number, and by Prof. Felton of Harvard university.

ARISTOTLE, perhaps the greatest philosopher of ancient times, born 384 B. C., at Stagira, or Stagirus, as it is written by some ancient authors, a Greek colony of Macedonia, near the mouth of the Strymon river, whence his appellation of "the Stagirite." Both his father Nichomachus, the private physician of king Amyntas, who was the grandfather of Alexander the Great, and his mother Phæstia, seem to have belonged to the Macedonian nobility. His history offers so many mythical, fabulous, and quite uncertain points, that we refrain from giving in this sketch of his life any thing but the facts generally admitted by classical scholars. He studied for a short time at Atarnus, in Asia Minor, and at 17 years of age went to pursue his studies in Athens, where he resided for 20 years. He was a pupil of Plato, whom he sincerely admired, though opposed to him in philosophy. Plato was accustomed to call him, on account of his enthusiasm for knowledge and his restless industry, the "intellect of his school." About 348 B. C., Philip of Macedonia made him the teacher of his son Alexander, at that time 13 years old. His influence on this gifted youth and king was for many years very great and salutary, and Philip rebuilt, at his request, the city of Stagira, which had been destroyed, and erected there, in a pleasant grove, a school called Nymphæum, where Aristotle was to teach. Alexander was very grateful to him, and after the conquest of the Persian kingdom presented him with 800 talents, or nearly a million of dollars. He also sent to him whatever he discovered on his marches that was unknown in Greece, such as plants and animals for scientific examination, and is said even to have been accompanied by him in several of his expeditions. Aristotle returned to Athens, not before 331 B. C., whither he brought his scientific collections, and established a new school of philosophy in the Lyceum, a gymnasium near the city. In the forenoon he instructed his intimate pupils in a philosophical way, which lectures were called esoteric, or strictly philosophical and intimate; and in the evening he taught a large popular circle, in a more common-sense way, about plainer matters, which were called exoteric or public lectures. His philosophical school is sometimes called the Peripatetic, because he taught while walking up and down, and in the time of Plutarch the shady paths of the grove of the Lyceum were still pointed out to the traveller. His friendly relations with Alexander were at length interrupted, perhaps on account of admonitions which he sent to that conqueror when, in his later years, he precipitated himself into a dissolute and any thing but philosophic life. Yet the Athenians, bent on rebellion, suspected him of partisanship for Macedonia, and being unable

to bring against his spotless life any political charge, they accused him of impiety, and thus forced him to flee to Chalcis, on the island of Eubœa. There he died in 322 B. C., it is not known of what disease. Only a part of his numerous writings on almost every branch of science and art, were then published; the remainder had an uncertain fate, many of them being lost, and many published only in the first centuries of the Christian era. The most important of them bear the following titles: "Organon," or "Logic," "Rhetoric," "Poetica," "Ethics," "Politics," "History of Animals," "Physics," "Metaphysics," "Psychology," and "Meteorology." His writings on mathematics, economy, and history are lost, as well as his letters, and a work called *Politiciæ*, which contained 158 ancient state constitutions and legislations. Many books bearing his name are spurious, and it is only in the present century, since careful and learned criticism has been brought to bear upon his works, that the spurious begin to be sifted from the genuine. His style is difficult to understand, not only because of the intricacy of the subjects treated by him, but also on account of the technical terms entirely his own, the meaning of which must be learned by a careful comparison of the different relations in which they occur. This is the reason why he has so long been misunderstood. No other philosopher has exerted so large an influence on so many centuries, and on the ideas of so many nations, as Aristotle. His merits as a metaphysical thinker may be variously estimated, but his performances in natural science, which he first created, and his method of philosophy, constitute his greatness. He was the first careful observer, anatomical dissector, and psychological describer of animals. He first divided the animal kingdom into classes, described a great many animals before unknown to the scientific world, came near discovering the circulation of the blood, discriminated between the several faculties, the nourishing, feeling, concupiscent, moving, and reasonable powers of animal organism, and attempted to explain the origin of these powers within the body, and built his moral and political philosophy on the peculiarities of human organization—a course to which at last Bacon, Spinoza, Hegel, and many natural philosophers of our days, have been compelled to return. His philosophical method and peculiarity consist in what is commonly called the principle of experience, that is to say, the principle that all our thinking must be founded on the observation of facts. We must not arrange systems of ideas which contradict physical certainties, but must adapt and conform our ideas to the facts that have been critically established. By following this principle, we may safely expect to arrive at the truth or reality underlying all appearances, and to become acquainted with the very substance and original causes of things, provided we think and conclude logically. Logic is therefore the fundamental science. We cannot even, without

the strict test of logic, observe facts in their proper light, discriminate between the essential and accidental features of things, or escape self-deception and false views. We must, therefore, before all things, observe the different ways in which our mind forms its first notions, and its various and successive conclusions. We must study the meanings of language, and its manifold ways of expressing relations, and thus establish the laws of correct reasoning. Aristotle thus became the father of the science of logic, and the principles of logic which he laid down have never been superseded. It is acknowledged by Kant and Hegel, the two deepest thinkers of Germany, that from the time of Aristotle to their own age, logic had made no progress. He invented the categories, or fundamental forms of thought, universal expressions for the ever-changing relations of things, and limited their number to 10; and he devised the so-called "syllogistic," or science to form correct conclusions. He likewise became the father of modern psychology, showing how the mind creates its speculative methods and general notions; and though we cannot prove their correspondence with the reality, because there is no direct proof for things which transcend our senses and observation, that yet we are always compelled to recur to these general notions and take them for indispensable forms of thinking, if we will think at all. Thus, for example, we form a notion of what is expressed by the word "all," and though we never see a thing observe all things of a certain class, or much less all things together, yet we must operate in thinking with this notion of totality, or give up thinking. Correct logical reasonings built upon this category may not be susceptible of demonstration, but we cannot do without them; and so of all categories. Every science must, therefore, according to Aristotle, have a fundamental principle, which need not, and cannot be logically proved because it is in itself certain, and accepted as manifest truth by every sane person; and upon this principle every science must be constructed. The great difference between Aristotle and all his predecessors in philosophy is, that the latter began with some principle, not in itself clear and generally accepted, but invented by the imagination; thus Heraclitus began with "Fire is the substance of every thing," and "Every thing flows;" and Pythagoras with "The numerical proportions are the real substance." Aristotle, on the contrary, begins all sciences with the established facts of experience, with principles generally acknowledged, and proceeds by logic. The special difference between Aristotle and Plato, his rival for centuries in the favor of the philosophical world, is that Plato states a qualism of material objects and mental ideas; he affirms that things appearing are only the soulless shadows, the imperfect images, the perishable forms of the ideas as they exist in the divine mind, and are seen by the inner sense, the spiritual eye, and reasoning power of man.

Aristotle was of opinion that the substance of things is in and not behind the things—that it belongs not to the immaterial world, but forms whatever is permanent in the flux of outward appearances. Thus he first discriminated between the substance of things and their accidental peculiarities, and created the philosophical notions of "matter," the stuff, shapeless and without any quality, which underlies all varieties of things, and "form," which is the vital principle of all things, their "energy," causing all their variations or developments toward their appropriate perfection or aim, and which is sometimes called by him *entelecheia*. The matter is no real thing, but only a possible one; it becomes the mother of every thing by the creative power of the form, giving it actual but ever-changing existence in the things of the world. Change is, therefore, only a realization of what was before possible. Herein Aristotle's views somewhat resemble the modern idea of the inherent adaptation of every thing to attain its reasonable aim, only that he is not decided as to the nature of contingency or chance. The driving energy which he ascribes to every existing form, is what we call its soul or life. He has, further, established the philosophical notions of "space" and "time," and shown their connection with matter, while he first furnished the world with what is commonly called the cosmological argument for the existence of God. He states it thus: Although every single movement and existence in the world has a finite cause, and every such finite cause another finite cause back of it, yet back of this infinite series of finite causes there must be an infinite immaterial being, a first something, unmoved, all-moving, pure energy, absolute reason, God. The philosophy of later ages has labored much to show that this argument is not sufficient to compel the reason. In psychology and anthropology, Aristotle is the author of the theory of different powers of the soul, of distinct feeling, willing, reasoning, and moving powers or faculties—a theory which prevailed until called in question by some modern psychologists. The reasoning power is regarded by Aristotle not, as we should expect, as a product of the body, but as foreign to its natural organization, bestowed on it from outside, and as perfect only after its separation from the body by death—a view which has made Aristotle a favorite with many Christian theologians. In this single respect he harmonizes with Plato. His ethics and politics are sublime. Proceeding from the principle that whatever is to be the goal and highest good of humanity must not depend on casualties and ever-changing minor circumstances, but must be certain in itself, and impart to every other good its value, he maintains that the *eudaimonia*, or highest possible pleasure which is conceivable for man, is derived only from the perfect satisfaction of those faculties which distinguish him from the beasts, that is, of the reasoning powers. The dominion of the

reason over the passions, the strong energy of the will in aspiring to the highest good, are, according to Aristotle, of not so high a value as the thinking energy itself—a view which has found also many modern champions. Aristotle's political and social opinions, high-toned as they are, and founded in moral philosophy, display a treasure of wisdom and experience astonishing in his age, and merit, as they have received, the best modern sympathies. Of his earliest pupils and followers, none but Theophrastus, and he not strictly a philosopher, is worth mentioning. The age after Aristotle's death was not favorable to purely speculative philosophy, most thinking men forming for themselves an individual system of thought culled from the different schools. For 8 centuries after his death Stoicism and Epicureanism, of whose specialities we are too little informed, took the place of his philosophy in the favor of the educated world; and these were succeeded by Neo-Platonism. Nothing was done in his line of thinking, until, about 150 years after Christ, a school was founded at Alexandria to comment upon and grammatically explain the writings of Plato and Aristotle. This school endeavored to beget an enthusiasm for speculative philosophy among the educated classes, and to revive classical heathenism in opposition to Christianity. The philosophy of Aristotle was thus rendered obnoxious to the fathers of the church, and only a few sublime minds, like Boethius, ventured to defend his views. In still later times, and up to the 11th century, Aristotle was almost unknown to the Christian world, but became a favorite with the Arabians, the most learned and progressive men of the 8th, 9th, 10th, and 11th centuries. They began with translations of his writings on natural science and medicine, then studied and commented upon his other works, and were doubtless the means of saving some portions of them to posterity. Through the Arabians, the scholastic writers of the 11th century made acquaintance with his "physics" and "metaphysics," though by means of very imperfect translations; his "logic" they had, though not extensively, known before. From that time Aristotle, though sometimes disparaged as a heretic, remained for 4 centuries the authority of the Christian world in all matters not strictly pertaining to dogmas. In the 11th century the dispute between the Nominalists and Realists began to divide learned theologians; the Realists asserting with Plato that our general notions, called *universalia*, are the substance of things, that our ideas answer not only to the reality of objects, but contain their soul and life; the Nominalists, in the name of Aristotle, maintaining that these general notions are mere abstractions, inventions of the brain, not expressing the real substance of things. From the exposition that we have given, it appears that this pretended Aristotelianism was a misunderstanding of Aristotle's philosophy, which though it admits on the one hand that our general notions cannot be demonstrated to express the

full substance of things, yet at the same time asserts that they are indispensable for every purpose of thinking. But what here unjustifiably bore the name and claimed the sanction of Aristotle, is, nevertheless, one of the two great contrary systems of philosophy which reach through all ages, the one asserting the possibility of entering with our mental eye into the interior and essence of nature, the other denying this and claiming for our mind only the faculty of giving ideal images of the exterior nature, whose reality is doubtful or at least impermeable. Nominalism was for the first scholastic period unsuccessful, but during the second which lasted to the reformation it was victorious. It has ever since exerted a strong influence on modern public opinion. After the restoration of classical literature in the 15th century, the writings of Aristotle were extensively published, and his philosophy better understood; and it has been further developed by Bacon, Descartes, Spinoza, and Kant. Fichte, Schelling, and Hegel opposed it, the latter, however, adopting many of its ideas. It is, however, not so much by his philosophical system that Aristotle has wielded his enormous influence, especially as this begins only at present to be fully understood and justly appreciated, as by his logical inventions, and his method of philosophy in general. He has more than any other philosopher set the world to thinking logically, to treating science and art systematically, to banishing from the domain of science the rampant and arbitrary action of fantasy, to observing coolly before venturing to systematize, and to loving truth for its own sake. It is true that under the shield of his name, particularly in the middle ages, many ingenious but useless subtleties were passed off for logic and dialectics, and the nicest distinctions in words accepted for conscientious accuracy; but this was not his fault. While during that mediæval period, philosophy was all over the world regarded as the obedient handmaid of theology, and discarded publicly whenever at war with her, the opinion could not be avoided that there were many things true in the philosophy of Aristotle which were not true in theology. Thus he served to preserve the critical and scientific spirit through a long age of desperate darkness, which, perhaps, but for him, would have been greatly prolonged. The best books on the contents, spirit, and bearings of the writings of Aristotle, are Stahr's *Aristotelica*, 2 vols., Halle, 1880, and Franz Biese's *Philosophie des Aristoteles*, 2 vols., Berlin, 1885-'82. The best complete edition of Aristotle is that of the academy of sciences at Berlin, by Immanuel Bekker, 4 vols., Berlin, 1881, not yet completed, with Latin translations and extracts from the old commentaries.

ARISTOXENUS, a Greek writer on philosophy and music, born at Tarentum, in Italy, flourished 350 years B. C. He was, like his master, Aristotle, a man of great universality of intellect, and published not less than 450 works

on all imaginable subjects. All these works are lost excepting his *Ἀρμονία στοιχεῖα* (Principles of Harmony). This work was published in Latin at Leyden in 1562 by Gogarinus, and in 1616 in Greek by Meursius, and subsequently inserted by Meibome in the *Antiquæ musicæ auctores* (Amsterdam, 1652, 2 vols. 4to). Aristoxenus's theories of music were opposed to those of Pythagoras, who made music dependent upon mathematics, while Aristoxenus admitted only the test of the ear.

ARITHMETIC (Gr. *ἀριθμῆναι*, to count), the simplest and most ancient mathematical art, treating of numbers. The earliest history of the art is lost, but the science began, as all other sciences, with the Greeks, who called the science arithmetic, and gave the art the name of reckoning (*λογιστική*). Pythagoras, Archimedes, Apollonius, Pappus, and Ptolemy, brought the Greek arithmetic to a high state of perfection. It was, however, deficient in using letters for signs of number, and in having no mark for zero. The Indian method was introduced into Europe by the Arabs in the 14th century, and diffused over the continent by means of almanacs. It was not until the 16th century that it had assumed its modern form, and come into general use among the learned. Still another century elapsed before the common people were acquainted with this art, which now occupies so large a space in every school. Arithmetic uses only the 9 Arabic or Indian digits and a zero cipher. The introduction of a "naught," or zero cipher, constitutes the great distinction of modern arithmetic. The decimal system probably possesses no special advantages over the duodecimal, which the Greeks used, except in the employment of a "naught." A binary arithmetic would possess some advantages over either, and the great Leibnitz was an earnest advocate of its use. In a binary system 1 would represent one, 10 two, 11 three, 100 four, 101 five, &c. Arithmetic might be called the science of numbers, and in its higher parts is called the theory of numbers, but it is taught in most of our schools simply as a mode of reckoning. It finds the sum and the difference of numbers, the product of one number multiplied by another, and the quotient of one number divided by another, and uses the modifications of these processes called extracting roots and raising powers. This is its extent as an art; but its usefulness is great, as it must always be the connecting link between higher mathematics and their purely practical applications. "Chase's Arithmetic" is a very compact elementary treatise; for further studies in the science of numbers, Gauss's *Disquisitiones Arithmeticae*, and Legendre's *Theorie des Nombres*, are standard works. Warren Colburn of Massachusetts introduced the Pestalozzian method of teaching arithmetic in this country, and his treatises on the subject have been succeeded by a great variety of excellent practical works by American authors.

ARIUS, a native of Libya, an Alexandrian

presbyter, and the leader in the Arian heresy, though not the first who entertained its peculiar doctrines. He is variously described by writers: some represent him as distinguished for beauty, grace, learning, and eloquence; while others describe him as tall, haggard, and uncombed, and with a learning more comprehensive than profound. Admitted a deacon in 306, his ordination as presbyter was deferred for 7 years on suspicion of heresy. It is said he imbibed his notions of the nature of Christ from Lucian of Antioch (311). Condemned by a synod held at Alexandria (321), he fled to the eastern church, where he vigorously spread his doctrines, giving them in all possible ways a popular form. The eastern church received him with favor, and Eusebius of Nicomedia called a council, at which the decree of the Alexandrian synod was reversed, and Arius received into communion, and reinstated in the ministry. Eusebius of Cæsarea also interested himself for Arius, and attempted to reconcile him with the Alexandrian bishop, Alexander, by a compromise between Sabellianism and the formula of Arius, both of which he rejected. Constantine, induced by the entreaties of Constantia, his sister, joined in the attempt, endeavoring to impress the bishop that the whole affair was a logomachy. But Alexander was inexorable. Constantine, therefore, had recourse to the council of Nice in 325. This council decreed consubstantiation as the orthodox faith, deposed, condemned, and banished Arius, ordered his writings to be burned, and made it a capital offence to own them. In the East, discontent with the Nicene council, began soon to be manifest, and in a short time spread itself back to Alexandria. Constantine endeavored to check it by summoning the disaffected bishops to his presence, and banishing those who would not subscribe to the anathemas of the council. He was finally induced, through the persuasions of his sister, and many in his court, who were in sympathy with Arius, to recall and hear him. Alexander, his most powerful enemy, was dead, and Athanasius was bishop of Alexandria in his stead. Arius was reconciled to Constantine, by a careful statement of his faith, and returned to his church, and Athanasius ordered to admit him as a presbyter. Athanasius refused, was deposed and banished. Arius was ordered (336) to present himself to Alexander, bishop of Constantinople, for recognition as presbyter. Alexander also refused. But Constantine was determined. A day was therefore fixed, when Arius should be recognized. Alexander prayed publicly in the service that God would interpose. The same evening Arius suddenly fell dead in the street, some say by poison, others by the magical arts of his enemies, and others that he died of a colic. The latter opinion is probably true. Thus perished the leader of the Arian heresy, leaving his name upon a movement destined to spread more rapidly after his death than before. After the death of Con-

stantine (337) the anti-Nicene feeling was constantly becoming more general. The whole court of Constantius participated in it. An anti-Nicene council was called at Antioch (341), consisting of 90 bishops, which, by a little wavering between strict Arianism and Homoiousianism, deposed and banished Athanasius (who had been recalled (338) to his bishopric), and appointed Gregory of Cappadocia in his stead. The western throne had always been opposed to the Arian party, in the person of Constantine. The eastern now began to veer in its attachment to the Arian cause. At this juncture, and after opposing councils and decrees by the two parties, a joint council was solicited from the eastern and western emperors to settle the matters in dispute. There was held the council of Sardica (347). The anti-Nicene party refused to appear, and held a council of their own at Philippopolis. Each anathematized the other; but the Nicene party triumphed. Athanasius was restored (349). Constantius now favored the Arian side of the controversy again—a council at Arles (353) sustained by another at Milan (355) again deposed Athanasius, and appointed Georgius of Cappadocia in his stead, and the Nicene party and symbolum were defeated. The Arians were now divided among themselves. The strict or high Arians, being much the smaller party, denied the Nicene doctrine of consubstantiation. The Antiochene school were the semi-Arians, or Homoiousians. The synod of Sirmium reconciled the high Arians, and the Nicene party (357), while the semi-Arians stood out. Through their vigorous opposition, the tide of feeling began again to set against the high party (359). On the death of Constantius (361), and the accession of Julian the Apostate, the Nicene party obtained the ascendancy in the West, while in the East the Arians were in temporary power. Factions in their own body (366) weakened their strength, and prepared the way for their suppression as a sect in the Roman empire (428). Though no sect has since that time been well defined as Arian, yet the doctrines of Arianism made their appearance so late as the 16th century to harass the church, as appears from the following church order in England: "That incorrigible Arians be sent to some castle in N. Wales, or Wallingford, to live on their own labor, and none other to resort to them but their keepers, until they be found to repent of their errors." (See ARIANS.)

ARIZONA, better known as the "Gadsden Purchase," is a territory of some 80,000 square miles in extent, recently purchased by the United States from the republic of Mexico for \$10,000,000, under a treaty negotiated by Mr. Gadsden, late U. S. minister to Mexico. Arizona lies between the 31st and 33d parallels of N. latitude, and is bounded on the N. by the Gila river, on the E. by the Rio Grande, which separates it from Texas, on the S. by the Mexican states of Chihuahua and Sonora, of which it was formerly a part, and on the W. by the

Colorado river of the West. The territory is of an irregular oblong form, extending some 600 miles from east to west, and averaging about 50 miles in width from north to south. At the time of the purchase this territory was attached to New Mexico, forming part of a county of that territory, under the name of *Dona Anna*, but it appears to have been much neglected by the government at Santa Fé, from which it is remote. No courts have as yet (1857) been organized for the administration of justice, and with a population of some 8,000 inhabitants, the country is entirely without a legal government. The inhabitants sent a delegate to congress during the winter of 1856-'7, who presented their urgent request that the "Purchase" should be erected into a separate territory of the United States, but no definite action was taken at Washington on the subject. Arizona was a thriving and populous Spanish province 100 years ago. As early as 1687 the country was explored by a Jesuit missionary from Sonora, who established missions at various points in its fertile valleys, and having reported that the country was rich in the precious metals, a rapid emigration took place, and, in 1757, just 100 years ago, according to an old map of that date, the present territory contained more than 40 towns and villages, many of which were of considerable size and importance. At that time more than 100 silver and gold mines were in successful operation. Indeed, mining was the chief occupation of the inhabitants, yet considerable attention was paid to agriculture, the alluvial valleys producing wheat, maize, cotton, and all the fruits known to the southern clime in abundance. The Indians in the vicinity of the missions, after having been reduced to obedience by the Jesuits, and subjected afterward to slavery by the Spaniards, at whose hands they received the most inhuman treatment, finally rebelled against their cruel task-masters, and uniting with the more wild Apaches, who had never been enslaved, succeeded ultimately in driving out or putting to death nearly all the Spanish, or Mexican inhabitants. Civilization, of course, rapidly disappeared, and at the time of the purchase the country contained scarcely any white population, except a few Mexicans in the Mesilla valley, and at the old town of Tucson. The traces of the civilization to which the country had once attained, were seen in deserted ranches, here and there an adobe house, and the dimly visible ruins of once populous towns, and extensive mining operations. The most prominent monuments of this civilization still remaining are the ancient town of Tucson, and the mission San Xavier del Bac, a church edifice of remarkable size and beauty, magnificently ornamented within. The pious labors of the Jesuits to christianize the savages are still visible in the condition of the Mission Indians, the Pagagos, and Pimos tribes, who live in pueblos, or villages, and cultivate the soil, raising cattle, horses, good crops of wheat,

maize, and cotton, which latter they manufacture into cloth, and are said, in short, to possess a civilization which loses nothing by comparison with that of their Mexican neighbors. Arizona is much cut up and traversed by mountains, yet possesses many fertile valleys, capable of sustaining a large population, chief among which are the Mesilla, Rio Grande, San Pedro, Gila, Santa Cruz, &c. The Mesilla and Rio Grande valleys are the most densely populated, containing about 5,000 inhabitants, a majority of whom are Mexicans. Next in point of population is the Santa Cruz valley. The Santa Cruz river traverses the territory from north to south, disappearing near Tucson, and is supposed to reach the Gila by a subterranean passage. Many of the ranches deserted by the former inhabitants have large well-built adobe houses, which have recently been occupied by squatters. Much difficulty is likely to grow out of the questions of land titles in Arizona. The Apache Indians claim the soil by right of conquest; the former owners of the ranches, who were driven out by the Apaches, claim under the old Mexican laws, and, added to these, are the squatters' claims. The country is represented as still rich in copper, silver, and gold, and a thriving commerce is said already to have sprung up between Arizona and San Francisco.

ARJISH, or **ERJAH-DAGH**, the ancient Argæus, the loftiest mountain of Anatolia, lying 18 miles S. from Kaisareeyah, and 117 miles N. by W. from the head of the bay of Iskenderoon, in lat. 39° 8' N. and long. 35° 40' E. It ascends in an insulated peak to the height of 13,100 feet. It is distinctly visible at a distance of 160 miles, and it was believed by the ancients that both the Euxine and Mediterranean seas could be seen from its summit. It was formerly a volcano, and its sloping sides are covered with volcanic cones and craters, and present a black and desolate appearance. Its summit is covered with perpetual snow, and the natives of the surrounding country affirm that of all the efforts which have been made to scale its frozen steeps none have within their knowledge been successful.

ARK. I. A chest or coffer. Such is still its use in the north of England, where a square box, like our meal chests and used for the same purpose, is called an ark. II. It is also used to designate a kind of flat boat used on our western rivers. III. But the term is now principally a scriptural one, and as such stands for 8 different objects: 1. The vessel constructed by Noah, according to Gen. vi., and which was made of gopher wood, pitched within and without, and destined to float Noah and his family and the animals which by divine appointment he was to receive in it, over a sea which was to deluge the earth, and destroy every living thing. The form of the ark, if we may conclude from the term by which it is designated, was that of an oblong chest, while its dimensions, as given by Moses, were 300 cubits in length, 50 in breadth,

and 30 in height. Two questions have been raised, with a design to throw discredit on the account of Moses. The first as to the form of the ark, that it was not adapted for floating—the second, as to its dimensions, that it was not large enough to answer the purposes for which it was designed, and which he says it actually served. Both to strengthen and to obviate the objections raised, many curious speculations have been resorted to, to prove the basis of calculations. The length of the cubit is generally set down at 21 inches, which would make the ark 512 feet in length, 87 in breadth, and 52 in height. No very valuable results have been attained on either side of this question. The religious traditions of nearly all nations speak of a deluge and a similar vessel, constructed to outlive the destruction of all things else. (For a more detailed account of the ark see Calmet.)

3. The ark of bulrushes in which Moses relates himself to have been exposed by the edge of the river Nile, to save him from the destruction ordered by Pharaoh. 8. The ark of the covenant, or testimony, among the appointments of the Jewish tabernacle and temple. This was built of shittim wood, inlaid and overlaid with pure gold. Its dimensions were about 8 feet and 9 inches in length and 2 feet 7 inches in width and height. Its location was in the holy of holies, or the inner sanctuary, separated from the outer by a veil. The cover of this ark was the mercy seat—over which stood the two cherubim, and floated the cloud of the divine glory. The contents of the ark of the covenant were the tables of the law received by Moses (from which the ark had its name), the pot of manna, Aaron's rod, and a copy of the book of the law. The Jews esteemed this ark peculiarly sacred. It was made to be carried in procession before them in the journey to the promised land, and for this purpose was committed to the care of the Kohathites, and none were permitted to touch it but the tribe of Levi. Uzzah, having put forth his hand to steady it, in the attempt to bring it back from the Philistian captivity, was smitten unto death. It probably never was returned from the captivity of Babylon—and Josephus expressly says that when Jerusalem was taken by Titus, there was nothing in the sanctuary. All ancient systems of religious worship had arks or coffers for the reception of such things as were deemed sacred.

ARKANSAS, a county in the E. S. E. part of the state of the same name, is bounded on the E. by White river, and intersected by the Arkansas, both of which are navigable by steamboats nearly the whole year. The surface is level, and about one-third of it is occupied by Grand Prairie, the largest in the state. This prairie is fertile and suited to the culture of corn and cotton. In 1850 the productions were 116,535 bushels of Indian corn, 4,204 of peas and beans, 10,712 of sweet potatoes, and 3,769 bales of cotton. The public schools numbered 95 pupils. Capital, Arkansas Post. Pop. 3,-

245, of whom 1,538 are slaves. Area, 1,300 sq. m.

ARKANSAS, one of the states of the American union, is classed on the maps as a western state, while in its climate, productions, and institutions, it has more affinity with the southern states. It takes its name from a now extinct tribe of Indians who spoke the Osage language. Arkansas is situated between lat. 33° and 36° 30' N., and between long. 89° 45' and 94° 40' W., having an extent of 240 miles from north to south, and varying from 170 to 250 miles from east to west, the narrowest part being on the south line and the broadest on a parallel of lat. 36° N., including an area of 52,198 square miles. The state is bounded N. by the state of Missouri and a parallel of 36° 30' N. E. by the St. Francis river, which also separates it from Missouri, and the Mississippi river, which divides it from the states of Mississippi and Tennessee, S. by the state of Louisiana and the parallel of 33° N. and the state of Texas, and W. by Texas and the Indian territory. The state is divided into 54 counties, as follows: Arkansas, Ashley, Benton, Bradley, Calhoun, Carroll, Chicot, Clark, Columbia, Conway, Crawford, Crittenden, Dallas, Desha, Drew, Franklin, Fulton, Greene, Hempstead, Hot-spring, Independence, Izard, Jackson, Jefferson, Johnson, Lafayette, Lawrence, Madison, Marion, Mississippi, Monroe, Montgomery, Newton, Ouachita, Perry, Phillips, Pike, Poinsett, Polk, Pope, Prairie, Pulaski, Randolph, Saline, Scott, Searcy, Sebastian, Sevier, St. Francis, Union, Van Buren, Washington, White, Yell. There are no very populous cities or towns in this state. The oldest settlement is Arkansas Post, the chief town of Arkansas county on the river of the same name, about 50 miles above its junction with the Mississippi. It was settled by the French in 1685, and contains some 500 inhabitants. Little Rock, the state capital, is also situated on the Arkansas river about 300 miles above its mouth, in lat. 34° 40' N. and long. 92° 10' W. It was founded in 1690, is built on a commanding bluff, contains about 3,500 inhabitants, and is a place of considerable business and traffic, communicating, as it does, by steamboats with the principal towns on the Arkansas and Mississippi rivers. Among its public buildings are a state-house, penitentiary, U. S. arsenal, and half a dozen churches. It has 2 or 3 weekly newspaper offices. Van Buren, on the left bank of the Arkansas, in Crawford county, near the western border of the state, is a thriving town, as is also Fort Smith a few miles above, on the right bank. Both these towns do a prosperous business with the traders and travellers between St. Louis, Mo., and Santa Fé, New Mexico. Van Buren contains about 1,500 inhabitants and Fort Smith 2,000. The other principal towns are Batesville, the chief town of Independence county on the White river; Helena, Phillips co., on the Mississippi; Fulton on the Red river; Warren, Carrollton, Marion, Princeton, Pine Bluff, Camden, Bolivar,

Eldorado, Fayetteville, Washington, Clarks-ville, &c., containing populations of from 400 to 1,200 each.—The population of Arkansas in 1850 was 209,897, of whom 162,189 were whites; 608 free persons of color, and 47,100 slaves. The following table will show the increase in population, both slave and free, from 1820, the year after Arkansas was organized as a territory, to 1854:—

Census.	Whites.	Free Col'd.	Slaves.	Total.
1820	12,579	77	1,517	14,373
1830	25,671	141	4,576	30,388
1840	77,174	485	19,985	97,644
1850	162,189	608	47,100	209,897
1854	187,219	614	59,297	247,113

Of the free inhabitants in 1850, the number born within the state was 63,206; in Virginia, 4,737; North Carolina, 8,772; South Carolina, 4,587; Georgia, 6,367; Alabama, 11,250; Mississippi, 4,463; Louisiana, 1,096; Tennessee, 33,807; Kentucky, 7,428; Ohio, 1,051; Indiana, 2,128; Illinois, 3,276; Missouri, 5,328; New England states, 542; other states, 2,307; European countries, 1,628. The employments of the free male population over 15 years of age (40,785) were, in 1850, as follows: agriculture, 28,942; labor, not agricultural, 5,684; commerce, trade, manufactures, mechanic arts, and mining, 4,296; army, 38; navigation, 106; law, 224; medicine, 449; divinity, 233; other pursuits requiring education, 676; governmental service, 110.—Arkansas has no sea-coast, but is remarkably favored with navigable streams. The Mississippi river washes its eastern border for a distance of 3 degrees, separating it from the states of Tennessee and Mississippi, though by its tortuous course the actual distance is probably between 300 and 400 miles. The Arkansas river, one of the largest tributaries of the Mississippi, having its source by numerous branches high up in the Rocky mountains, traverses the state by a tortuous route through its centre, the general direction being from N. W. to S. E. for a distance by the course of the stream of about 1,500 miles, and is navigable far above the limits of the state into the Indian territory. The Red river, a large navigable stream which rises in New Mexico, flows through the south-west corner of the state, affording commercial facilities to the counties of Sevier, Hempstead, and Lafayette. The St. Francis river rises in the Ozark mountains of Missouri, forms the boundary between Missouri and Arkansas for a short distance, runs through the north-eastern corner of the state, and empties into the Mississippi a short distance above Helena. Although a large river, its navigation is rendered difficult by numerous rafts or snags. For a distance of some 50 miles the river spreads out into a lake of from 5 to 20 miles in width, supposed to have been produced by a sinking of the earth caused by the great earthquake of 1811. The St. Francis is 450 miles in length, and navigable for 150 miles at favorable seasons of the year. White river rises in the north-west corner of Arkansas, and, after running north into Missouri, returns into Arkansas,

takes a south-eastern zig-zag course, and empties into the Mississippi some dozen miles above the mouth of the Arkansas. White river is about 600 miles in length, and is navigable for small steamers to Batesville, 260 miles from its mouth, and, when cleared of snags and drift-wood, may be ascended at favorable seasons at least 400 miles. It has numerous tributaries rising in Missouri, the chief of which are the Black or Big Black and Spring rivers. The former takes a southern direction and joins White river 80 or 40 miles below Batesville, and is navigable for steamers during the greater part of the year, a distance of 100 miles. The Washita or Onachita rises in the western part of the state, south of the Arkansas river, runs in a south-eastern direction parallel with that stream, passing through a beautiful and fertile portion of southern Arkansas, thence running south through a portion of Louisiana, empties into the Red river near its junction with the Mississippi. It is navigable for about 350 miles from its mouth. Its chief tributaries are the Little Missouri, Sabine, Saline, Bayou Boeuf, &c. The Ozark mountains, commencing near Little Rock, north of the Arkansas river, stretch away in a north-western direction beyond the borders of the state, but seldom rise to an elevation beyond 1,500 or 2,000 feet. They are composed chiefly of limestone, clay, slate, sandstone, greenstone, and granite. South of the Arkansas is the Masserne range, which is so barren that the gray sandstone of which the mountains are mainly formed, is the prevailing color of the landscape.—The physical conformation of Arkansas presents great variety. The eastern portion of the state, bordering on the Mississippi river, including a strip ranging from 80 to 100 miles in width, is low and flat, covered by dense forests interspersed with swamps and small lakes or ponds, frequently of stagnant and unhealthy water. This portion of the state is annually overflowed by the floods of the Mississippi, Arkansas, and other rivers. Passing west, the surface gradually rises, and near the centre of the state the country becomes hilly, and the forests are interspersed with rolling prairies. Still further west these hills terminate in the Ozark mountains, and beyond these is an extensive elevated plain continually increasing in height in its course toward the Rocky mountains, in which it finally terminates. The valley of the St. Francis river in the north-eastern part of the state, is a continuous swamp, filled with shallow lakes and bayous, and covered with a heavy growth of cypress, gum, and sycamore, the cypress growing in the water, and the other trees in the marshes or swamps. Rising into the higher land, where the soil is comparatively dry, the surface is covered with a growth of white oak and hickory, with occasional thickly set cane-brakes.—The mineral wealth of Arkansas is as yet comparatively undeveloped. It is known that the state abounds in cannon, anthracite, and bituminous coal, which is found in greatest profusion along the

banks of the Arkansas river on either side, from a point a short distance above Little Rock to the western boundary of the state. Iron ore of a good quality has been found in the Ozark mountains. Zinc ore exists more extensively in Arkansas than any other state in the union except New Jersey. Galena or lead ore, frequently bearing silver, abounds in various parts of the state. Gold has been discovered in White county, but has never been profitably worked. Manganese is very abundant, and, according to De Bow, Arkansas contains more gypsum than all the other states in the union. Near the hot springs in the Washita valley, is an immense bed of superior oil-stone, or novaculite, said to be equal to the celebrated Turkish oil-stone. Salt of very good quality is produced from the saline springs in the vicinity of Washita and elsewhere.—The soil of Arkansas varies from the richest and most productive to the most sterile; and the climate and productions are equally varied. The river bottoms, composed of a black alluvium deposited from the higher lands by the floods of untold centuries, are wonderfully fertile, producing bountiful crops of cotton, corn, tobacco, sweet potatoes, melons, peaches, grapes, and various other fruits. The soil is well adapted to sugarcane, but the climate is not sufficiently warm. There are also immense tracts of submerged bottoms equally rich, which might be brought under cultivation by a judicious system of drainage. Rising from the valley, the soil becomes less productive, and in many places will not repay cultivation; while large portions of the uplands, particularly in the northern part of the state, produce good crops of wheat and other grain, as well as the best of apples, and are well adapted to grazing, which is carried on to considerable extent. The uplands are largely interspersed with rolling prairies, which are generally well watered, though Grand Prairie, 90 miles long and 30 broad, situated between Arkansas and White rivers, is an exception, being almost entirely without water. The low valleys are entirely destitute of good water, the inhabitants resorting to rain water, which is collected and kept in large tanks sunk into the ground, and filtered river water. These valleys are very unhealthy, particularly to the unacclimated. The more elevated portions of the state are quite salubrious.—The climate of Arkansas is temperate, but subject to sudden changes in consequence of the north winds. The temperature at Little Rock usually ranges from 15° to 99° F., and averages 62° 66', though the mercury has been known to fall as low as 8°. The mean temperature for the winter months—Dec., Jan., and Feb.—is 45° 82'; for June, July, and August, 79° 66', the mercury reaching 90° or above for from 40 to 50 days during the summer. Terrific thunderstorms prevail during the spring and summer. Nearly 8 inches of rain fell in this state during the month of April, 1850.—The productions of Arkansas are mainly agricultural. The area of the state, in acres, is

88,406,720, of which, in 1850, only 2,598,214 acres were laid out in farms, and only 781,580 acres were under improvement; though the amount is now (1857) much greater. The cash value of these farms in 1850 was estimated at \$15,265,245. The value of farming utensils was put down at \$1,601,296; live stock, consisting of horses, asses, mules, cattle, sheep, and swine, \$6,647,969; animals slaughtered, \$1,168,818. The produce of the state for the same year was 27,137,600 lbs. of ginned cotton, 182,595 lbs. of wool, 1,854,289 lbs. butter, 80,088 lbs. cheese, 192,388 lbs. beeswax and honey, 68,179 lbs. rice, 218,986 lbs. tobacco, 199,689 bushels wheat, 8,047 rye, 8,893,989 maize, 656,188 oats, 285,788 peas and beans, 193,832 Irish potatoes, and 788,149 sweet potatoes. The value of orchard products was \$40,141; of home-made manufactures, \$688,217. The people of Arkansas as yet pay very little attention to manufacturing. According to the census of 1850, the number of manufacturing establishments in the state producing each \$500 and upward annually, was only 271, of which 8 were cotton factories. The capital invested was \$338,154; raw material and fuel consumed, \$286,899; and the aggregate product per annum was \$668,815.—A state census was taken in 1854, of which only a few details have been published; but from such as are accessible, it appears that there were in the state 5,025,926 acres of land laid out in farms, the improvements on which were valued at \$22,846,247. Of the lands under cultivation, 256,666 acres were in cotton, and 600,513 acres in grain, producing 160,779 bales of cotton, 11,536,969 bushels of corn, 333,535 bushels of wheat, and 1,040,206 bushels of oats. The value of city lots and improvements was estimated at \$2,558,170; sawmills, \$174,585; tanneries, \$24,200; distilleries, \$2,946; household furniture, \$66,465; pleasure carriages, \$97,496; horses over 2 years old, \$2,766,504; do. mules, \$873,878; do. asses, \$74,603; do. neat cattle, \$1,701,120; stock in trade of all trades, \$1,885,047; loans over debts, \$405,705; steamboats and ferries, \$61,945; gold watches and jewelry, \$116,808; capital employed in manufactories, \$16,220; slaves over 5 and under 60 years of age (40,612 in number), \$22,728,825—making the total taxable property of the state \$55,837,384, being an increase of \$20,841,499 in 4 years, from 1850 to 1854. The tax for the latter year was \$146,488.—The state is remarkably well stocked with wild animals, valuable for their meat, hides, and furs, among which are the buffalo, deer, elk, beaver, otter, rabbit, raccoon, wild cat, catamount, wolf, and bear. Wild turkeys, geese, quails, and various other birds, are also found in great abundance.—The chief exports of the state are cotton, maize, wool, hides, and lumber, which find a market in New Orleans, through which port Arkansas receives her foreign merchandise. A thriving domestic commerce is carried on along the Mississippi, Arkansas, and other navigable streams of the

state; and the traffic with the Indians on the western border is of considerable importance.—Among the most striking natural curiosities in the state are the famous hot springs, which are much visited by the curious tourist as well as the invalid, the waters being regarded as beneficial to those suffering from the effects of mercury in the system, rheumatism, stiffness of the joints, &c. These springs are situated on a small tributary of the Washita, about 6 miles from that river, and 60 miles S. W. from Little Rock, in Hot Springs county. They are remarkable both for their numbers and the high temperature of their waters. From 75 to 100 of these springs, varying in temperature from 105° to 160° F., issue from a lofty ridge of sandstone overlooking the town, while a number rise from the bed of Hot Spring creek, which flows at the foot of the ridge, and, by reason of the springs, is rendered sufficiently warm for bathing in midwinter. High upon the ridge, and within a few feet of a hot spring, issues a spring of pure cold water. In Pike county on the Little Missouri river, is a natural bridge, which is quite a famous curiosity; and near by is a mountain of very fine alabaster. The mountainous portions of the state frequently exhibit bold and pleasingly picturesque scenery.—Arkansas has no state asylums, or institutions for the instruction of the deaf and dumb or the blind, nor for meliorating the condition of the insane; and the institutions for general education are by no means equal to those of the south-western states generally. The census returns for 1850 report 858 primary and public schools, with 855 teachers and 8,449 pupils; 90 academies and other schools, with 126 teachers and 1,407 pupils, and 8 universities and colleges, with 14 teachers and 150 students. The state contains 16,935 white adults, who are unable to read and write, being a fraction more than one-fourth of the entire white adult population. The secretary of state, who is *ex officio* state commissioner of common schools, in a late report complains that the returns from the school officers are exceedingly imperfect; and that while the sale of school lands granted by congress would create a large fund, so that “the great obstacle to the organization of common schools is not so much a deficiency in the means to sustain them,” as “the indifference that pervades the public mind on the subject of education.”—Nine weekly newspapers are published in Arkansas, with an aggregate circulation of 7,250, or 377,000 copies annually.—The most numerous religious denominations in the state are the Methodists and Baptists. The former have 168 churches, valued at \$27,070, with accommodations for 14,250 worshippers; the latter, 114 churches, with accommodations for 14,780, and church property worth \$21,870; the Presbyterians, 25 churches, accommodating 7,200, and church property worth \$28,275; Roman Catholics, 6 churches, accommodating 1,400, and church property worth \$6,650; the Episcopalians, 2 churches, accommodating 350;

the Unionists, 5 churches, with accommodations for 1,800 worshippers. There are several other minor religious sects in the state, making the total number 362, with accommodations for 60,326 worshippers, and church property valued at \$89,825.—The constitution of Arkansas provides for a legislature composed of a senate of not less than 17 nor more than 33 members, to be elected from single districts for a term of 4 years; and a house of representatives, which shall consist of not less than 54 nor more than 100 members, to be chosen from counties every 2 years. The present senate consists of 25 members, and the house of 75. The legislature hold sessions biennially, on the first Monday in November, and members receive \$3 per diem, and \$3 for every 20 miles of travel to and from the capital. The executive power is vested in a governor, who holds his office for 4 years, but is ineligible for more than 8 years in a consecutive term of 12 years. He receives a salary of \$1,800 per annum, and the free use of the executive mansion. He must be a native of the United States, and a citizen of Arkansas for 4 years preceding his election. General elections are held biennially on the first Monday in August; and every white male citizen of the United States, who shall have been a citizen of Arkansas for 6 months preceding an election, may vote in the county where he resides. Soldiers of the U. S. army, and sailors and marines of the U. S. navy, are excluded from the elective franchise. The elections must be held *visa voce* unless otherwise ordered by the legislature. A secretary of state, auditor of public accounts, and state treasurer, are elected by the legislature in joint ballot. The judicial power of the state is vested in a supreme court of 8 justices, having appellate jurisdiction only (except in particular cases pointed out by the constitution), holding 2 terms annually at Little Rock; 7 circuit courts, having original jurisdiction over all criminal cases not expressly otherwise provided for; exclusive original jurisdiction of all crime amounting to felony at common law; original jurisdiction of all civil cases not recognizable before justices of the peace, and all matters of contract where the sum in controversy exceeds \$100; county courts and justices of the peace. The judges of the supreme court are elected by the legislature for 8 years, and the circuit judges by the people for 4 years. The constitution prohibits the legislature from enacting laws for the establishment of lotteries and the sale of lottery tickets; also forbids the emancipation of the slaves of the state without the consent of their masters, and guarantees jury trial to slaves charged with crime. Arkansas has 2 representatives in the popular branch of congress, and is entitled to 4 electoral votes for president of the United States. There are no banks in Arkansas.—The state has done nothing as yet in the way of internal improvements beyond the establishment of post roads, and the improvement of some of her navigable streams, though a number of railroads have been pro-

jected. Among these are the Cairo and Fulton road, starting at Ohio city, Mo., opposite Cairo, Ill., crossing the S. E. corner of Missouri, traversing Arkansas diagonally (via Little Rock) from N. E. to S. W., and passing thence to Houston, Texas; the Memphis and Little Rock road, extending from a point opposite Memphis, Tenn., in a western direction to Little Rock; the Helena and Little Rock road, starting from Helena on the Mississippi, running west to Little Rock, and thence in the same direction to Van Buren and Fort Smith, and into the Indian territory; a road from Fort Smith to run eastwardly and connect with the New Orleans, Opelousas, and Great Western road at Vicksburg, Miss.; a road from Fort Smith running north to Batesville, and thence into Missouri to connect with the South-western Pacific road; and a road from Helena running in a north-western direction to Yellville. Of the above roads, only the Cairo and Fulton, and Memphis and Little Rock, are in course of construction. —Arkansas was originally a portion of the territory of Louisiana, purchased from the French under the administration of Thomas Jefferson, in 1803, for the purpose of commanding the mouth of the Mississippi river. Arkansas remained a part of Louisiana territory till 1812, when the present state of Louisiana was admitted as a member of the American union, and the remaining portion was organized as Missouri territory, which name it held till 1821, when the state of Missouri was admitted to the union, and Arkansas was erected into a territory bearing its present name. It remained under a territorial government till June, 1836, when a constitution was formed at Little Rock, and Arkansas became an independent state of the American confederacy. In 1854 the state debt of Arkansas amounted to \$4,260,574, of which \$1,848,184 was for interest accrued and unpaid. Since that time certain state bonds have been cancelled, reducing the state debt to \$3,819,586.

ARKANSAS RIVER, the largest tributary of the Mississippi, after the Missouri, rises in the Rocky mountains, in about 42° N. lat., passes from the Indian territory into the state of Arkansas, through the middle of which it sweeps, and empties into the Mississippi, after a course of over 2,000 miles. Its navigation is unobstructed by shoals or rapids. It passes first through arid plains, then through a fertile country, and, for 40 miles above its mouth, through an inundated forest.

ARKEKO, or **ARKIKO**, a seaport town of Abyssinia, on a bay of the Red sea, lat. 15° 35' N. long. 89° 25' E.

ARKLOW, a maritime town and parish of Ireland, county of Wicklow, on the Avoca, 89 miles S. S. E. of Dublin. It is situated about 500 yards from the point at which the river pours into the sea. Pop. in 1851, 8,300.

ARKWRIGHT, GEORGE, great-grandson of the inventor of the spinning frame, born Aug. 20, 1807, died in London, Feb. 5, 1856. He was

a barrister-at-law, a magistrate for Derbyshire, and member of parliament for Leominster on several occasions. His election was due to his family connections, rather than to his qualifications.

ARKWRIGHT, SIR RICHARD, inventor, born at Preston, Lancashire, Dec. 28, 1782, died Aug. 8, 1792. He was the youngest child of a family of 13, and his parents were too poor to give him any education. He earned his living as a barber, shaving in a cellar for a penny, till he was 80, when he became acquainted with a clock-maker of Warrington, named Kay, with whom he attempted to construct a perpetual motion. At that time English cottons were made with only the warp of cotton, the warp being of linen, and it was considered impossible to spin cotton so as to make it applicable as warp. Moreover, the supply of warp was short of the demand, though Hargreaves of Lancashire had shortly before invented his jenny, and had several machines at work in Nottingham. Such was the state of things in 1768, when Arkwright produced a model of a new machine for spinning cotton thread, but fearing the same hostility that had driven Hargreaves away, he proceeded at once to Nottingham. There he met with the Messrs. Wright, bankers, who engaged to furnish the capital necessary to perfect the invention, but these gentlemen soon became frightened, and retired. Arkwright then applied to Messrs. Need and Strutt, and the last, being a good machinist, saw at once the value of the invention, and the firm took an interest in it. Arkwright was profoundly ignorant in mechanics, but a few suggestions of Mr. Strutt about the wheel-work, overcame the last difficulty, and a machine driven by a horse was soon in operation. In 1771 another mill, driven by water power, was established at Oromford, in Derbyshire. The first patent was granted in 1769, and unsuccessfully contested in 1772. In the year 1775 Arkwright obtained a new patent for improvements, but it seems he had included in it things discovered before, and 6 years later it was declared void by the courts, but in 1785 he obtained a decision in his favor, and was reinstated in the monopoly. The object of Arkwright's invention was to spin cotton fine, and with a hard twist, and fit for warp. This was done by the use of drawing-rollers, by sets of two, each succeeding set moving faster than the last, thus extending the cotton between them, and by a fast revolving spindle giving the twist to the cotton as it came out from between the last pair of rollers. The introduction of this machine, which was far superior to that of Hargreaves, caused the latter to die of grief. Arkwright was well repaid for his ingenuity. As a manufacturer he accumulated a fortune of \$2,500,000. He was elected sheriff of Derbyshire, and was knighted on the occasion of presenting an address to the king. His invention enables one man to do as much work as 180 could do before, and it is calculated that

40,000,000 hands would scarcely be sufficient to accomplish the spinning now done by machinery in England alone.

ARLAND, JACQUES ANTOINE, a miniature painter, born at Geneva in 1688, died there in 1748. He practised his art in Paris, where the regent was one of his pupils, and afterward in England, where he acquired the friendship of Sir Isaac Newton. He made a fortune, and in 1729 returned to his native country.

ARLANGES, JOSEPH MARIE GASTON D', a French marshal, born in the village of Maréché, in the department of Sarthe, Sept. 1, 1774, died July 13, 1848. On the outbreak of the revolution he emigrated with his family, and fought for the cause of royalty under Condé, and in the Vendée under Antiochamp. Subsequently he took an active part in the war with Spain, and especially won fame by his exploits in Africa. He distinguished himself at the first capture of Mascara, but failed in the expedition of Tlemcen under Marshal Clausel in 1836.

ARLES, one of the oldest cities of southern France, on the left bank of the lower Rhone, at the point where the river divides into 2 branches to enclose its delta or the island of Camargue, 46 miles N. N. W. of Marseilles. It is an ill built, dirty, and somewhat unhealthy place, but enjoys great historical celebrity. An important town on the invasion of Cæsar, who calls it *Arelate*, it afterward became a Roman colony, and was long large, rich, and populous. Its amphitheatre, although not as well preserved as that of Nîmes, is superior in size and magnificence. An Egyptian obelisk, consisting of a single block of granite about 54 feet in height, is yet standing on one of the public thoroughfares, while the ruins of an aqueduct, of 2 temples, of a triumphal arch, an extensive cemetery, and numerous fragments of granite and marble columns, are to be seen in different parts of the dilapidated city. The beautiful statue known as the *Venus of Arles*, a rival to the *Venus de' Medici*, was discovered here in 1651, and is now in the imperial museum at Paris. The Roland tower, and the Byzantine church of St. Trophime, must also be mentioned, as also the town hall, designed by the illustrious Mansard. Arles, moreover, contains a school of navigation, a college, a collection of natural history, a museum of antiquities, a public library, and a theatre. Silk, soap, and glass bottles are manufactured, and the sausages of Arles are in high esteem. Pop. 20,286. Arles is celebrated for the beauty of its women, in many of whom the Roman physiognomy is preserved in a striking manner. In their head-dress, too, many of them remain faithful to the ancient Roman customs.—The CANAL OF ARLES was constructed to obviate the difficulties in the navigation of the Rhone and Durance, has 2 branches starting from the city of Arles; the one, running S., ends at Port Bouc, on the sea, E. of the eastern mouth of the Rhone, the other running E. joins the Durance opposite to Cade-

net. It is also connected with the canal of Beaucaire, and consequently with that of Languedoc, so that it has become the centre of a considerable and growing trade.

ARLINCOURT, VICTOR, viscount d', a French poet and novelist, born 1789, died Jan. 22, 1856. His father, a farmer of the public revenue, was one of the victims of the revolution, but left him the greater part of his wealth. Victor commended himself to Napoleon's notice by publishing, in 1810, an allegorical poem, entitled *Une matinée de Charlemagne*, in which the vanity of the emperor was taken by flattering allusions. The writer was rewarded by being appointed at once an equerry to Madame Mère (such was the title of Napoleon's mother), and an auditor under the council of state. He next undertook an epic poem, the hero of which was still Charlemagne, or rather Napoleon himself under that name, but it was unfinished on the fall of the empire. D'Arlincourt now had to change his poetry as well as his political opinions. This was very easily done, as he had a natural preference toward the Bourbons. He did not, however, meet with the favor he expected at the hands of Louis XVIII., but consoled himself by giving his whole attention to literature. The publication of his *Caroliade* was soon followed by that of a novel, *Le Solitaire*, which made a decided hit; at least it became an object of admiration to some, though it was laughed at by many. Whatever its intrinsic value, it certainly drew a good deal of attention, was dramatized at one of the principal theatres, and burlesqued at two others. Then appeared, in succession, *L'Etrangère*, *Le Renégat*, and *Ipsidote*, which increased the equivocal fame of their author. But the most singular events of his literary career were the publication of a novel in rhyme, *Ismaslie, ou l'amour et la mort*, which was marked by more eccentricities than the preceding works, and the performance at the French theatre of a tragedy, *Le Siège de Paris*. The most extraordinary lines, the oddest combination of syllables producing the strangest confusion of ideas, were received with such bursts of laughter that the actors did not attempt a second performance. When the laughter had subsided, D'Arlincourt fell into comparative obscurity, but was afterward called out again by the revolution of 1830. Then, under the disguise of so-called historical novels, he published several regular satires on the government and men of the time. After 1848 he turned his attention to politics still more decidedly, and published two pamphlets, *Dieu le veut*, and *l'Italie Rouge*, in which he uttered such gross calumnies against the democratic leaders that he was brought to account before a court of justice, and sentenced as guilty of libel. This somewhat quieted his hot spirit, and from that time he lived in retirement.

ARLON, a town of Belgium, capital of the province of Luxembourg, 104 miles S. E. from Brussels. It is seated on an eminence sur-

rounded by forests, and has an active trade in grain, and manufactures of woollen stuffs. It is the ancient Orolanum, and possesses a number of antiquities, coins, and busts of heathen divinities, which have been discovered near it. It was pillaged in 1793 by the French, after a victory gained in the neighborhood over the Austrians. During the wars of Louis XIV. it was several times captured by the French and Spaniards.

ARMADA, SPANISH, the great naval armament sent by King Philip II. of Spain, in 1588, for the conquest of England, in order thereby "to serve God, and to returne unto his church a great many contrite souls that are oppressed by the heretics, enemies to our holy Catholic faith, which have them subject to their sects, and unhappiness." (*Expositio. Hispan. in Angl. Vera Descriptio*, A. D. 1588.) The fullest account of this armament is given in a book published, about the time it set sail, by order of Philip, under the title *La Felicissima Armada que el Rey Don Felipe nuestro Señor mando juntar en el Puerto de Lisboa 1588. Hecha por Pedro de Paz Salas*. A copy of this work was procured for Lord Burleigh, so that the English government was beforehand acquainted with every detail of the expedition. (This copy, containing notes up to March, 1588, is now in the British museum.) The fleet is therein stated to have consisted of 65 galleons and large ships, 25 *urcas* of 300 to 700 tons, 19 tenders of 70 to 100 tons, 13 small frigates, 4 galleasses and 4 galleys, in all 180 vessels, with a total tonnage of 75,868 tons. They were armed with 2,481 guns, of which 1,497 were of bronze, mostly full cannon (48 pdrs.), culverines (long 80 and 20 pdrs.), &c.; the ammunition consisted of 128,790 round shot and 5,175 cwt. of powder, giving about 50 rounds per gun, at an average charge of 4½ lbs. The ships were manned with 8,052 sailors, and carried 19,295 soldiers and 180 priests and monks. Mules, carts, &c., were on board to move the field artillery when landed. The whole was provisioned, according to the above authority, for 6 months. This fleet, unequalled in its time, was to proceed to the Flemish coast, where another army of 80,000 foot and 4,000 horse, under the duke of Parma, was to embark, under its protection, in flat-bottomed vessels constructed for the purpose, and manned by sailors brought from the Baltic. The whole were then to proceed to England. In that country Queen Elizabeth had, by vigorous exertions, increased her fleet of originally 80 ships, to some 180 vessels of various sizes, but generally inferior in that respect to those of the Spaniards. They were, however, manned by 17,500 sailors, and therefore possessed far more numerous crews than the Spanish fleet. The English military force was divided into two armies, one, of 18,500 men, under the earl of Leicester, for immediately opposing the enemy; the other, 45,000, for the defence of the queen's person. According to a MS. in the British museum, entitled "Details of the English Force Assembled

to Oppose the Spanish Armada," (MS. Reg. 18th c. xxi.), 2,000 infantry were also expected from the Low Countries. The armada was to leave Lisbon in the beginning of May, but, owing to the death of the admiral Santa Cruz, and his vice-admiral, the departure was delayed. The duke of Medina Sidonia, a man totally unacquainted with naval matters, was now made captain-general of the fleet; his vice-admiral, Martinez de Ricalde, however, was an expert seaman. Having left Lisbon for Corunna for stores, May 29, 1588, the fleet was dispersed by a violent storm, and, though all the ships joined at Corunna with the exception of four, they were considerably shattered, and had to be repaired. Reports having reached England that the armament was completely disabled, the government ordered its own ships to be laid up; but Lord Howard, the admiral, opposed this order, set sail for Corunna, learned the truth, and, on his return, continued warlike preparations. Soon after, being informed that the armada had hove in sight, he weighed anchor and accompanied it on its way up the channel, harassing the Spanish ships whenever an opportunity presented itself. The Spaniards, in the mean time, proceeded to the coast of Flanders, keeping as close together as possible. In the various minor engagements which took place, the handier ships, more numerous crews, and better seamanship of the English, always gave them the victory over the clumsy and undermanned Spanish galleons, crowded as they were with soldiers. The Spanish artillery, too, was very badly served, and almost always planted too high. Off Calais the armada cast anchor, waiting for the duke of Parma's fleet to come out of the Flemish harbors; but it soon received word that his ships, being unfit for fighting, could not come out until the armada had passed the straits and driven off the Anglo-Dutch blockading squadron. It accordingly weighed again, but, when in sight of Dunkirk, was becalmed between the English fleet on one side and the Dutch on the other. Lord Howard prepared fire-ships, and when, during the night of Aug. 7, the breeze sprang up again, he sent 8 of them among the enemy. They produced a perfect panic in the Spanish fleet. Some ships weighed anchor, some cut their cables, drifting before the wind; the whole fleet got into confusion, several ships ran foul of each other and were disabled. By morning order was far from being restored, and the several divisions were scattered far and wide. Then Lord Howard, reinforced as he was by the ships equipped by the nobility and gentry, as also by the blockading squadron under Lord Byron, and ably seconded by Sir Francis Drake, engaged the enemy at 4 A. M. The battle, or rather chase (for the English were evidently superior on every point of attack), lasted till dark. The Spaniards fought bravely, but their unwieldy ships were unfit for the navigation of narrow waters, and for a moving fight. They were completely defeated, and suffered severe loss. The junction

with the duke of Parma's transports having thus been foiled, a landing in England by the armada alone was out of the question. It was found that the greater part of the provisions on board had been consumed, and as access to Spanish Flanders was now impossible, nothing remained but to return to Spain to lay in fresh stores. (See "Certain Advertisements out of Ireland Concerning the Losses and Distresses Happened to the Spanish Navie on the Coast of Ireland," London, 1688—Examination of Emanuel Fremosa, who served in the San Juan, 1,100 tons, flag-ship of Admiral Ricalde). The passage through the channel being also closed by the English fleet, nothing remained but to round Scotland on their way home. The armada was but little harassed by the fleet of Lord Seymour sent in pursuit, as that fleet was badly supplied with ammunition and could not venture on an attack. But after the Spaniards had rounded the Orkneys dreadful storms arose and dispersed the whole fleet. Some ships were driven back as far as the coast of Norway, where they fell on the rocks; others foundered in the North sea, or struck on the rocks on the coast of Scotland or the Hebrides. Soon after, fresh storms overtook them on the west coast of Ireland, where above 80 vessels were lost. Those of the crews who escaped on shore were mostly killed; about 200 were executed by command of the lord deputy. Of the whole fleet not more than 60 vessels, and those in the most shattered condition, and with famine on board, reached Santander about the middle of September, when the plan of invading England was definitively given up.

ARMADILLO, (*dasypus*, Linn.) a genus of the class *mammalia*, and order *edentata*, forming a small but distinct family, intermediate between the sloths and ant-eaters and having an affinity to the families of *chlamyphorus* and *orycteropus*. They are distinguished by the possession of molar teeth only. The armadillos have, however, a far more obvious, though possibly less scientific characteristic, in their singular coat-armor, by which, instead of hair, their whole bodies and head are covered and protected. This armor consists, in all the species, of 8 bony bucklers, all composed of small polygonal plates set in juxtaposition to one another, but neither connected by joints nor separately movable, so as to form a sort of mosaic pavement. The bucklers which cover the rump and shoulders of the animal, forming, as it were, each, a single solid piece, are capable of little pliancy or motion save what is allowed during the life of the animal by the partial elasticity of the thin shell or crust lubricated by the animal oils which penetrate it. These bucklers, however, are connected by a number of transverse movable bands, composed of similar plates with the principal bucklers, which are themselves connected by the soft and pliant inner skin of the animal, and are thus rendered perfectly accommodating so as to admit of the most varied and rapid motions,

being situated immediately above the loins, to which region are assigned all the principal movements of animal economy. The buckler or helmet, which defends the head of the armadillo, has no connection of any sort with the armor of the shoulders, so that the neck is left perfectly free, while it is, at the same time, completely protected by the projection of the skull-piece, which defends the nape in the same manner as was done by the corresponding piece of an ancient helmet of the middle ages. Indeed, the whole arrangement of the defences of this singular creature bears so strong a relation to those of the man-at-arms of the 14th century, that if it were not the inhabitant of a continent unknown to the armorers who equipped those doughty knights in plate and mail, one could hardly doubt that the steel armor of the *bimano* had been copied from the scaly or bony panoply of the quadruped; the principal feature in both systems being the defence of the upper and lower portions of the body by solid and inflexible cuirasses and tuiettes, connected by flexible coverings to the central regions, strong enough to give protection, yet pliable enough to permit active motion. The legs of the armadillos are extremely short and stout, covered with scaly plates, furnished with powerful claws for burrowing in the ground, beneath which they form their habitations, and guarded, so far as to the knees, by the defending bucklers; which descend so low as to make a complete defence to the belly of the animal, which is covered only with a rough skin, from which originate a few long coarse hairs, and a partial one to the thighs and knees. Except in one species, which will be named hereafter, the armadillos are devoid of hair, save that above mentioned, and a few straggling bristles, which proceed from the inner skin, between the jointed plates of the lumbar region. The tails of all the species but one are armed with annular bands similar to those connecting the bucklers, and, in all, are adapted to a notch cut out of the posterior buckler in order to receive them. The teeth of the armadillos are of simple cylindrical form, varying from 7 or 8 to 17 or 18 in number, on each side of each jaw, and are so arranged, having interstices between them, that when the mouth is closed they shut one into the other, like those of a steel-trap. They have variably, in the different species, 4 or 5 toes on their fore feet, and invariably 5 on their hind feet. Their eyes are small, their ears erect and pointed; and they have elongated snouts, like those of the hog or ground-mole, to enable them to turn the ground in search of roots or worms, which constitute a portion of their food. They are mostly nocturnal in their habits, though a few of the species go abroad by day; perfectly inoffensive; are never known to bite, or attempt any defence; but when pursued immediately commence burrowing, which they do with such power and rapidity, that if they have the least start, they easily evade their pursuers, burying

themselves to any depth in the ground, from which they can only be expelled by introducing smoke or water into their subterranean galleries. So tenacious is their hold on the earth, when endeavoring to escape, by their strong, curved claws, that, if seized by the tail, they will leave it in the hand of the captor rather than forego their grasp. The ordinary food of armadillos consists of fallen fruits, roots, worms, ants, and carrion. Azara states that where armadillos abound, ants are never found, since those animals break into their hills and devour them as greedily as do the true ant-eaters. They are also said to break into the graves and devour the dead bodies, unless protected by brickwork. Their grinding teeth enable them only to feed on soft substances; and, therefore, they can devour flesh only when putrid. Abundance of this disgusting food they find, at all seasons, on the pampas of South America, where thousands of cattle are slaughtered weekly, for the sake of their hides alone, and left to putrefy on the plains. On this food the armadillos become immensely fat, when they are esteemed a great delicacy, not only by the Indians, but by the Spanish and Portuguese residents; and are served up, roasted whole in their shells, as one of the choicest culinary luxuries of the country. The armadillos were formerly classified according to the number of the jointed bands between the more solid portions of their armor; and were named after the same supposed characteristic, as it might be, the 3-banded, 8-banded, or 16-banded armadillos. It has subsequently, however, been ascertained that the number of bands is not a specific distinction; but varies according to age, sexual difference, and, perhaps, individual formation. They have, therefore, been arranged by Cuvier in 5 small groups, according to the arrangement of their teeth, toes, and other structural differences. 1. The *cachicames*; with 4 anterior toes, 7 teeth on a side, above and below, a pointed muzzle, and a long, annulated tail. 2. The *aparas*; with toes and tail as the last species, but with 9 or 10 teeth on each side, above and below. This animal has, also, the power of rolling itself into a ball like a hedgehog, in which condition it has been thrown over precipices without receiving any injury. 3. The *encouberts*; with 5 anterior toes and 9 or 10 teeth, throughout. In addition, however, they have 2 teeth on the intermaxillary bones of the upper jaw resembling incisors, in which they differ, not only from all armadillos, but from all the order *edentata*. 4. The *kabassous*; which have 5 toes both before and behind, but the claws obliquely arranged, so as to give them unusual power in burrowing and clinging to the soil when seized. They have 9 or 10 teeth, throughout; and their tails are undefended by armor, as in the other species. 5. The *priodontes*; or last subdivision of the armadillos, in addition to the unequal toes and enormous claws of the *kabassous*, have from 22 to 24 small teeth, throughout, on each side of all the jaws. Of the *cachicames*, or first

division, there are 3 species; of which the commonest is the *dasyppus peba*, or black tatu of Paraguay. It is about 16 inches in length, and was originally known under the appellations of the 7, 8, and 9-banded armadillo; 3 species being made out of 1. The other species of this group are the mule tatu, so called from the length of its ears, and the tatu *verdadero*, hardly distinguishable from the last, except by the breadth of the movable bands, and the size of the croup buckler. Of the *aparas*, there is but one species, the *mataco*, which has, in general, but 3 bands and a short, blunt tail, covered by a single horny crust. The *encouberts* have 3 species; the *poyou*, or yellow-footed armadillo, which has, usually, but 7 or 8 movable bands, and is easily known by his triangular snout, flat body, and short legs; the hairy armadillo, remarkable for its more copious growth of bristles from between the movable bands, and from its practice of burrowing into the bodies of dead horses, at whatever spot is first decomposed, and remaining within them until all the flesh is consumed, and nothing left but the skeleton and hide; and, lastly, the *pichiy*, which is the smallest of all the armadillos. The *kabassous* has but one species, the *tatouay*, or wounded armadillo, so called by the Indians from an idea that the scaly covering of its tail, which is naked and looks raw, has been torn off by violence. The last subdivision of armadillos, the *priodontes*, has, likewise, but one species, the *dasyppus gigas*, or great armadillo of Cuvier. It is remarkable for its size, being 3 feet 8 inches in length; for its movable bands, 12 or 13 in number, composed of rectangular plates; for the thickness of its tail at the base; and for the spiral lines of the scales by which it is defended. All the armadillos are inhabitants of South America, being found dispersed from Guiana and Brazil, over the pampas of Buenos Ayres, and south as far as Paraguay. For an animal of so unwieldy a form and so short-legged, the armadillo runs with remarkable speed, easily outstripping a man; and, what is still more worthy of remark, although the females in no species have more than 4 mammae, and in some but 2, they invariably produce 6 or 8, or even 10, young at a birth, bearing but once in a season—the former feature being almost an anomaly in natural history; as the number of the young produced at a birth, in any species, may be calculated, generally, unless in exceptional cases, by the number of teats on the dam, almost to a certainty.

ARMAGEDDON. Within the ancient territorial limits of the tribe of Manasseh was the celebrated Mount Carmel, at the foot of which, and on the western border of the great plain of Esdraelon, lay the city of Megiddo, which, true to its magnificent name ("the city that spoils"), had been the witness of many sanguinary and disastrous conflicts. Robinson, in his "Biblical Researches" (1838), expressed his conviction that the city now known as Lejjun, and to the Romans as Legio, occupies the site

of the ancient Megiddo. This conviction was strengthened by his last visit to the same region in 1852. The opinion of Dr. Robinson is grounded on the similarity of the topography assigned to Megiddo by the Scripture writers with that of Legio, as described by Jerome and Eusebius, and with that of Lejjûn; as also on certain architectural remains found by him in the latter city. If Megiddo is at length identified, we find in its topography a reason for its renown in the wars of the Holy Land, as also for the fact that the Israelites, although so aggressive, never willingly joined battle on the plains of Esdraelon, and when they did, were almost always unsuccessful. On this plain, "by the waters of Megiddo," took place the battle of Kishon, whose result is celebrated in the refrain of Deborah and Barak, the battle of Jezreel, in which Gideon triumphed over the Midianites, the battle of Gilboa, where Saul was defeated and slain by the Philistines, and finally, the battle of Megiddo, in which Josiah experienced a similar fate at the hands of Pharaoh Necho. Megiddo and Esdraelon are classic ground in the history of war, consecrated to strife from Joshua to Napoleon—for here, too, was the last fierce fight of the crusaders with the victorious Saladin, and here Bonaparte defeated the Syrians in 1799. Armageddon was not probably the name of any particular mountain peak, but the general title applied to the elevated table-land of Esdraelon, and so called because Megiddo was the principal military post of the entire plain, the term *Ar-Mageddon* signifying "mountain of Megiddo." Armageddon was, therefore, the great battle field of Palestine. In the mountainous north the Israelites gained a speedy possession, but the superior cavalry of the level south defended the occupancy of the original owners. Armageddon was the boundary line between the foes. How beautifully in this light does the Apocalyptic vision (Rev. xvi. 16) describe God as summoning his foes to a place called Armageddon, to "the battle of the great day of God Almighty."

ARMAGH, a city, borough, and parish of Ireland, capital of the county of Armagh, and the archiepiscopal seat of the Irish primate. It is well built, has a public library and an observatory. Between the 5th and 9th centuries there was here a celebrated school of divinity and letters, frequented by great numbers of students. Pop. 8,849.

ARMAGNAC, the name of an ancient family of Gascon sovereign princes. Very powerful during the 14th and 15th centuries, they were finally broken down by the implacable Louis XI. Some of them deserve to be specially noticed. I. **JOHN I.**, count of Armagnac, aided the count of Eu, high constable of France in the war against the English, in Gascony and Guyenne; was president of the estates of Languedoc in 1355, and refused to pass under English dominion after the treaty of Bretigny; made war against the count of Foix, who took

him prisoner; joined the Black Prince to re-establish Don Pedro IV. on the throne of Castile, and died in 1378. II. **BERNARD VII.** made himself known by his enterprise and audacity in southern France; but when the murder of Louis I., duke of Orleans, brother of Charles VI., by the emissaries of John the Fearless, duke of Burgundy, left the Orleanists without a chief, he married his daughter to young Charles of Orleans, and became the leader of the faction which henceforth assumed the name of Armagnac. He succeeded in seizing on Paris, which he governed with an iron rule. At last the Parisians became tired of his tyranny, and by treason delivered the city into the hands of L'Île-Adam, one of the Burgundian chiefs. Bernard hid himself for a while, but was finally betrayed by a mason, to whom he had confided, and was put into prison. A few days later, June, 1418, the jails were mobbed by the Burgundian populace, when all the Armagnacs were murdered, Bernard among the rest.—III. **JOHN V.**, son of John IV., born toward 1420, made himself notorious by the rashness of his uncontrollable passions, and even went so far as to marry his own sister, Jane Isabella, who had been engaged to King Henry VI. of England. This monstrous crime was made a pretext by Charles VII. for depriving him of his possessions, which were afterward restored to him by Louis XI. Notwithstanding this kindness, John entered the league of the public weal, and Louis resolved to take revenge on him. The count was obliged to seek a refuge in Aragon. A few years later, he succeeded again in regaining possession of his territory by entering into an alliance with the duke of Guyenne, the younger brother of Louis XI. The forbearance of the king was exhausted: he sent against the count the cardinal of Alby, who besieged John in the castle of Lectoure, forced him to surrender, and had him perfidiously murdered under the eyes of his own wife. The unfortunate woman herself being pregnant, was obliged to drink of a poison which killed both herself and her unborn child, 1478.

ARMAND, **CHARLES**, marquis de la Rouarie, a French officer, who served in the American army during the revolutionary war. He received the commission of colonel in May, 1777. In 1781 he went to France to obtain supplies, but returned in time to join the army at Yorktown. In 1783, at the solicitation of Washington, congress gave him the appointment of general of brigade. He afterward returned to his native country, and took part in the French revolution. He was present at the bloody massacres of La Vendée, but on hearing of the execution of Louis XVI. was completely overwhelmed; his health gave way, and he died Jan. 30, 1793.

ARMANSPERG, **JOSEPH LOUIS**, count von, president of the regency instituted over Greece, after her independence of Turkey was established, born Feb. 28, 1787, in Lower Bavaria, died April 8, 1858. He studied at the uni-

versity of Landshut, and in 1808 entered the civil service. In the wars of 1813, '14 he was commissioner of Bavaria in the allied army, and belonged to the board which governed the conquered regions on the Rhine. In 1815 he participated in the congress of Vienna, was one of the plenipotentiaries with the allied army during the occupation of France, and administered a large district of that country. From 1816 to 1828 he occupied various elevated offices in Bavaria, and gave proof of great activity, decision, and organizing capacity. In 1825 he was chosen president of the chamber of deputies, and became leader of the moderate opposition. King Louis, on ascending the throne, intrusted Armanesparg with projecting and carrying out various reforms, and finally made him his secretary of the treasury and of foreign affairs. He was one of the founders of the German Zollverein. He constantly cared for the material interests of his country, and for the advancement of the positive sciences. He was ever a stern opponent of the Catholics in Bavaria, both in the royal council and in the chambers. In this conflict he forfeited the confidence of the king, who was led to believe that Armanesparg aimed to make a tool of the sovereign. He then retired into private life, but was recalled by the king to take the regency of Greece during the minority of King Otho, according to the protocol signed May 7, 1832, in London, by the great powers. With his royal ward he landed in Nauplia toward the end of Jan. 1833. He was created chancellor of state, and ruled until 1837, with almost limitless power. His administration was in many respects beneficial, but he finally became unpopular with the nation, the sovereign, and the foreign diplomatists, then all-powerful in Athens, Sir Edmund Lyons, the English minister, alone excepted. He was dismissed in Feb. 1837, left Athens in March, returned to Bavaria, and retired to country life on his estates.

ARMATOLIO (Mod. Gr. *ἀρματολίον*, land of arms), the name given to 18, or, according to others, to 17 districts, situated amid the mountains of northern Greece, and subject each to the authority of an armatol. The armatols were Christian captains who, after the establishment of the Ottoman empire in Europe, succeeded in maintaining themselves independent in the possession of inaccessible mountain defiles. The armatolies of Macedonia, Epirus, and Thessaly, were the last refuge of the liberty and independence of old Greece, and they preserved, during centuries, the germ of the regeneration of the Hellenic nation. The warlike chiefs of these districts became more and more formidable to the Porte, and their bold attacks obliged the pashas, near the beginning of the 17th century, to treat with them, and upon condition of their peaceful conduct to allow their right to govern their mountain country. These advances encouraged the armatols, who daily increased in power, till under their direction the war of Greek independence broke out. Those

of the armatol chieftains who most distinguished themselves in this war, were Eustrates, the leader of 500 men; Zongas, killed in 1827 before Athens; Karaiskakas, leader of 600 men, and who perished under the walls of Athens; Kaltzodemos, killed before Missolonghi; Odysseus, Karatasso, and Marco Bozzaris, the commander of the Suliotes.

ARMENIA, a country occupying the north-east portion of Turkey in Asia, lying S. E. of the Black sea, having a trend of N. W. and S. E., with an angle of 45° from lat. 37° 30' to 41° 31' N., and comprising an area of 49,096 sq. m. Ancient Armenia was somewhat more extensive, though its boundaries, especially the western and southern, for lack of natural determinations, were in almost constant change during the political struggles of which it was the arena for nearly 3,000 years. Taken in a wide acceptance as to time, ancient Armenia may be bounded, or rather indicated, as extending from the eastern side of the Euphrates (until 190 B. C., a part of Armenia, known then as Armenia Minor, was on the west of the Euphrates; soon after the division it was absorbed into the neighboring states) to the Koordistan mountains, and from the Black sea to the Buhtan, which divided it from the country of the Karduchians. Thus indicated, Armenia includes the eastern basin of the Euphrates so far south as the modern town of Bir in Mesopotamia, the northern half of the valley of Tigris, the western slope of the Koordistan mountains, the entire basin of the Tchoruk, and the head-water valley of the Koor. It is an elevated table land (being part of the great plateau of Iran), supporting on the western slope of the Koordistan mountains the lake Van, at an elevation of 5,467 feet above the sea-level. It is well watered by 5 principal rivers (Euphrates, Tigris, Koor, Aras, and Tchoruk), and their tributaries, which find their way into the Black and Caspian seas, and the Persian gulf, traversed by 8 lofty chains of mountains (Bin Gheul, a branch of the Caucasian in the north, the Taurus in the south, and the Koordistan on the east), and interspersed with numerous lakes. In geological aspect it gives indications, by the trap and porphyritic composition of its mountains, and the evident volcanic character of the higher peaks, that it has been the subject of a mighty upheaval. Volcanic action is not yet extinct, an eruption of Ararat having occurred in 1840. Armenia abounds in silver, lead, iron, copper, rock salt, and mineral waters. Trap and porphyry are principally confined to the north—the salt formations are central. The principal lake is Van, which lies in a basin formed by the Koordistan, Karah, Amadias, and Taurus mountains, and has an area of 2,000 sq. m. The climate of Armenia is severe. Winter lasts from October to May, the summer is short and warm, and the transitions of temperature are abrupt. It is, nevertheless, generally regarded by travellers as a healthy region. Its agricultural resources are good, but a large portion of

the land is unimproved. It is best adapted to cereal products and grazing. Its principal cities are: 1. *Erzroum*, situated on the head-waters of the *Kara Su*, founded in 415, an important military station under the Byzantine emperors, and now under the Turks, and a halting place for caravans. Pop. 40,000. It is in the present pashalic of the same name. 2. *Kars*, situated in the pashalic of *Kars*, 100 miles east and north of *Erzroum*, on the head-waters of the *Aras*, and has a military importance. It was captured by the Russians in 1855, but was restored by treaty, soon after. Pop. 12,000. 3. *Moosh*, situated on the *Murad Ohai*, 88 miles south of *Erzroum*, in the pashalic of *Van*. It has some manufacturing importance, and is the seat of some western trade. Pop. 7,000. 4. *Bayazid*, situated in the north-east part of the pashalic of *Van*. Pop. 2,000. 5. *Van*, on the lake of the same name. *Van* has some importance from the manufacture of cotton fabrics, the raw cotton being imported from *Persia*. 6. *Batoum*, situated on the *Black sea*, near the mouth of the *Tchoruk*, in the pashalic of *Kars*. 7. *Bitlis*, on an affluent of the *Tigris*, in the pashalic of *Van*.—The Armenians call themselves *Haiks*, from *Haig*, whom they assign to the time of *Belus* (2200 B. C.), and consider a descendant of *Japhet*. They relate that *Haig* emigrated to Armenia on account of the oppressions of *Belus*. *Herodotus* considers the Armenians of Phrygian origin, *Strabo* of Thessalian. They derived the name of Armenians, or *Aramides*, from *Aram*, who lived about 800 years after *Haig*, and, by his warlike exploits, first gave his subjects political importance, and so a name. But they soon lost their political importance, under his son, and became tributary to Assyria, until the middle of the 8th century B. C., when they again became independent. This independence they maintained until 825 B. C., when they became subject to Macedonia for 180 years, and again (190 B. C.) free, availing themselves of a defeat of *Antiochus* the Great by the Romans. Armenia was now divided into Major and Minor Armenia, and governed respectively by two Armenian nobles, *Artaxias* and *Zariadras*. *Zariadras* soon lost the independence of Armenia Minor (in the fall of *Mithridates*); Armenia Major remained quietly under the government of the *Arsacidæ* until 84 B. C., from which time she became the subject and arena of perpetual struggles between the Romans and Persians, with various fortunes to herself, until A. D. 387, when, by compact between *Theodosius* and *Sapores*, the disputed territory was peacefully partitioned. Over eastern Armenia, *Sapores*, through motives of policy, appointed as viceroy a descendant of the *Arsacidæ*. But in less than 40 years this last vestige of independence passed away, and *Persia* now directed her energies to eradicate the Christian religion from her subjugated provinces, and substitute in its place the doctrines of *Zoroaster*, and then religious persecution added its weight to political oppression. But the dis-

tresses of Armenia did not end even here. From 682 she was the arena of a violent struggle between the Grecian and Mohammedan powers, till 857, when the Mohammedans obtained possession. Soon after, through the intrigues of *Ashdod*, commenced the *Bagratide* dynasty, which continued till 1079, when it was brought to a close by the assassination of the last prince of the line, and Armenia suffered a triple dismemberment to the Greeks, Turks, and *Koords*. An inconsiderable emigration afterward established a principality north of *Cilicia*, important only in history from the aid it rendered to the crusades, a century later. This principality was subjugated by the *Mamelukes* in the 14th century, and thus ends Armenian nationality. Since that time the Armenians have been simply plunder for any nation which has had a surplus of brute force to expend. Overrun by the Ottomans (1588), by the Persians (1604), Armenia has arrived at a second tripartite division to Russia, Turkey, and Persia. Of this division *Mount Ararat* is the departing point, the Russian power extending to the north and east, and forming her trans-Caucasian territory—the Persian to the east and south, over the province of *Arubijan*, and Turkey to the north and west, making the pashalics of *Erzroum*, *Trebizond*, *Van*, *Kars*, and *Diarbekir*.

ARMENIAN CHURCH. Though Christianity was known in Armenia so early as the 3d century, it was not until the 4th century that it may be regarded as having obtained a foothold. In 802 *Tiridates*, the last of the *Arsacidæ*, and many of the Armenian nobles, embraced the Christian faith, and in 319 he was confirmed as the pontiff of Armenia. Christianity thus became the established religion of the land. In theology the Armenian church was at first *Augustinian*, adopting the *Apostolic*, *Nicene*, and *Athanasian* creeds. Later in her history (6th century), *Monophysitic* views were introduced into Armenia by *Jacob Barodene*, which led to a schism in the church, the *Monophysitic* branch, which was the majority, of course separating themselves from the communion of the Roman church. The two parties were violently opposed to each other, though differing but slightly in opinion. The schismatics affirmed the absorption of the human nature of Christ into the divine—the procession of the Holy Ghost from the Father alone—redemption from original sin by the sacrifice of Christ—its appropriation by baptism—and redemption from actual sin by penance and auricular confession. They adhere to the 7 sacraments of the Roman church, perform baptism by a trine immersion, believe in the mediation of saints, the adoration of images and transubstantiation, and administer the holy communion in both kinds to laymen. They deny purgatorial penance, and yet think the prayers of the pious will help the souls of the departed. Their faith has evidently less of the ascetic than that of the conservative party. The religious dissensions, and more particularly the political op-

pressions of Armenia, have scattered the Armenian church in a second Jewish dispersion. But in church polity they are subject to a central Catholicos or patriarch. Since the Russian conquest of Eriwan, the Catholicos resides at Eriwan, is proposed by the archbishops from among their number, and is appointed by the emperor. There are seven degrees of the Armenian clergy: 1, the priesthood; 2, the archdeacons; 3, the subdeacons; 4, the torch-bearers; 5, the exorcists; 6, the readers; 7, the doorkeepers. The offices of these several ranks are sufficiently indicated by their titles. Owing to the lack of asceticism in the Armenian church, cloister life is not so frequent as under the Roman Catholic faith. The piety of the Armenian church has, for the last 100 years, taken a somewhat practical form of development, in the labors of the Mechitharists to circulate religious knowledge among the members of their communion, from their publishing establishment in the lagoons of Venice. The Mechitharists sprung more particularly from the conservative branch of the Armenian church. The labors of Protestant missionaries are also extending among them.

ARMENIAN LITERATURE. The Armenians, from the earliest period of their existence, through all the political disasters which have signalized their history, have always exhibited a strong love for a national literature, and a persistent tendency toward its development. Until A. D. 819, the Armenians were Parsees, at which time the Christian religion was introduced among them by Gregory the Illuminated. The literature of Armenia, until the introduction of Christianity, is contained in a few songs or ballads, which have been collected by Moses of Chorene, and Armenian civilization was only that which could be wrought out by the Zoroastrian philosophy. The new faith of the Armenians operated favorably and powerfully on their literature. At the epoch of the Christianity of Armenia, the Grecian language and learning were exciting the profoundest admiration and esteem of the eminent divines, and of the church generally. The attempt was making to bring the results of Grecian philosophy to the aid of Christian theology, as the fruit of which so many modifications crept into the popular faith. The natural result of this great attention to Greek literature was immediately manifest on the literary history of Armenia. A multitude of Grecian works were translated, commented upon, and their philosophy adopted. Thus, we may say that Armenian literature erected itself upon a Grecian basis. About this time the alphabet of 38 characters, in present use in the Armenian language, was invented by Mesrob, or, according to his own account, was received by him from heaven in a dream. In connection with its introduction the language naturally underwent many modifications both in orthography and syntax, and as a proof of the strong Grecian current that was setting in upon the Armenian mind, the language has re-

ceived its most marked features, syntactical and orthographical, from beyond the Archipelago. The ulterior purpose of Mesrob, in reducing the language to a new alphabet, was the publication of an Armenian Bible. This was commenced A. D. 411, and was the work of nearly half a century with Mesrob and his three sons, whom he had educated especially for the task. Many works were about this period translated from the Greek into the Armenian tongue. The completion of Mesrob's Bible gave a powerful impulse to Armenian learning, while it also stamped upon that learning a religious character which it has never lost. Then came the Monophysite doctrines into the Armenian church, through the missionaries of Julian of Halicarnassus, and the consequent separation of the Armenian Christians from the communion of the Greek church by the council of Chalcedon (451). From the 6th to the 10th century is the golden age of Armenian literature. The cause of its temporary decline at this period is to be found in the invasion of the Arabians in 855, when many of the inhabitants were converted to the Mohammedan faith, and many more compelled to suffer persecution for their refusal to abjure Christianity. For the next 200 years Armenia was the subject of a bitter contention between the Greeks and the Turks. But when after the fall of the Bagratide dynasty, and the subjugation of Armenia to the Greek empire, the new Armenian principality was established on the Mediterranean, literature again revived, and until the 14th century was in a thriving condition. At this epoch (1375) the territory of the new principality which had until that time been held by the Mamelukes, was wrested from them by the Ottomans, and the Armenians were again driven from their homes, and scattered, like the Jews, among the nations of the earth. From that time, the literature of the Armenians has almost steadily declined. After the migration, they established themselves in Russia, Germany, India, Asia Minor, Syria, and Egypt. Amid all the disadvantages of their position, they nevertheless preserve not only a great unity of religious faith, but the same unwearied desire to sustain a national literature. But it is at present limited to the somewhat unproductive though landable efforts of the Mechitharists, who (1700) established themselves on a lagoon in the Venetian gulf, where they have a printing press, from which, during the last century and a half, they have issued several translations of important religious works, such as those of Philo, Chrysostom, and St. Basil. The convent and printing establishment of these monks is on the island of San Lazaro. The monks are admirable scholars. They now publish a semi-monthly paper in the Armenian language, which is circulated and read among the scattered families of the Armenian faith. The articles for this paper are original, and written by the inmates of the institution. They are also from time to time translating and publishing the standard works of France,

Italy, England, and Germany. A recent traveller says that they print the Armenian creed, which differs little from that of the Roman church in 27 different languages, all in one volume. "I was not a little surprised," he says, "to find 'Uncle Tom's Cabin' translated by the young monk who showed us through the establishment. The library of this institution has some fine manuscripts and books. We were shown a manuscript copy of the scriptures in the Armenian language. It was most beautifully executed." (Edwards's "Random Sketches and Notes of European Travel.") The Armenian literature is not rich in poetry. A little sacred poetry is all it can boast. The Armenian language is by some writers set down as an original tongue, by others a mixed dialect from 4 languages, and so comparatively modern. It is lacking in euphony, owing to an abundance of consonants, deficient in distinctions of gender, redundant in case, inflections, and uses articles as suffixes, like the northern and less cultured languages. Byron studied the Armenian language in this convent at San Lazaro. His study, table, and chair, are shown to visitors. His teacher died in 1854.

ARMERO Y PENERANDA, FRANCISCO, a Spanish admiral and statesman, born in the beginning of the present century, commenced his naval career as midshipman in 1822. He was present at the 2d siege of Bilbao by the Carlists, during the civil war between them and the partisans of Queen Christina, and for his conduct on that occasion was promoted to the rank of lieutenant. He was soon after made captain, and raised to the command of the naval division of Catalonia. In 1840 he was minister of marine, and accompanied the queen regent and Queen Isabella to Valencia. After the events of Barcelona had compelled the queen regent to quit Spain, he retired from political life, but returned to it in 1848, and was minister of marine under the administration of Narvaez, and afterward under that of Isturitz. In 1848 he was appointed to the command of the Spanish squadron at Cuba. On his return to Spain, he took a place in the Bravo Murillo cabinet as minister of marine, but resigned the office a short time before the dissolution of the ministry. In 1855 he attained by seniority the rank of chief admiral of the fleet, and in 1857, on the retirement of Narvaez, became prime minister of Spain. His character for moderation, frankness, and integrity, and his eminent military and administrative services, have won him a high degree of respect in his native country.

ARMFELT. I. KARL GUSTAF, baron, a Swedish general, born Nov. 9, 1666, in Ingermanland, at that time a province of Sweden, died Oct. 20, 1738. As a young man he served in the army of France more than 12 years, greatly distinguishing himself by bravery. He took part, afterward, in the wars of Charles XII., served at Pultowa, and directed the heroic defence of Helsingfors against Peter the Great. He was at length defeated by Apraxin in the

battle of Stor-kyro, Feb. 15, 1714. He commanded an expedition against Norway in 1718, but was repulsed in endeavoring to capture Drontheim. After the death of Charles, he attempted to effect a retreat across the Norwegian mountains, during the severe winter of 1718-'19, and was overtaken by a storm, in which more than 600 of his men were frozen to death. Notwithstanding his repeated misfortunes, he was appointed, in 1725, commander-in-chief of the Finnish army. II. GUSTAF MORITZ, baron, a Swedish general, born at Fuva in Finland, in 1757, and died at Tsarskoe-Selo in 1814. He distinguished himself in the war against Russia, and was a great favorite with Gustavus III. He rose still higher in his favor by his efforts to weaken the power of the aristocratic party to which Gustavus was strenuously opposed, and by his honorable military career. Gustavus, before he died, not only appointed him governor of Stockholm, but also made a codicil to his will for the purpose of naming him member of the council of regency during the minority of Gustavus IV. But Gustavus had not sufficient strength left to sign his name in full to the codicil; he could only put his first initial to it. The duke of Södermannland who had been previously named in the will in connection with the regency, availed himself of the defective signature of the codicil, to repudiate it, and actually threw it into the fire. Nor was the duke contented with destroying the codicil and nullifying the nomination of the king; he could not forget the preference which had been shown to Armfelt. There was still another circumstance which was calculated to incense the duke against Armfelt. He was in love with a young noblewoman connected with the court of the name of Von Rudensköld, and had reason to believe that the young lady, far from loving him, was in love with another, and that other the same man who had alienated from him the good will of his king. The duke—who, during the minority of Gustavus IV., was omnipotent in Sweden—was bent on vengeance. He caused the young lady to be sent to the house of correction, while Armfelt was dismissed from his office of governor and removed to Naples, ostensibly as ambassador of Sweden at the Sicilian court, but really for the purpose of getting him out of the way and consummating his ruin during his absence. This was done by indicting him for treason, branding him as a criminal, confiscating his property, and by taking away from him his titles and his privileges as a nobleman. A requisition for his arrest was sent out to Naples, and it was even said that an attempt was made upon Armfelt's life by murderers in the pay of the duke. He succeeded in making his escape from Naples and proceeded to St. Petersburg, but, as he was not very favorably received by the Czar, he left Russia for Germany, where he remained until 1799, when, on the advent of Gustavus IV. to the throne, he was allowed to return to Stockholm, reinstated in his former position,

appointed minister to the court of Vienna, and in 1807 general of infantry. After having taken a leading part in the war in Pomerania, and in 1808 against Norway, he resigned his office, but intended to remain in Stockholm, when a liaison with the famous countess Piper involved him again in difficulties with the Swedish police. He put himself under the protection of the Russian ambassador, who induced him to enter the service of Russia. He was raised to the dignity of count by the Russian government, appointed chancellor of the university of Abo, member of the Russian senate, and president of the affairs of Finland, in which latter country he died. Though he possessed many eminent qualities, he would never have become so extensively known to fame if it had not been for the persecution to which he was for some time subjected.

ARMIANSKOI-BAZAR, or **BAZAR OF THE ARMIENIANS**, a town in the south of Russia, government of Taurida, on the principal road from Russia to the Crimea. Upward of 30,000 cart-loads of salt annually pass through it from the salt lakes of the Crimea for the supply of the south of Russia.

ARMIGER, in Roman antiquities, an armor-bearer. In England it is the Latin word for an esquire, as *miles* is for knight. All such are allowed to have a coat of arms.

ARMILLA, in Roman antiquity, a bracelet worn by Roman females and warriors, the former for ornament, the latter as rewards for distinguished services.—An ornament worn on the ancles by Africans and Asiatics; also the ring on the hinge of a door; also an anatomical term with the ancient anatomists, signifying the coverings of the 5 nerves of the brain.

ARMIN, **ROBERT**, an English player, author, and associate of Shakespeare. He was a member of Shakespeare's company of players, and his name appears in the original list of the performers of Shakespeare's plays, given in the first folio edition of his works. He translated a small Italian novel, the "Italian Taylor and his Boy," and wrote a dramatic piece entitled the "History of the Two Maids of More Clacke;" and he is alluded to by Nash in 1593 as a writer of stories and ballads. His only work which at present has either interest or value is entitled "A Nest of Ninnies, simply of themselves without compound. Stultorum plena sunt omnia. By Robert Armin, 1608." This tract is composed of dull anecdotes of the domestic fools and jesters of the time, and is interesting as showing something of the real life from which the great dramatist got the elements of the fools in his plays. Only a single copy of the original edition of this book remains, which is found in the Bodleian library. It was reprinted by the Shakespeare society in 1842.

ARMINIANS. The Arminian movement in theology may be regarded as antipodal to the Calvinistic. It takes its name from James Ar-

minius, but the doctrines of this theologian were more Lutheran, and less anti-Calvinistic than those of the Arminian party. It is difficult to trace the history of Arminianism correctly, it is so mixed up with the political and civil interests that were then occupying and disturbing the United Provinces, in their struggles with Spain. In a desperate juncture of their Spanish difficulties, the Netherlands had sent an embassy both to the French and English courts, and were about equally divided at home as to which of these powers they would offer the sovereignty of the provinces. The counsels for the English throne finally prevailed, and a deputation headed by Barneveldt, the grand pensionary, made a formal offer of the Netherlands to Elizabeth. The course pursued by the English court on this offer, divided the popular sentiment of the Netherlands into two great parties: the military, acting under Maurice the Stadtholder, the successor of William, and the civil, under Barneveldt. Barneveldt had early espoused the cause of Arminius, against the Gomarists (though himself personally more in sympathy with Gomarus), while Maurice, though an Arminian in sentiment, supported the Calvinistic theology. Thus did the theological forces of this movement lend themselves to political intrigues, and heighten the animosities of political strife with sectarian bitterness. Arminianism became identified with the cause of popular liberty, while Calvinism lent itself to Maurice, in the attempt to establish him as the sovereign of the provinces. The Arminian party drew up and presented to the states of Holland (1610) a remonstrance, and were consequently termed remonstrants. To accomplish his purpose, Maurice, who was sustained by the majority, bent his energies to securing the calling of a synod which should decide between the Calvinistic and Arminian parties, and was successful. The synod of Dort was convened for this purpose by the states-general, in 1618, nine years after the death of Arminius. At this synod, which was in session for 6 months, the Arminian cause was mainly defended by Simon Episcopius, though the Arminians were summarily expelled from the deliberations of the council, and allowed to appear only as an accused party. The Calvinistic party of course triumphed in a synod thus organized, the remonstrants were condemned, their preachers deposed, Barneveldt executed, Grotius imprisoned for life, and Calvinism declared the orthodox doctrine of the reformed church. The distinguishing tenets of the Dort Arminians may be set down thus: 1. The divine election grounds on a foreseen personal faith, in the elect. 2. Faith, and sincere (though not perfect) obedience the conditions of justification and salvation, as the perfect obedience of Adam would have justified and saved him, because Christ's satisfaction makes up the deficiency in our own obedience. 3. That on account of the redemption in Christ, none will be condemned for original sin. The Arminians were also called

Freewillers, and Semi-Pelagians, and later have been sometimes designated as Socinians, not without cause. It is at least true that many Socinians joined them. Arminianism is to be regarded only as a continuation of the anti-Nicene movement in theology, which commenced when theologians, no longer satisfied with asserting the existence of three persons in one God, first began to inquire into the mode of this existence. Though Episcopius defends himself against the charge of Socinianism, and Arminius was equally scandalized at being termed a Pelagian, yet this subordination of Arminianism to the Arian movement, in its widest sense, will be justified in the inevitable and organic sympathy historically exhibited between Arminianism and all the modified forms of the Arian faith. Pelagius and Augustine stood in the same attitude to each other in the 5th century, as Arminius and Calvin did 11 centuries later, and Calvinism was but a revival of Augustinism. In the Nestorian, Eutychian, and Monophysite controversies, the same organic sympathy is no less generally manifest, the Alexandrian school always being the champion of Augustinism and Trinitarianism, and the Antiochene espousing the cause of Arianism and Pelagianism. Every new phase of Arianism, to this day, is infallibly Arminian, though the organic connection of the two is not so manifest from the distinctively Arminian side, at least in modern times. The large and powerful body of Methodists, both in this country and Europe, are Arminians, and yet Trinitarians, as truly as the Calvinistic or Augustinian branch of Protestantism. Arminianism has not spread in Germany (at least, until very recently, under the auspices of the Methodist missionary society), owing to the prevalent religious philosophy of that country being more favorable to the Calvinistic theology. The English church, since the time of Laud, may be considered as inclining to the Arminian side. In their forms of government the Arminian churches are generally Episcopal.

ARMINIUS, or HERMANN, JAMES, born in Oudewater, South Holland, in 1560, died in 1609. Left an orphan in infancy, he was adopted by *Æmilius*, a clergyman, and later by *Snellius*. In his collegiate studies at Leyden, he distinguished himself for theological learning. Going thence to Geneva, he maintained the same reputation, under the tuition of Beza, but became an object of suspicion to the university on account of his adherence to the philosophy of Ramus, an opponent of the predominant Aristotelianism of Geneva. He therefore retired to Basel, which university offered him the degree of D. D. when he was 23 years old. He declined the honor, saying that "for so young a face to bear that honored degree would diminish its dignity." He next went to Padua, to attend the lectures of Zabarella, and on his return to Amsterdam (1588) was received into the ministry, and appointed over the church of that place. Amsterdam was the

field of those mental conflicts through which Arminius attained the religious views that gave fame to his name and bitterness to his life. The Calvinistic doctrine of predestination had been attacked, and the church desired that Arminius should defend it, and also sustain the views of Beza against the intralapsarians of Delft. He undertook the task, but before its completion he had travelled all the way from the predestination of Calvin to the free grace of Arminius, and had entered upon the stormy sea of opposition to the dominant faith of the times. Nevertheless, because he rejected Pelagianism, he was chosen, though reluctantly, professor at Leyden (1608) to fill the chair of theology vacated by the death of *Gunius*. But he soon excited great opposition on account of his doctrines, as may be seen by the anagrams, which, after the custom of the times, were constructed on his name. He also opposed the requisition that the preachers should annually sign a pledge to abide by the doctrines of the confession and the catechism. This brought down upon him a storm of persecution from a set of zealots in Holland, who urged the measure. In the pulpit he was plain, persuasive, and forcible in argument, with something of acerbity both in his public and private life, probably less constitutional than the result of the strifes in which his sentiments involved him, in an age when theological dogmas were so violently discussed. The personal religious faith of Arminius is to be distinguished from that of the theological school to which he has given his name. Nor is he to be regarded as in any special sense the originator of the Arminian movement in theology. His views more nearly coincided with those of Melancthon. The faith of Arminianism was more distinctly defined by Episcopius at the synod of Dort, 9 years after the death of Arminius.

ARMINIUS, in German HERMANN, prince of the Cherusci, a German tribe, and the liberator of Germany, born about 16 B. C. At that time the Romans were more and more extending their dominion over Germany, penetrating into the interior, constructing military roads and fortified camps, subduing some tribes, and making others their allies. Many of the Germans willingly entered the Roman military service, and acquired Roman culture, customs, and manners. Among these were Arminius and his brother Flavius, who served the Romans on the Danube as leaders of an auxiliary body of the Cherusci. Arminius thus became a Roman citizen of the equestrian order, and mastered the Latin language, Roman military tactics, and policy. Returning after several years to his country, he found it smarting under the iron rule and the exactions of Varus, a Roman governor, who among other oppressions obliged the Germans to submit to the Roman civil law and to conduct their private litigations before Roman judges and through Roman advocates. He determined to liberate his country, and, if possible, to exterminate the oppressors, whose

forces numbered about 50,000 men. He organized an extensive conspiracy, and used the confidence placed in him by Varus to distribute several small detachments of Roman soldiers among different tribes, under the plea of maintaining better order among the Germans. He also prevailed upon Varus to change the direction of his march with the main body on the way to his winter-quarters on the Rhine. Thus Varus was enticed toward the Teutoburg forest, now partly the principality of Lippe and partly Prussian territory. Arminius, who accompanied him on this march, suddenly disappeared and gave the signal for insurrection. The Romans scattered in the interior were murdered, and the main body found itself surrounded on all sides by infuriated masses, among primitive forests, marshes, mountain passes, and impassable rivers. The Romans fought their way for 8 days, until almost all were exterminated, Varus himself taking his own life. From among the prisoners, the chiefs, civil and military, were sacrificed to the gods, the rest enslaved. The Germans bored holes in the tongues of the Roman lawyers and judges, saying to them, "Now rattle away." This was the famous destruction of the Roman legions which filled the eternal city and Augustus its master with grief and shame. For several days Augustus would only utter the words, "Varus, give me back my legions!" Germanicus, however, marched from Gaul to avenge the fallen, and entered Germany, but returned, after a short campaign, the same year. Among the Germans dissensions soon prevailed. Arminius carried off Thusnelda—celebrated afterward in German minstrelsy—daughter of Segestus, and married her, but she soon fell again into the hands of her father. Next year Germanicus entered with fresh troops, relieved Segestus, who was besieged by Arminius, and liberated him, but the pregnant Thusnelda was made a Roman slave. Arminius now called the Cherusci and other tribes to arms. Germanicus marched against him with 80,000 men and a large fleet on the Weser and in the Ems. He reached the spot where lay the whitening bones of the legions of Varus, and buried them with military honors. Arminius retreated until he had drawn the Romans into narrow passes, and then attacked them with such fury that Germanicus, having lost his cavalry, was obliged to retreat with great danger, and reached his vessels with difficulty; 4 legions under Cossina scarcely escaped total destruction previous to crossing the Rhine. The next spring Germanicus returned with an army of 100,000 men and about 1,000 vessels on the rivers. Beyond the Weser in Westphalia, between the present town of Hamelin and Rinteln, on a plain called the Woman's meadow, was fought the greatest battle between the Germans and Romans. The Germans were beaten, but nevertheless renewed the struggle next day, and obliged the victorious Romans to retreat. This was the last time that Roman armies invaded Germany beyond the

Rhine, and Arminius is therefore justly called the liberator. According to a legend, he disappeared in a mysterious manner during an interview on a half-built bridge with his brother Flavius, who remained attached to the Romans and tried to persuade his brother to return to them. But history says that Arminius, being proclaimed chief by the Cherusci and numerous other tribes, attacked Marbod the chief of the Marcomanni—an aggregate of various tribes in the east of Germany and on the Danube—his rival in pretensions to supreme power, who was supported by Inguiomar, the uncle of Arminius. After a violent and terrible struggle, whose theatre was Saxony, and a great undecided battle, Marbod was abandoned by many of his partisans, returned again to Bohemia, and finally fled to the Romans, leaving Arminius in undisputed possession. For having attempted to exercise his authority as strictly in peace as in war, a conspiracy was organized against him, and he perished by the treachery of one of his relations at the age of 37. Thusnelda, the wife of Arminius, their son Thumelicus, born in captivity, and Sigismund brother of Thusnelda, appeared as prisoners in the triumphal cortège of Germanicus in Rome, A. D. 16. The lineage of the Cheruscan princes was extinct, with the exception of Italicus son of Flavius, brother of Arminius, who in the year 47 was given up by the Romans to the Cherusci at their request. Tacitus says that the name of Arminius was alive in the songs of the "barbarians of his time," and so it is still. It was the theme of many inflaming patriotic songs during the rising of Germany in 1813, '14, against the domination of Napoleon.

ARMISTEAD, W. K., brevet brigadier-general in the U. S. army, and for many years chief of the corps of engineers, born in 1780, died at Upperville, Va., Oct. 13, 1845. He entered the army at 18, and throughout his military career was conspicuous for his devotion to duty and for high moral worth. In the campaign of 1840, '41, he commanded the U. S. troops in Florida.

ARMOR, a defensive covering for the head, limbs, and body, used as a protection in battle. The use of armor is almost as old as history itself, and appears to be of almost universal occurrence, among all tribes and peoples, savage, barbarous, or civilized, among whom war is one of the conditions of life, while fire-arms have not prevailed to such a degree as to render defences of that nature useless. It has been asserted by superficial writers, more given to turning antithetical periods than to ascertaining facts, that the earliest forms of defensive armor were the skins of wild beasts; and many pleasing paragraphs have been penned, representing that armor, after travelling through a complete circle, from the lion's hide of Hercules to the complete plate panoply of the 14th century, had returned to its starting point and original type, in the buffcoat of the troopers of the Commonwealth, and of the times of Charles XII.

But of this there is no proof, nor indeed are there any reasons for believing such to be the case, except that the base of the ancient shield, as to this day it is among savage nations, was hardened bull's hide. The lion skin of Hercules is never described in the classics as armor, but as a cloak or robe of military honor, worn either without the armor, or above it, as by the heroes of the Iliad; while the adaptation of the heads of wild beasts, wolves, and boars, especially, to the covering of casques, was clearly a matter of decoration, worn in *terrorum*, and not of defence, like the leopard skin helmet-covers of the French dragoons of the present day, or the bear-skin crests of the English life-guards. On the contrary, from all historic evidence, we find that, from the times of the Old Testament to the fall of the Roman empire, bronze, or brass, as it is usually termed, was the material of the helmets and body armor of all the principal nations of antiquity, their shields and bucklers being variously manufactured of many folds of bull's hide bound and embossed with brass; of thin planks covered with leather, and similarly bound with brass or iron and studded; of wicker-work sheathed with wild beasts' hairy hides; or of solid metal, usually Corinthian bronze. The first form was that of the heroic buckler of Homer, covering the champion from his chin to his anoles; the second, that of the oblong and externally convex shield of the legions; the third, that of the small shields of many of the oriental nations; the fourth, that of the round bronze targe of the Hellenic and Macedonian phalanx, of which those of the best quality were manufactured at Argos. —The use of iron or steel, whether for defensive or offensive arms, is comparatively recent; and it would appear that, while the ancients possessed, like the Mexicans when first discovered, the secret of tempering and hardening copper, or bronze, so that it would repel a sword-blow or pike-thrust without bending, and even carry a cutting edge, which modern skill and science cannot effect, they had not the knowledge how to temper steel. *Æschylus*, it is true, mentions steel (*chalybs*) as synonymous with the sword; but he qualifies the use by terming it "the Scythian stranger," thereby indicating its foreign origin and its little use in Greece, where, until a much later period, sword blades and spear heads were made of copper or bronze, not of steel or iron. —So lately even as the destruction of Pompeii, surgical instruments, scalpels, knives, and lancets, varying but little from the modern form, were made of bronze, as is clearly shown by the specimens recovered from the excavations. The Romans, however, at an early date, used steel for their weapons, probably introduced from Spain, although bronze was, to the last, the material of their helmets, breastplates, and greaves, many of which are still extant of rare beauty of workmanship, and—though of insignificant thickness, as compared with the knightly armor of the middle ages—perfectly competent to re-

sist a shrewd broadsword blow, or the dint of an arrow or javelin.—The first description of a complete panoply is to be found in the first book of *Samuel*, chap. xvii, in the account of Goliath, the champion of the Philistines, or Phœnicians of the Syrian coast. "He had an helmet of brass upon his head, and he was armed with a coat of mail, and the weight of the coat was 5,000 shekels of brass; and he had greaves of brass upon his legs, and a target of brass upon his shoulders, and the staff of his spear was like a weaver's beam, and his spearhead weighed 600 shekels of iron; and one bearing a shield went before him." The description above is almost identical with that given by Homer of the armature of the Greek and Trojan leaders, before Ilium, with the exception—which is undoubtedly an error in the translation—of the coat of mail; since mail, or chain-armor, was unknown to the ancients, and only came into use, with the use of wrought steel, when the northern tribes of Europe descended upon the Latin countries of the South. The earliest, as the latest, armor of Europe was plate armor; although scale armor, which has often been confounded with mail, was introduced among them from the eastern barbarians, among whom it is still, in some degree, in use. The armor of a Hellenic chief of Homer's time consisted of a high crested helmet, which could on occasion be drawn over the face, after the fashion of a knight's vizor—a short breastplate covering the chest from below the collar-bones to below the ribs, but leaving all the vital parts of the neck and clavicular region, as well as the arms, exposed; a plated waist-band worn below the breastplate, protecting flanks and belly; and, lastly, a kilt, or short petticoat, descending nearly to the knee, of cloth or leather, covered by narrow, contiguous, though separate strips, of metallic plates, or scales, hinged one upon the other, so as to fall loosely and yield to every motion of the limbs, yet to afford full protection against a cross cut, and some defence against a direct thrust. To these was added the large circular shield, covering the whole man, and the greaves of bronze, beautifully moulded to the form of the legs, and sometimes covering the knee.—The same form was continued, with little change, among the Peloponnesian, Athenian, and Macedonian soldiery of the phalanx, whose array when drawn up in line, according to *Xenophon*, "lightened with brass, and bloomed with crimson." The Roman soldiery of the legions, to the very end of the empire, retained the same armor, still offering no protection to the throat, the upper portion of the chest, or the arms, all of which they were trained to protect by means of the oblong buckler. And this their open order and peculiar mode of fighting, every man hand to hand, as if in single combat, with the soldier opposed to him, singularly qualified them to do. The Romans, however, in later days rejected the greaves, at least for their infantry, and went into action with the legs bare and

the feet only protected by the military shoe, from which one of their emperors, Caligula, had his name.—This form of defensive armor continued until the very last days of the Roman empire, even when the seat of government was transferred to Constantinople; and to the times when the crusaders, sheathed from head to heel in chain mail, regarded with equal wonder and contempt the Protospathaires and other military officers of the degenerate Cæsars, as recorded by Anna Comnena, clad in the precise equipments which are still to be seen in the bas-reliefs of Trajan's column.—The oriental nations in the mean time had adopted much more complete, as well as more perfect, suits of armor, which seem to have been mostly made of overlapping scales, sewed upon leathern dresses, accurately fitting the shape, and covering the whole carcase and limbs of the horse as well as of the rider; and this, which is said to have been especially the style of the Sarmatians, was ultimately adopted by all the heavy cavalry (*cataphracts*) of the enemies, and at times the mercenary allies of Rome.—Throughout the western provinces of the Roman empire the same arms, offensive and defensive, were adopted; and even the first Anglo-Saxon conquerors of England were equipped and armed very similarly to the legionary soldiers. But when the vikings and sea-pirates of the North came down on the provinces, of late emancipated from the declining empire, and left to their own defence and their own devices, far other arms and weapons were introduced. Conical helmets of wrought steel, with curious shirts of a sort of primitive mail, not composed of intertwisted links, but of stout single rings, set edgewise, perpendicularly, in close contact, each to the next, upon shirts or jackets of elk or bison hide, to which they were strongly sewed, so as to cover the whole surface of the leather, and to offer to a blow the outer edges of a series of connected rings, formed their body armor. Round targets of wrought steel, with bosses and spikes in the centre, protected their left arms; and their offensive weapons were steel crossbows, heavy two-edged cutting swords, and ponderous glaives, bills, or battle-axes, as they were indiscriminately called, with the addition of short, heavy javelins, in the use of which they were great proficient. Such was the later armor of the Anglo-Saxons of England, and with such they fought, within a few days, victoriously against Harald Hardrada, at Stamford in Yorkshire, and at Hastings, to their utter discomfiture, against the Norman chivalry of William the Bastard. These men, of originally cognate origin, wore arms of somewhat kindred device, though modified in accordance with circumstances, and adapted to the use of cavalry, instead of footmen and searovers. They wore the same conical steel caps; but these were now fitted with what was called a nasal, being a perpendicular steel bar descending from the cap, so as to protect the nose. They had long shirts, which might almost be

called gowns, falling down to the mid leg, but parted before and behind so as to hang on each side the horse and protect the thighs, made of a linked texture, of small steel rings, intricately woven into one another, precisely after the manner of a modern curb-chain. These shirts, technically known as hauberks (Fr. *haubert*, Ital. *hobergo*) had long sleeves, reaching to the wrists; and, with them, were worn hose of the same material, with feet like those of modern stockings, reaching up to the girdle, where they were secured, so that the whole man was covered with a perfect web of flexible but impenetrable steel network. The shield was what is technically called heater-shaped, being exactly in the form of a modern smoothing iron; it was worn hung about the neck, with the broad side of the triangle upward, so as to protect the chest when the knight charged with the lance on horseback; and on the left arm, when he fought sword in hand. The weapons offensive of these formidable warriors were long steel-pointed lances, and straight two-edged, but not as yet two-handed, swords for the cavalry; long bows and short swords, or rather large knives for the infantry, who were armed in the same manner, although in a lighter fashion than the men-at-arms. As the mail, although it could not be easily cut through or pierced by lance-point or sword-edge, could be beat in, since it was perfectly pliable and resisted by yielding rather than by sustaining, and could therefore afford no defence from terrible bruises and contusions, the wearer was obliged to swathe himself in thick casings, 2 or 3 in number, of coarse woollen stuff, and to wear, above those, but still under the mail, a coat of buff leather of elk's or bull's hide, sufficient in itself to resist a sabre cut. This inconvenience, and the fact that, so soon as the vast espaldrons, or double-handed swords, with blades 4 feet in length were introduced, the mail itself was liable to be cleft asunder, as it was to be smashed to pieces by the contusing blows of mace or battle-axe, led to the introduction of plate armor. But this improvement crept in slowly and gradually. The first addition was the square-topped helmet of the Templars, covering the whole face, with a sort of door opening laterally on hinges, but not capable of being opened at the will of the wearer, like the *avantaille* and beaver of later days. Then poldrons, or plates covering the shoulders, genouilleres, or knee-pieces, of jointed steel splints, and plate shoes, were added to the mail; and this was the suit of armor, of the best and most approved construction, so late as to the time of the third crusade of Richard Cœur de Lion and Philip Augustus, A. D. 1189, both of which monarchs are represented, in their great seals, equipped and armed exactly as described. The horses, at this period, were accoutred only with chamfrons of steel, protecting their foreheads, often armed with a spike, like the horn of a unicorn; and with a poytreil or breast-cloth of chain mail attached

to the bows of the saddle and falling down over the chest of the animal.—The next change was characterized by a mixture of two styles, such as we find in the armor of the time of Edward II. when the hauberk and chausses, or hose, are nearly covered with the different pieces of wrought-iron, and the shoulders and elbows have similar defences. Overlapping plates for the gauntlets, with small steel knobs or spikes, called gads, for the knuckles, appeared soon after; and by the reign of Richard II. the transformation was so far completed that only the camail—probably corrupted from cap-mail—the part which hung from the head over the neck and shoulders, the gussets at the joints, and the bottom of the apron, could be seen of the entire suit of ringed mail, worn at the beginning of the century. The splendor of the armor had also become as much a matter of attention as its construction; so that a new danger resulted to the owner of any peculiarly fine suit. Froissart records the case of Raymond, a nephew of Pope Clement, “who was taken prisoner, but afterward put to death for his beautiful armor.” Ailettes or small wings were attached to the back of the shoulders in one reign, the vizored *baçinet* was enriched with wreaths or bands in another; while, in a third, that of Henry V., by which time the knight was cased in complete steel from head to foot, the graceful *parache* or plume of feathers is sometimes seen surmounting the casque, and giving a new air to the dress and to its wearer; while the crested helmet, now only worn at tournaments, grows more and more magnificent.—From this date, commencing with the reign of Henry VI., there is preserved in the tower of London an unbroken series of specimens of the armor of every reign, extending down to that of James II., with whose time the use of complete armor may be said to have completely ceased. Three of these suits, those of Henry VI., Edward IV., and Henry VII., in whose time defensive armor had reached its utmost perfection, are especially worthy of notice, as portraying the improvement and completion of the equipment of man and horse. In addition to the evident magnificence and security of the dress of Henry VI., there is one particular feature only perceptible on a close examination. The back and breast plates are composed of several pieces each, so as to make the whole flexible. It was for a long time a matter of much difficulty to understand how a knight equipped himself; till Sir Samuel Meyrick, by the aid of an old document, solved the enigma. According to him, the procedure was as follows: The sleeves and shirt of mail would be first put on; then the long-pointed *sollerets*, or overlapping pieces of steel for the defence of the feet, with the formidable spurs screwed into them; then the greaves for the legs and the cuisses for the thighs. The breast-plate would be next adjusted to the body, to which the *tuillettes*, those overlapping pieces which hang from the waist over the hips, would

be fastened by their straps. The *van-braces*, or defences of the forepart of the arm, and the rear-braces, for the remainder of the arm up to the shoulder, would follow. The neck, head, and hands, now alone remain undefended. The camail is hung on the neck, the *salade* or sallet, a new German head-piece, characterized by a peculiar projection behind, over which is the rich-looking knight's cap and kingly device, is put upon the head; and the beautifully wrought gauntlets on the hands and wrists. The effigy of Henry VI. bears his pole-axe, a weapon of German origin, in his hands; and, if he had not a martial heart, he has at least in his armor, as he sits on his horse in the royal armory, a very martial exterior. In the next armor, that of Edward VI., there are considerable changes and improvements; the leg-pieces end a little above the ancles, and instead of *sollerets* appear slipper stirrups. Three entirely new pieces are added to the armor. The *grande garde*, a large piece of steel fastened over the left side of the breastplate, a sort of substitute for the shield—the *garde de bras*, a peculiarly shaped piece of armor covering the arm above the elbow, and lastly the *volant* piece, which is an extraordinary projection, acutely angular in front and advancing sharply forward, attached to the upper rim of the breastplate, and covering the whole face and helmet, up to the very brows, when the head is lowered. It was so perfect a protection, and so difficult to attain, or hit with the lance-point, that it was often disused by agreement, in tournaments. The wearer could only see over it, by throwing his head as far backward as possible, so as to bring his eyes above its upper rim. In real action, it must have been wholly useless; since the wearer must have fought in it blind and darkling, and, if safe himself, could work no evil to his antagonist. In the suit of Henry VII., the victor of Bosworth field, the perfection of armor is attained. The whole suit is fluted; the neck is defended by pass guards, rising perpendicularly from the shoulders; the helmet assumes a natural form; the back of the neck is protected by flexible plates; and the whole of the head-piece is made to adapt itself to every movement. The horse's head is still guarded by the *chamfront*, to which is added the *manifaire*, protecting the crest and arch of the neck, the *poitrel* of solid plates covering the counter, and the *croupier*, also of solid steel, extending over the whole rump of the animal from the castle of the saddle to the tail. These parts of the horse armor constitute what is called the *barding* proper. It is in this reign that the art of defence had so far surpassed the means of offence that it is on record, that in Italy, where the best armor, that of Milan, was made, two armies fought from 9 in the morning until 4 in the afternoon, in which battle not only no person was killed, but no one was wounded. From this date, however, the use of armor has constantly declined. In the reign of Henry VIII., the rolling musketry of the Spanish infantry, at

Pavia, annihilated the French gendarmerie; and cavalry thenceforth ceased to be the most efficient arm of battle. During the wars of the commonwealth, in England, and of the Low Countries, armor fell more and more into abeyance, as musketry and ordnance improved so rapidly that actions came to be decided at a distance, and the best and bravest of troops rarely, or never, came hand to hand. At the commencement of the present century the only troops who still wore defensive armor, were the heavy cavalry of the Austrian, Russian, and French imperial armies, who were all cuirassiers. Napoleon I. made great use of this arm, and generally decided his victories by a crushing charge of his steel-clad horse. But it is very doubtful whether the cuirass is of real utility, and whether it does not detract more from the mobility and free action of the trooper than it adds to his security, or weight in the onset. At Waterloo the iron-sheathed cuirassiers went down, like grass, before the superior weight of the men and horses of the English household troops, who wore no armor; and, in the last tremendous battles of the Crimea, although there were cuirassiers in the armies of all the 3 belligerents, no use was made of them in the field. With the present tenfold increased efficiency of small arms, by the introduction of the Minié bullet, the advantage and use of armor, even for cavalry, may probably be held to be extinguished for evermore.

ARMORICA, the name anciently given to the north-west coast of Gaul, from the Loire to the Seine. It had a considerable fleet and carried on a large intercourse with Britain. Maximus, a Roman officer, having revolted with the legions of Britain against the emperor Gratian, 383 B. C., passed into Gaul with 2 Roman legions and a number of aboriginal Britons, among whom was one Conan Mariadec, to whom Maximus gave the government of Armorica. Mariadec obtained the recognition of his independence from the emperor Theodosius, and in the 5th century thousands of British Celts came over, rather than remain under the hated Saxon yoke. They found in Armorica a hospitable reception, and a dynasty akin to them in race. The descendants of Conan Mariadec successfully repelled the Danish, Norwegian, and Irish pirates from the coasts of Armorica, and also, on the land side, the various German tribes who invaded and ravaged Gaul. During the 5th and 6th centuries it was the most peaceful and prosperous part of that country. The Christian religion was early propagated there. Bishops of Dol, Quimper, and Vannes, are recorded at the end of the 4th century, and the annals of Armorica preserve a long roll of Celtic saints whose names are not known elsewhere. In consequence of the influx of Britons about the 6th century, Armorica began to be called Bretagne.

ARMS, instruments or weapons of offence, as opposed to defensive armor. Arms may, in this sense, be separated into 2 broad divisions of

ancient and modern, reckoning the latter from the adaptation of gunpowder to purposes of war; and each of these may be again distinguished into missiles and weapons for hand to hand encounter. It stands to reason that offensive arms were prior in their invention and use to defensive coverings, since the latter could be of no utility except against the effect of the former. It is probable, also, that missiles were prior, in point of time, to weapons for close fight, inasmuch as nature furnishes every animal, more or less, with the means of attack and defence at close quarters, but gives no means for striking or capturing a distant enemy or object of pursuit, until he be first overtaken by superior speed of foot. Furthermore, in the East, to which all evidences point as the cradle of civilized man, missile weapons have always prevailed from the earliest periods of history to the present day. The bow and the javelin were, as history tells us, and as we see confirmed by the wonderful and wonderfully preserved sculptures of Nineveh, in Scriptural ages, the favorite weapons of the Parthians, Persians, Assyrians, Medes, and other Oriental races; while their instruments for close fight were merely weak, straight daggers, *acinares*, which word has been falsely translated scymitars. In the heroic wars, as described by Homer, missiles were still, in the hands of the chiefs and heroes, at least, the principal weapons; a ponderous spear, hurled from the hand, and rarely, if ever, used to thrust with as a pike, being the instrument which decided nearly all the duels of the champions, although, at times, they had recourse to their short swords, and even to heavy stones cast from the hand. The masses, indeed, would seem to have fought in phalanx or close column with the long standing pike, held fast in both hands. The bow and sling had, evidently, as little weight in deciding the fate of battles as they had favor in the eyes of the aristocratic leaders of the day. This prejudice continued, on the part of the Greeks, nearly to the end of their polity, the bow being hardly considered a fitting weapon for a freeman, and its use being mostly attributed to slaves, mercenary or tributary allies, or to proletarians of the poorest and lowest degree. The arm of the free Greeks of the republican cities, and afterward of the Macedonian and barbaric kingdoms of upper Hellas, was emphatically the pike, or *sarissa*, of 24 feet in length, which they charged in both hands, having their persons obliquely covered by the great round shield worn upon the left arm. The tactic on which the success of this arm depended was a closely serried column, ordinarily of 12 or 24, but occasionally of 50, files in depth. So long as the phalanx held its front unbroken, its close array of spear points was impenetrable and bore down every foe whom it encountered front to front; but it was an unwieldy body, liable to be thrown into disorder by an attack on the flanks or in the rear, and, when once thrown out of its order, so that an enemy could get within the heads of the long pikes, it was

invariably and easily routed, since the weak, short swords which the men carried in addition to their pikes, were not weapons to do powerful execution, and such as they were, the Greeks had neither use nor confidence in them, their whole discipline and drilling being directed to, and dependent on, the pike. The weapons of the Romans, on the contrary, were a short, massive javelin, 6 feet in length, including the triangular steel head of 18 inches, which they were wont to hurl into the lines of their enemy at 10 or 15 paces distant, when no shield; however stout, or breastplate, however finely tempered, could resist its brunt, and a short two-edged broadsword, probably, in the first instance, of Spanish origin and manufacture. This latter instrument, with which they were trained to stab rather than to strike, as by so doing they inflicted the deadliest wounds on their enemies' persons with the least exposure of their own, was that with which Rome cut her way to universal empire. Her tactic, adapted to its use, was a loose array of open lines, each man standing 8 feet from his right and left hand comrades, so that he had a clear space of 6 feet in which to manage his sword and buckler, and fighting, as it were, a duel or single combat, hand to hand, with his immediate opponent, over whom his peculiar weapon, his singular skill in its use, and his incessant drilling to athletic exercises of all sorts, gave him immense advantage. With the Greeks and Romans infantry was the front and principal feature of their armies. In cavalry they were ever weak, and archery and slingers they contemptuously disregarded. But with the decline of the Roman empires, especially that of the East, a new arm of the service took the lead, and the steel-clad cavalry of the middle ages for many a year carried all before them; infantry, with but two exceptions, the English and the Swiss, being utterly powerless against their overwhelming charge. The arms of these feudal men-at-arms were the lance, the mace, the battle-axe, and the two-handed sword; but it is the first to which they owed their prodigious success, it being, to them, what the sarissa was to the Greek footman of the phalanx. It was a huge and ponderous weapon of nearly 18 feet in length, balanced by the great weight of its butt-end, which was often nearly a foot in diameter, at 20 inches from the extremity, having a notch cut out to admit the upper arm of the champion, which steadied it as it was laid in rest, supported by a projecting iron catch attached to the right hand side of the knight's corselet. With this prodigious weapon, protruding 10 feet beyond their horse's chest, sheathed in panoply, which defied any missiles which in that day could be brought against it, with the sole exception of the English cloth-yard arrow, and charging like a whirlwind through the ranks of their ill-armed and ill-prepared antagonists, no infantry could resist their shock. Only when their front was protected by a *cheval de frise* of steel-shod palisades, and their

flanks secured by horse, the English archers with their fatal longbows, of 6 feet in length, and their cloth-yard arrows (see ARCHERY), shot them down through plate and mail, as if they were naked men, and invariably won the field, unless, when failing to defend their front with pikes, or secure their flanks, the mail-clad cavalry broke into their lines, when the axe and mace and two-handed sword made short work of them. The other arms of the infantry of this time were the bills—something similar to a short heavy scythe-blade set erect on a shaft 4 feet long—lead mallets and long knives of the Anglo-Norman archers—the pikes and halberts of the Swiss, which won them the bloody day of Sempach, and did them yeoman service at Morat, Granson, and Nancy, when the Austrian and Burgundian chivalry had dismounted,—the crossbows of the Genoese, and the serried spears of the Scottish foot, who fought like the Greeks in phalanx. From the battle of Hastings to that of Pavia, the lance was the queen of weapons; nothing could resist its levelled charge, and, until gunpowder, the grave of chivalry, was brought into the field, it rendered the aristocratic *gendarmes* invincible in the shock of battle. But at that battle, fatal to Francis, and to the flower of his kingdom's chivalry, musketry, so far improved, though the weapon was still but an imperfect matchlock arquebuse fired from a rest, as to be able to sustain a rolling fire of volleys, assumed the lead in military matters, which seems now by the most recent inventions to be secured to it forever. After Pavia, the reign of feudalism and charging chivalry was over; and, although the musket was not yet sufficiently certain in its aim, or effective in its range and penetration, but that the English longbow, yet for a while, contended with it for the palm, from that day infantry reassumed the precedence, has ever since composed the bulk of modern armies, stood the brunt of battles, fixed the scale of victory, and only called in the aid of cavalry to complete the route of disordered and discomfited antagonists, or if itself forced to retire before overwhelming forces, to cover its retreat from assailants, whose pursuit if rapid must throw them into disorder, and expose them to be charged by horse, while in confusion. It has long been known that horse, however strong or well led, cannot break steady infantry, armed even with the pike alone, when in square, and recent events have shown that with the improved fire-arms of the modern day, they can be successfully resisted in line.—For a long time the progress and improvement of fire-arms was extremely slow. The range was small, the accuracy of aim imperfect, and, till the musket was combined with the bayonet, the musketeer had no means of defence in his own person either as against charging horse, or as against infantry with long weapons, at close quarters. During this period, therefore, the pike again rose in favor, and, for a long time, pikes lined with musketry were the arms of the

choice troops of all armies in the world, and the main agents in winning all the great victories of their day. Such were the famous Spanish infantry, known, in the bloody wars of the Netherlandish persecutions, as the old bands of Castile; such the Swedish blue and yellow battalions of Gustavus Adolphus, the Protestant lion of the north; such the invincible legions of Wallenstein and Tilly and their contemporaries of the 30 years' war. Meantime, the bayonet was added to the arquebuse or musket, which had become from a matchlock a flintlock, and thus united in itself the properties of both pike and gun, and could be used indiscriminately as a missile or a weapon at close quarters. But, from this date, missiles have become as decidedly the arbiters of war and the winners of battles, as was the stabbing sword of the Roman legionary, or the lance of the feudal chivalry. Nine-tenths of all the battles that have been fought since the days of the English civil war, have been decided by artillery and musketry, without the crossing of a bayonet, or the stroke of a sword; unless in a casual charge of cavalry, or in the pursuit, after the tide of battle has ebbed into a tumultuous rout. And such will now be the case, more than ever. The French wars of the revolution against the Tyrolese, and the American war of independence, brought the rifle, which was by no means a new weapon as some persons have supposed—for the principle of rifling or screwing barrels, as it was then called, and its effect on the bullet, were known and used even in matchlocks, so early as the 16th century—into general notice, and the invention of percussion doubled even its utility. Recent improvements have overcome the objections to its use as a military weapon, which lay in the difficulty and slowness of loading; while such a wonderful increase of range has been obtained that musketry with the Minié bullet is now fully effective at little short of a mile's distance; and that, not only in volley firing, as against masses of men, but against single individuals, who can be picked off unerringly at 600 and 700 yards' distance. Equal facilities have been gained in the acquisition of the art and skill of taking aim; and the system of instruction has so far advanced, that it is now believed that any man of ordinary mental and physical powers may be taught to become an efficient marksman, and that it is evident, that unless the range and practice of great guns can be equally improved and increased, small arms will decide the issue of every battle, since it has been proved not only possible but easy to silence cannon, by shooting down the artillerists at their guns, beyond the range of grape. Such is a brief review of the arms which have proved the most effective from the earliest periods of history to the present day. What further strides modern science and invention may make in this department, it is not easy to foresee, or possible to predict; but it is satisfactory to know that with every increase of the facility of killing, and improvement of

the means of destruction, war becomes less probable, and, when actually present, less bloody than in the old days of simple sword and buckler.

ARMSTRONG, a county in central Pennsylvania, having an area of 750 square miles; population, 29,560; capital, Kittanning. The surface of the country is undulating, and the soil generally fertile. It is watered by the Alleghany, and several smaller streams. Its most valuable mineral productions are iron, salt, and coal. In 1850 this county produced 197,697 bushels of wheat, 195,501 of Indian corn, 470,742 of oats, 16,047 tons of hay, and 489,108 pounds of butter. There were 21 flour and grist mills, 12 salt-boiling establishments, 5 carpentering and building establishments, 13 saw mills, 9 manufactories of brick, and 8 of tin and sheet-iron ware, 2 woollen factories, 1 nail factory, 2 iron foundries, 2 forges, 1 furnace, and 8 tanneries. It contained in that year 65 churches, and 2 newspaper establishments. There were 6,477 pupils attending public schools, and 135 attending academies or other schools. The Pennsylvania canal passes through its southern extremity. The county, which is named after Gen. Armstrong, was organized in 1800.

ARMSTRONG, JOHN, general, an American officer in the revolutionary war, the author of the celebrated anonymous "Newburg Addresses," afterward minister to France, and secretary of war in 1813, born at Carlisle, Penn., in 1758, died April 1, 1848. At the age of 18 he entered the army as a volunteer, was one of Gen. Mercer's aids at the battle of Princeton, and bore him in his arms from the field, when he had received his death wound. He afterward became a favorite of Gen. Gates, and served under him, with the rank of major, through the remainder of the war. During the winter of 1782-'83, while the army was encamped at Newburg, great anxiety was felt among the officers and men as to the probable action of congress with regard to the arrearages of pay, and the half-pay promised to those officers who should serve through the war. A committee of 3 was finally appointed to present a memorial to congress, which was received and debated, but no further action was taken. This increased the previous state of dissatisfaction, and on the 10th of March, 1783, a meeting of officers was called anonymously for the next day, to discuss their grievances. On the day appointed an anonymous address was issued, forcibly and eloquently written, in which the writer exhorted his comrades to adopt a bolder tone; to refuse to perform further military duty during the war, or to lay down their arms on the return of peace, unless their first demands were complied with. It required all the prudence, firmness, and judgment of Washington to avert the evil effects of this appeal to the troops. He immediately issued a call for a similar meeting on the 15th inst., for the discussion of their claims, which was followed by

another anonymous address, construing the action of Washington into an approval of the course previously proposed by the writer. At this meeting Washington addressed the officers with great earnestness and feeling, assuring them of his sympathy with their suffering, and his ardent desire to cooperate with them in obtaining the ends which they had in view, but begging them not to follow the dangerous advice of the writer of the addresses, nor sully the glorious reputation which they had acquired, by thus opening the flood-gates of civil discord. His eloquence was completely successful, and a resolution was passed unanimously by the officers, assuring him of their regard, and pledging themselves to reject the advice of the address. Washington wrote an urgent appeal in their behalf to congress, which was successful. Provision was made for the satisfaction of their claims, and the danger passed away. Armstrong wrote these anonymous productions at the request of many of his fellow-officers, and although Washington had spoken in terms of unmeasured reprobation of their author at the time, he afterward saw reason to change his opinion, and in a letter to General Armstrong in 1797 he assured him that he believed his object to have been just, honorable, and friendly to the country. The first civil office which Gen. Armstrong held was that of secretary of the state of Pennsylvania; he was also a member of the old congress. In Nov. 1800 he was chosen a member of the U. S. senate from the state of New York, and in 1804 was sent as minister to France, where he performed the duties of his station in a highly creditable manner, at the same time acting as Spanish minister. He returned home in 1810. At the commencement of the war of 1812 he received a brigadier-general's commission, and the command of the district which included the city of New York. In the following year he unwillingly accepted the office of secretary of war, having a low opinion of the qualifications of the generals in command. He removed the war department to Sackett's Harbor, that he might better watch the operations against Canada, but all his plans were thwarted by the generals commanding the U. S. forces. After the capture of Washington in 1814, Gen. Armstrong retired from political life. He incurred much blame for this disaster, but very unjustly, as Gen. Winder, to whom the defence of the district had been intrusted, was appointed by the president, in direct opposition to his advice. Gen. Armstrong's indignation at Mr. Madison for taking no steps to relieve him of this undeserved disgrace, ended in his resignation. A great portion of the remainder of his life was passed in literary avocations. He wrote 2 excellent treatises on farming and gardening, a severe criticism of Gen. Wilkinson's memoirs, several biographical sketches, and a history of the war of 1812. He also projected and partly prepared a history of the American revolution, for which task his intimacy with the chief actors in the struggle, and the share which

he himself had borne in it, gave him extraordinary facilities. He married a sister of the late Chancellor Livingston in 1789, and took up his residence on the North river, at Redhook, in Dutchess county.

ARMSTRONG, JOHN, a physician, poet, and miscellaneous writer, best known as the author of the "Art of Preserving Health," a didactic poem which was prodigiously admired in its day, born in Castleton parish, Roxburghshire, about 1709, died in 1779. His father was a clergyman. He studied at the university of Edinburgh, and after receiving his medical diploma, he settled in London. His practice, however, was very small. In 1785 he published anonymously, "An Essay for Abridging the Study of Physic," in which he ridiculed the ignorance of the apothecaries. In 1787 he published an outrageously indecent poem entitled the "Economy of Love." In 1744 appeared the "Art of Preserving Health," a work which, though containing some fine passages, has but little merit considered as a whole. He remained in London until 1760, when, through the influence of John Wilkes, as it is said, he was made physician to the army in Germany, and held that office until the peace of 1763. He subsequently quarreled with Wilkes. He seems to have been soured latterly by his disappointments, and his writings abound in attacks upon the medical profession. He possessed, however, the friendship of Thomson, and retained it to the last. During the closing years of his life, he lived upon his half-pay, from which he was found at his decease to have saved £3,000. His remaining published writings are a volume of "Sketches or Essays," a collection of short poems under the title of "Miscellanies," a "Short Ramble through France and Italy," and a volume of medical essays.

ARMSTRONG, JOHN, an eminent physician and author of several medical works, born May 8, 1784, at Bishop Wearmouth, in Durham, died of consumption, Dec. 12, 1829, in London. His early advantages were small, but at the age of 19 he entered on his medical studies at Edinburgh, where he took his degree in 1807, and commenced practising in his native place. He soon removed to the neighboring town of Sunderland, and in 4 years became the leading physician of the place. In 1816 he published his work on "Typhus," which had a rapid sale throughout the kingdom. In 1818 he removed to London, where he met with great success, which was the more surprising, as he failed to pass his examination before the college of physicians, a necessary preliminary to commencing practice in the city. That institution was exceedingly unpopular in the profession, however, and his rejection was ascribed to jealousy. In consequence of the prevalence of this opinion, he was soon after elected physician to the fever hospital. In 1821 he united with Mr. Grainger in founding the Webb-street school of medicine, where his lectures were exceedingly popular. His chief defect was immoderate ego-

tism, he regarding himself as a great reformer in the healing art. He ridiculed Cullen and other eminent writers in unmeasured terms. His lectures, edited by Joseph Rix, were published in 1884. As a practitioner, Dr. Armstrong well deserved the success he achieved. In private life he was most amiable. Beside the works above mentioned, he wrote several other medical treatises.

ARMSTRONG, SAMUEL T., a printer and bookseller, at one time mayor of Boston, died March 26, 1850, aged 66. He published Dr. Buchanan's researches in Asia, which had an enormous sale, and a stereotype edition of Scott's Bible, which was very successful. He accumulated a large fortune in trade. Mr. Armstrong held also the office of lieutenant-governor, and acted as governor in 1836, when Gov. Davis was sent to the U. S. senate.

ARMSTRONG, WILLIAM JOSEPH, D. D., an American clergyman, and secretary of the American board of commissioners for foreign missions, born at Mendham, New Jersey, Oct. 30, 1796, died by shipwreck, Nov. 27, 1846. He was a graduate of Princeton college and theological seminary, and began to preach as a missionary in central Virginia. He was in 1824 installed pastor of the first Presbyterian church in Richmond, where he labored with fidelity and success for 10 years. In 1834, being appointed to the secretaryship of the American board of missions, he removed to Boston, and in 1838, at the suggestion of the prudential committee of the board, he changed his residence to New York. He, however, visited Boston each month to attend the meeting of the prudential committee. In returning from one of these journeys, the boat in which he had taken passage was lost in a tempest, and many of the passengers, among whom was Dr. Armstrong, perished. His life and a collection of his sermons have been published.

ARMY, the organized body of armed men which a state maintains for purposes of offensive or defensive war. Of the armies of ancient history the first of which we know any thing positive is that of Egypt. Its grand epoch of glory coincides with the reign of Rhamses II. (Sesostris), and the paintings and inscriptions relating to his exploits on the numerous monuments of his reign, form the principal source of our knowledge on Egyptian military matters. The warrior caste of Egypt was divided into two classes, *hermotybi* and *calasiri*, the first 160,000, the other 250,000 strong, in their best times. It appears that these two classes were distinguished from each other merely by age or length of service, so that the *calasiri*, after a certain number of years, passed into the *hermotybi* or reserve. The whole army was settled in a sort of military colonies, an ample extent of land being set apart for each man as an equivalent for his services. These colonies were mostly situated in the lower part of the country, where attacks from the neighboring Asiatic states were to be anticipated; a few colonies only were establish-

ed on the upper Nile, the Ethiopians not being very formidable opponents. The strength of the army lay in its infantry, and particularly in its archers. Beside these latter there were bodies of foot soldiers, variously armed and distributed into battalions, according to their arms; spearmen, swordsmen, clubmen, slingers, &c. The infantry was supported by numerous war-chariots, each manned by 2 men, one to drive and the other to use the bow. Cavalry does not figure on the monuments. One solitary drawing of a man on horseback is considered to belong to the Roman epoch, and it appears certain that the use of the horse for riding and of cavalry became known to the Egyptians through their Asiatic neighbors only. That at a later period they had a numerous cavalry, acting, like all cavalry in ancient times, on the wings of the infantry, is certain from the unanimity of the ancient historians on this point. The defensive armor of the Egyptians consisted of shields, helmets, and breastplates, or coats-of-mail, of various materials. Their mode of attacking a fortified position shows many of the means and artifices known to the Greeks and Romans. They had the *testudo*, or battering-ram, the *vineæ*, and scaling-ladder; that they, however, also knew the use of movable towers, and that they undermined walls, as Sir G. Wilkinson maintains, is a mere supposition. From the time of Psammeticus a corps of Grecian mercenaries was maintained; they were also colonized in lower Egypt.—Assyria furnishes us with the earliest specimen of those Asiatic armies which, for above 1,000 years, struggled for the possession of the countries between the Mediterranean and the Indus. There, as in Egypt, the monuments are our principal source of information. The infantry appear armed similar to the Egyptian, though the bow seems less prominent, and the arms offensive and defensive are generally of better make and more tasteful appearance. There is, beside, more variety of armament, on account of the greater extent of the empire. Spear, bow, sword, and dagger, are the principal weapons. Assyrians in the army of Xerxes are also represented with iron-mounted clubs. The defensive armament consisted of a helmet (often very tastefully worked), a coat of mail of felt or leather, and a shield. The war-chariots still formed an important portion of the army; it had 2 occupants, and the driver had to shelter the bowman with his shield. Many of those who fight in chariots are represented in long coats-of-mail. Then there was the cavalry, which here we meet with for the first time. In the earliest sculptures the rider mounts the bare back of his horse; later on, a sort of pad is introduced, and in one sculpture a high saddle is depicted, similar to that now in use in the East. The cavalry can scarcely have been very different from that of the Persians and later eastern nations—light, irregular horse, attacking in disorderly swarms, easily repelled by a well-armed, solid infantry, but formidable to a disordered or beaten army.

Accordingly, it figured in rank behind the charioteers, who appear to have formed the aristocratic arm of the service. In infantry tactics some progress toward regular movements and formations in ranks and files appears to have been made. The bowmen either fought in advance, where they were always covered, each of them, by a shield-bearer, or they formed the rear rank, the first and second ranks, armed with spears, stooping or kneeling to enable them to shoot. In sieges they certainly knew the use of movable towers and mining; and, from a passage in Ezekiel, it would almost appear that they made some sort of mound or artificial hill to command the walls of the town—a rude beginning of the Roman *agger*. Their movable and fixed towers, too, were elevated to the height of the besieged wall, and higher, so as to command it. The ram and vinea they used also; and, numerous as their armies were, they turned off whole arms of rivers into new beds in order to gain access to a weak front of the attacked place, or to use the dry bed of the river as a road into the fortress. The Babylonians seem to have had armies similar to those of the Assyrians, but special details are wanting.—The Persian empire owed its greatness to its founders, the warlike nomads of the present Farsistan, a nation of horsemen, with whom cavalry took at once that predominant rank which it has since held in all eastern armies, up to the recent introduction of modern European drill. Darius Hystaspes established a standing army, in order to keep the conquered provinces in subjection, as well as to prevent the frequent revolts of the satraps, or civil governors. Every province thus had its garrison, under a separate commander; fortified towns, beside, were occupied by detachments. The provinces had to bear the expense of maintaining these troops. To this standing army also belonged the guards of the king, 10,000 chosen infantry (the *Immortals*, *Athanatoi*), resplendent with gold, followed on the march by long trains of carriages, with their harems and servants, and of camels with provisions, beside 1,900 halberdiers, 1,000 horse guards, and numerous war-chariots, some of them armed with scythes. For expeditions of magnitude this armament was considered insufficient, and a general levy from all the provinces of the empire took place. The mass of these various contingents formed a truly oriental army, composed of the most heterogeneous parts, varying among themselves in armament and mode of fighting, and accompanied by immense trains of baggage and innumerable camp-followers. It is to the presence of these latter that we must ascribe the enormous numbers of the Persian armies as estimated by the Greeks. The soldiers, according to their respective nationality, were armed with bows, javelins, spears, swords, clubs, daggers, slings, &c. The contingent of every province had its separate commander; they appear, from Herodotus, to have been divided by tens, hundreds, thousands, &c., with officers to command each

decimal subdivision. The commands of large corps or of the wings of the army were generally given to members of the royal family. Among the infantry the Persian and the other Aryan nations (Medes and Bactrians) formed the *élite*. They were armed with bows, spears of moderate size, and a short sword; the head was protected by a sort of turban, the body by a coat covered with iron scales; the shield was mostly of wicker-work. Yet this *élite*, as well as the rest of the Persian infantry, was miserably beaten whenever it was opposed to even the smallest bodies of Greeks, and its unwieldy and disorderly crowds appear quite incapable of any but passive resistance against the incipient phalanx of Sparta and Athens; witness Marathon, Plataea, Mycale, and Thermopylae. The war-chariots, which in the Persian army appear for the last time in history, might be useful on quite level ground against such a motley crowd as the Persian infantry themselves were, but against a solid mass of pikemen, such as the Greeks formed, or against light troops taking advantage of inequalities of ground, they were worse than useless. The least obstacle stopped them. In battle the horses got frightened, and, no longer under command, ran down their own infantry. As to the cavalry, the earlier periods of the empire give us little proof of its excellence. There were 10,000 horse on the plain of Marathon—a good cavalry country—yet they could not break the Athenian ranks. In later times it distinguished itself at the Granicus, where, formed in one line, it fell on the heads of the Macedonian columns as they emerged from the folds of the river, and upset them before they could deploy. It thus successfully opposed Alexander's advanced guard, under Ptolemy, for a long while until the main body arrived and the light troop manoeuvred on its flanks, when, having no second line or reserve, it had to retire. But at this period the Persian army had been strengthened by the infusion of a Greek element, imported by the Greek mercenaries, who, soon after Xerxes, were taken into pay by the king; and the cavalry tactics displayed by Memnon on the Granicus are so thoroughly un-Asiatic that we may, in the absence of positive information, once ascribe them to Greek influence.—The armies of Greece are the first of the detailed organization of which we have ample and certain information. With them the history of tactics, especially infantry tactics, may be said to begin. Without stopping to give an account of the warlike system of the heroic age of Greece, as described in Homer, when cavalry was unknown when the nobility and chiefs fought in war-chariots, or descended from them for a duel with an equally prominent enemy, and when the infantry appears to have been little better than that of the Asiatics, we at once pass to the military force of Athens in the time of its greatness. In Athens every free-born man was liable to military service. The holders of certain public offices alone, and, in the earlier times, the fourth or poorest class of freemen

were exempt. It was a militia system based upon slavery. Every youth on attaining his 18th year was obliged to do duty for 2 years, especially in watching the frontiers. During this time his military education was completed; afterward he remained liable to service up to his 60th year. In case of war the assembled citizens fixed the number of men to be called out; in extreme cases only the *leues en masses* (*panstratia*) were resorted to. The *strategi*, 10 of whom were annually elected by the people, had to levy these troops and to organize them, so that the men of each tribe, or *phyla*, formed a body under a separate *phylarch*. These officers, as well as the *tactarchs*, or captains of companies, were equally elected by the people. The whole of this levy formed the heavy infantry (*hoplites*) destined for the phalanx or deep line formation of spearmen, which originally formed the whole of the armed force, and subsequently, after the addition of light troops and cavalry, remained its mainstay—the corps which decided the battle. The phalanx was formed in various degrees of depth; we find mentioned phalanxes of 8, 12, 25 deep. The armature of the hoplites consisted of a breastplate or corslet, helmet, oval target, spear, and short sword. The *forts* of the Athenian phalanx was attack; its charge was renowned for its furious impetus, especially after Miltiades, at Marathon, had introduced the quickening of the pace during the charge, so that they came down on the enemy with a run. On the defensive, the more solid and closer phalanx of Sparta was its superior. While at Marathon the whole force of the Athenians consisted of a heavy armed phalanx of 10,000 hoplites, at Plataea they had, beside 8,000 hoplites, an equal number of light infantry. The tremendous pressure of the Persian invasions necessitated an extension of the liability to service; the poorest class, that of the *thetes*, was enrolled. They were formed into light troops (*gymneta, pnik*); they had no defensive armor at all, or a target only, and were supplied with a spear and javelin. With the extension of the Athenian power, their light troops were reinforced by the contingents of their allies, and even by mercenary troops. Acarnanians, Ætolians, and Cretans, celebrated as archers and slingers, were added. An intermediate class of troops, between them and the hoplites, was formed, the *peltasta*, armed similar to the light infantry, but capable of occupying and maintaining a position. They were, however, of but little importance until after the Peloponnesian war, when Iphicrates reorganized them. The light troops of the Athenians enjoyed a high reputation for intelligence and quickness both in resolution and in execution. On several occasions, probably in difficult ground, they even successfully opposed the Spartan phalanx. The Athenian cavalry was introduced at a time when the republic was already rich and powerful. The mountainous ground of Attica was unfavorable to this arm, but the neighborhood of Thessaly and Boeotia,

countries rich in horses, and consequently the first to form cavalry, soon caused its introduction in the other states of Greece. The Athenian cavalry, first 800, then 600, and even 1,000 strong, was composed of the richest citizens, and formed a standing corps even in time of peace. They were a very effective body, extremely watchful, intelligent, and enterprising. Their position in battle, as well as that of the light troops, was generally on the wings of the phalanx. In later times, the Athenians also maintained a corps of 200 mercenary mounted archers (*hippotoxata*). The Athenian soldier, up to the time of Pericles, received no pay. Afterward 2 oboli (beside 2 more for provisions, which the soldier had to find) were given, and sometimes even the hoplites received as much as 2 drachms. Officers received double pay, cavalry soldiers three-fold, generals four-fold. The corps of heavy cavalry alone cost 40 talents (\$40,000) per annum in time of peace, during war considerably more. The order of battle and mode of fighting were extremely simple; the phalanx formed the centre, the men locking their spears, and covering the whole front with their row of shields. They attacked the hostile phalanx in a parallel front. When the first onset was not sufficient to break the enemy's order, the struggle hand to hand with the sword decided the battle. In the mean time the light troops and cavalry either attacked the corresponding troops of the enemy, or attempted to operate on the flank and rear of the phalanx, and to take advantage of any disorder manifesting itself in it. In case of a victory they undertook the pursuit, in case of defeat they covered the retreat as much as possible. They were also used for reconnoitring expeditions and forays, they harassed the enemy on the march, especially when he had to pass a defile, and they tried to capture his convoys and stragglers. Thus the order of battle was extremely simple; the phalanx always operated as a whole; its subdivisions into smaller bodies had no technical significance; their commanders had no other task than to see that the order of the phalanx was not broken, or at least quickly restored. What the strength of Athenian armies was during the Persian wars, we have shown above by a few examples. At the beginning of the Peloponnesian war, the force mustered 18,000 hoplites for field service, 61,000 (the youngest and the oldest soldiers) for garrison duty, 1,200 horsemen, and 1,600 archers. According to Boeckh's calculations the force sent against Syracuse numbered 88,560 men; reinforcements despatched afterward, 26,000 men; in all nearly 65,000 men. After the complete ruin of this expedition, indeed, Athens was as much exhausted as France after the Russian campaign of 1812.—Sparta was the military state, *par excellence*, of Greece. If the general gymnastic education of the Athenians developed the agility as much as the strength of the body, the Spartans directed their attention mostly to strength, endurance, and hardness. They

valued steadiness in the ranks, and military point of honor, more than intelligence. The Athenian was educated as if he was to fight among light troops, yet in war he was fitted into his fixed place in the heavy phalanx; the Spartan, on the contrary, was brought up for service in the phalanx, and nothing else. It is evident that as long as the phalanx decided the battle, the Spartan, in the long run, had the best of it. In Sparta, every freeman was enrolled in the army lists from his 20th to his 60th year. The *ephoroi* determined the number to be called out, which was generally chosen among the middle-aged men, from 30 to 40. As in Athens, the men belonging to the same tribe or locality were enrolled in the same body of troops. The organization of the army was based upon the confraternities (*enomotiai*) introduced by Lycurgus, 2 of which formed a pentecostys; 2 of these were united into a lochos, and 8 or 4 lochi into a mora. This was the organization in Xenophon's time; in former periods it appears to have varied. The strength of a mora is variously stated at from 400 to 900 men, and their number at one time was said to be 600. These various bodies of free Spartans formed the phalanx; the hoplitæ forming it were armed with a spear, a short sword, and a shield fastened round the neck. Later on, Cleomenes introduced the large Carian shield, fastened by a string on the left arm, and leaving both hands of the soldier free. The Spartans considered it disgraceful for their men to return, after a defeat, without their shields; the preservation of the shield proved the retreat to have been made in good order and a compact phalanx, while single fugitives, running for their lives, of course had to throw away the clumsy shield. The Spartan phalanx was generally 8 deep, but sometimes the depth was doubled by placing one wing behind the other. The men appear to have marched in step; some elementary evolutions were also in use, such as changing front to the rear by the half-turn of each man, advancing or retiring a wing by wheeling, &c., but they would seem to have been introduced at a later period only. In their best times, the Spartan phalanx, like that of Athens, knew the parallel front attack only. The ranks, on the march, were distant from each other 6 feet, in the charge 3 feet, and in a position receiving the charge, only 1½ foot, from rank to rank. The army was commanded by one of the kings, who, with his suite (*damotia*), occupied a position in the centre of the phalanx. Afterward, the number of the free Spartans having considerably decreased, the strength of the phalanx was kept up by a selection from the subjected *Periæci*. The cavalry was never stronger than about 600 men, divided into troops (*ulami*) of 50 men. It merely covered the wings. There was, beside, a body of 300 mounted men, the *élite* of the Spartan youth, but they dismounted in battle, and formed a sort of body-guard of hoplitæ around the king. Of light troops,

there were the *skiritæ*, inhabitants of the mountains near Arcadia, who generally covered the left wing; the hoplitæ of the phalanx, beside, had Helot servants, who were expected in battle to do duty as skirmishers; thus, the 5,000 hoplitæ at Platæa brought 35,000 Helot light troops with them, but of the exploits of these latter we find nothing stated in history.—The simple tactics of the Greeks underwent considerable changes after the Peloponnesian war. At the battle of Leuctra, Epaminondas had to oppose, with a small force of Thebans, the far more numerous, and hitherto invincible Spartan phalanx. The plain, parallel front attack, here, would have been equivalent to certain defeat, both wings being outflanked by the longer front of the enemy. Epaminondas, instead of advancing in line, formed his army into a deep column, and advanced against one wing of the Spartan phalanx, where the king had taken his station. He succeeded in breaking through the Spartan line at this, the decisive point; he then wheeled his troops round, and moving on either hand, he himself outflanked the broken line, which could not form a new front without losing its tactical order. At the battle of Mantinea, the Spartans formed their phalanx with a greater depth, but, nevertheless, the Theban column again broke through it. Agesilans in Sparta, Timotheus, Iphicrates, Chabrias in Athens, also introduced changes in infantry tactics. Iphicrates improved the *pellasta*, a sort of light infantry, capable, however, in case of need, to fight in line. They were armed with a small round target, strong linen corslet, and long spear of wood. Chabrias made the first ranks of the phalanx, when on the defensive, kneel down to receive the enemy's charge. Full squares, and other columns, &c., were introduced, and accordingly deployments formed part of the elementary tactics. At the same time, greater attention was paid to light infantry of all kinds; several species of arms were borrowed from the barbarous and semi-barbarous neighbors of the Greeks, such as archers, mounted and on foot, slingers, &c. The majority of the soldiers of this period consisted of mercenaries. The wealthy citizens, instead of doing duty themselves, found it more convenient to pay for a substitute. The character of the phalanx, as the preëminently national portion of the army, in which the free citizens of the state only were admitted, thus suffered from this admixture of mercenaries, who had no right of citizenship. Toward the approach of the Macedonian epoch, Greece and her colonies were as much a mart for soldiers of fortune, and mercenaries, as Switzerland in the 18th and 19th centuries. The Egyptian kings had at an early time formed a corps of Greek troops. Afterward, the Persian king gave his army some steadiness by the admission of a body of Greek mercenaries. The chiefs of these bodies were regular condottieri, as much as those of Italy in the 16th century. During this period, warlike engines for throwing stones, darts, and

incendiary projectiles, were introduced, especially by the Athenians. Pericles already used some similar machines at the siege of Samos. Sieges were carried on by forming a line of contravallation, with ditch, or parapet, round the place, investing it, and by the attempt to place the war-engines in a commanding position near the walls. Mining was regularly made use of, to bring the walls down. At the assault, the column formed the *synspermus*, the outer ranks holding their shields before them, and the inner ranks holding them over their heads, so as to form a roof (called by the Romans, *testudo*), against the projectiles of the enemy.—While Greek skill was thus mainly directed toward shaping the flexible material of the mercenary bands into all sorts of novel and artificial formations, and in adopting or inventing new species of light troops, to the detriment of the ancient Doric heavy phalanx, which at that time alone could decide battles, a monarchy grew up, which, adopting all real improvements, formed a body of heavy infantry of such colossal dimensions, that no army with which it came in contact could resist its shock. Philip of Macedon formed a standing army of about 80,000 infantry, and 8,000 cavalry. The main body of the army was an immense phalanx of some 16,000 or 18,000 men, formed upon the principle of the Spartan phalanx, but improved in armament. The small Grecian shield was replaced by the large oblong Carian buckler, and the moderately sized spear by the Macedonian pike (*sarissa*) of 24 feet in length. The depth of this phalanx varied, under Philip, from 8, to 10, 12, 24 men. With the tremendous length of the pikes, each of the 6 front ranks could, on levelling them, make the points project in front of the first rank. The regular advance of such a long front of from 1,000 to 2,000 men, presupposes a great perfection of elementary drill, which in consequence was continually practised. Alexander completed this organization. His phalanx was, normally, 16,384 men strong, or 1,024 in front by 16 deep. The file of 16 (*lochos*) was conducted by a lochagos, who stood in the front rank. Two files formed a dilochy, 2 of which made a tetrarchy, 2 of which a taxiarchy, 2 of which a xenagy or syntagma, 16 men in front by 16 deep. This was the evolutionary unity, the march being made in columns of xenagies, 16 in front. Sixteen xenagies (equal to 8 pentecosiarchies, or 4 chiliarchies, or 2 telarchies) formed a small phalanx, 2 of which a diphalangarchy, and 4 a tetraphalangarchy or phalanx properly so called. Every one of these subdivisions had its corresponding officer. The diphalangarchy of the right wing was called head, that of the left wing, tail, or rear. Whenever extraordinary solidity was required, the left wing took station behind the right, forming 512 men in front by 32 in depth. On the other hand, by deploying the 8 rear ranks on the left of the front ranks, the extent of front could be doubled, and the depth reduced to 8.

The distances of ranks and files were similar to those of the Spartans, but the close order was so compact that the single soldier in the middle of the phalanx could not turn. Intervals between the subdivisions of the phalanx were not allowed in battle; the whole formed one continuous line, charging *en muraille*. The phalanx was formed by Macedonian volunteers exclusively; though, after the conquest of Greece, Greeks also could enter it. The soldiers were all heavy armed hoplitæ. Beside shield and pike, they carried a helmet and sword, although the hand-to-hand fight with the latter weapon cannot very often have been required after the charge of that forest of pikes. When the phalanx had to meet the Roman legion, the case indeed was different. The whole phalangite system, from the earliest Doric times down to the breaking up of the Macedonian empire, suffered from one great inconvenience; it wanted flexibility. Unless on a level and open plain, these long, deep lines, could not move with order and regularity. Every obstacle in front forced it to form column, in which shape it was not prepared to act. Moreover, it had no second line or reserve. As soon, therefore, as it was met by an army, formed in smaller bodies and adapted to turn obstacles of ground without breaking line, and disposed in several lines seconding each other, the phalanx could not help going into broken ground, where its new opponent completely cut it up. But to such opponents as Alexander had at Arbela, his 2 large phalanxes must have appeared invincible. Beside this heavy infantry of the line, Alexander had a guard of 6,000 hyraspistes, still more heavily armed, with even larger bucklers and longer pikes. His light infantry consisted of argyraspides, with small silver-plated shields, and of numerous peltastæ, both of which troops were organized in demi-phalanxes of normally 8,192 men, being able to fight either in extended order or in line, like the hoplitæ; and their phalanx often had the same success. The Macedonian cavalry was composed of young Macedonian and Thessalian noblemen, with the addition, subsequently, of a body of horsemen from Greece proper. They were divided into squadrons (*ilæ*), of which the Macedonian nobility alone formed 8. They belonged to what we should call heavy cavalry; they wore a helmet, cuirass with cuissarts of iron scales to protect the leg, and were armed with a long sword and pike. The horse, too, wore a frontlet of iron. This class of cavalry, the cataphracti, received great attention both from Philip and Alexander; the latter used it for his decisive manœuvre at Arbela, when he first beat and pursued one wing of the Persians, and then, passing behind their centre, fell upon the rear of the other wing. They charged in various formations: in line, in common rectangular column, in rhomboid or wedge-shaped column. The light cavalry had no defensive armor; it carried javelins and light short lances; there was also a corps of acrobatisæ,

or mounted archers. These troops served for outpost duty, patrols, reconnoitring, and irregular warfare generally. They were the contingents of Thracian and Illyrian tribes, which, beside, furnished some few thousands of irregular infantry. A new arm, invented by Alexander, claims our attention from the circumstance that it has been imitated in modern times, the *dimachæ*, mounted troops, expected to fight either as cavalry or as infantry. The dragoons of the 16th and following centuries are a complete counterpart to these, as we shall see hereafter. We have, however, no information as to whether these hybrid troops of antiquity were more successful in their double task than the modern dragoons. Thus was composed the army with which Alexander conquered the country between the Mediterranean, the Oxus, and the Sutledj. As to its strength, at Arbela, it consisted of 2 large phalanxes of hoplites (say 80,000 men), 2 semi-phalanxes of peltastæ (16,000), 4,000 cavalry, and 6,000 irregular troops, in all about 56,000 men. At the Granicus, his force of all arms was 85,000 men, of whom 5,000 were cavalry.—Of the Carthaginian army we know no details; even the strength of the force with which Hannibal passed the Alps, is disputed. The armies of the successors of Alexander show no improvements on his formations; the introduction of elephants was but of short duration; when terrified by fire, these animals were more formidable to their own troops than to the enemy. The later Greek armies (under the Achaean league) were formed partly on the Macedonian, partly on the Roman system.—The Roman army presents us with the most perfect system of infantry tactics invented during the time when the use of gunpowder was unknown. It maintains the predominance of heavy infantry and compact bodies, but adds to it mobility of the separate smaller bodies, the possibility of fighting in broken ground, the disposition of several lines one behind the other, partly as supports and reliefs, partly as a powerful reserve, and finally a system of training the single soldier which was even more to the purpose than that of Sparta. The Romans, accordingly, overthrew every armament opposed to them, the Macedonian phalanx as well as the Numidian horse.—In Rome every citizen, from his 17th to his 45th or 50th year, was liable to serve, unless he belonged to the lowest class, or had served in 20 campaigns on foot, or 10 campaigns as a horseman. Generally the younger men only were selected. The drill of the soldier was very severe, and calculated to develop his bodily powers in every imaginable way. Running, jumping, vaulting, climbing, wrestling, swimming, first naked, then in full armament, were largely practised, beside the regular drill in the use of the arms and the various movements. Long marches in heavy marching order, every soldier carrying from 40 to 60 lbs., were kept up at the rate of 4 miles an hour. The use of the intrenching tools, and the throw-

ing up of intrenched camps in a short time, also formed part of the military education; and not only the recruits, but even the legions of veterans, had to undergo all these exercises in order to keep their bodies fresh and supple, and to remain inured to fatigue and want. Such soldiers were, indeed, fit to conquer the world.—In the best times of the republic there were generally 2 consular armies, each consisting of 2 legions and the contingents of the allies (in infantry of equal strength, cavalry double the strength of the Romans). The levy of the troops was made in a general assembly of the citizens on the capitol or Campus Martius; an equal number of men was taken from every tribe, which was again equally subdivided among the 4 legions, until the number was completed. Very often citizens, freed from service by age or their numerous campaigns, entered again as volunteers. The recruits were then sworn in and dismissed until required. When called in, the youngest and poorest were taken for the *velites*, the next in age and means for the *hastati* and *principes*, the oldest and wealthiest for the *triarii*. Every legion counted 1,200 *velites*, 1,200 *hastati*, 1,200 *principes*, 600 *triarii*, and 800 horsemen (knights), in all 4,500. The *hastati*, *principes*, and *triarii*, were each divided into 10 *manipuli* or companies, and an equal number of *velites* attached to each. The *velites* (*rorarii*, *accensi*, *forentarii*) formed the light infantry of the legion, and stood on its wings along with the cavalry. The *hastati* formed the 1st, the *principes* the 2d line; they were originally armed with spears. The *triarii* formed the reserve, and were armed with the *pilum*, a short but extremely heavy and dangerous spear, which they threw into the front ranks of the enemy immediately before engaging him sword in hand. Every *manipulus* was commanded by a *centurio*, having a 2d centurion for his lieutenant. The centurions ranked through the whole of the legion, from the 2d centurion of the last or 10th *manipulus* of the *hastati* to the 1st centurion of the 1st *manipulus* of the *triarii* (*primus pilus*), who, in the absence of a superior officer, even took the command of the whole legion. Commonly, the *primus pilus* commanded all the *triarii*, the same as the *primus princeps* (1st centurion of 1st *manipulus* of *principes*), all the *principes* and the *primus hastatus*, and all the *hastati* of the legion. The legion was commanded in the earlier times in turns by its 6 military tribunes; each of them held the command for 2 months. After the 1st civil war, legates were placed as standing chiefs at the head of every legion; the tribunes now were mostly officers intrusted with the staff or administrative business. The difference of armament of the 3 lines had disappeared before the time of Marius. The *pilum* had been given to all 3 lines of the legion; it now was the national arm of the Romans. The qualitative distinction between the 3 lines, as far as it was based upon age and length of service, soon disappeared too. In the battle of Mitellus against

Jugurtha, there appeared, according to Sallust, for the last, time *hastati*, *principes*, *triarii*. Marius now formed out of the 80 manipuli of the legion 10 cohorts, and disposed them in 2 lines of 5 cohorts each. At the same time, the normal strength of the cohort was raised to 600 men; the 1st cohort, under the *primus pilus*, carried the legionary eagle. The cavalry remained formed in *turme* of 80 rank and file and 8 *decurions*, the 1st of whom commanded the *turma*. The armature of the Roman infantry consisted of a shield of demi-cylindric shape, 4 feet by 2½, made of wood, covered with leather and strengthened with iron fastenings; in the middle it had a boss (*umbo*) to parry off spear-thrusts. The helmet was of brass, generally with a prolongation behind to protect the neck, and fastened on with leather bands covered with brass scales. The breastplate, about a foot square, was fastened on a leather corselet with scaled straps passing over the shoulder; for the *centurions*, it consisted of a coat of mail covered with brass scales. The right leg, exposed when advanced for the sword-thrust, was protected by a brass plate. Beside the short sword, which was used for thrusting more than for cutting, the soldiers carried the *pilum*, a heavy spear 4½ feet wood, with a projecting iron point of 1½ foot, or nearly 6 feet in all long, but 2½ inches square in the wood, and weighing about 10 or 11 lbs. When thrown at 10 or 15 paces distance, it often penetrated shields and breastplates, and almost every time threw down its man. The *velites*, lightly equipped, carried light short javelins. In the later periods of the republic, when barbaric auxiliaries undertook the light service, this class of troops disappears entirely. The cavalry were provided with defensive armor similar to that of the infantry, a lance and a longer sword. But the Roman national cavalry was not very good, and preferred to fight dismounted. In later periods it was entirely done away with, and Numidian, Spanish, Gallic, and German horsemen, supplanted it. The tactical disposition of the troops admitted of great mobility. The manipuli were formed with intervals equal to their extent of front; the depth varied from 5 or 6 to 10 men. The manipuli of the 2d line were placed behind the intervals of the 1st; the *triarii* still further to the rear, but in one unbroken line. According to circumstances, the manipuli of each line could close up or form line without intervals, or those of the 2d line could march up to fill the intervals of the 1st; or else, where greater depth was required, the manipuli of the *principes* closed up each in rear of the corresponding manipulus of the *hastati*, doubling its depth. When opposed to the elephants of Pyrrhus, the 3 lines all formed with intervals, each manipulus covering the one in its front, so as to leave room for the animals to pass straight through the order of battle. In this formation the clumsiness of the phalanx was in every way successfully overcome. The legion could move

and manœuvre, without breaking its order of battle, in ground where the phalanx durst not venture without the utmost risk. One or two manipuli at most would have to shorten their front to defile past an obstacle; in a few moments, the front was restored. The legion could cover the whole of its front by light troops, as they could retire, on the advance of the line, through the intervals. But the principal advantage was the disposition in a plurality of lines, brought into action successively, according to the requirements of the moment. With the phalanx, one shock had to decide. No fresh troops were in reserve to take up the fight in case of a reverse—in fact that case was never provided for. The legion could engage the enemy with its light troops and cavalry on the whole of his front—could oppose to the advance of his phalanx its first line of *hastati*, which was not so easily beaten, as at least 6 of the 10 manipuli had first to be broken singly—could wear out the strength of the enemy by the advance of the *hastati*, and finally decide the victory by the *triarii*. Thus the troops and the progress of the battle remained in the hand of the general, while the phalanx, once engaged, was irretrievably engaged with all its strength, and had to see the battle out. If the Roman general desired to break off the combat, the legionary organization permitted him to take up a position with his reserves, while the troops engaged before retired through the intervals, and took up a position in their turn. Under all circumstances, there was always a portion of the troops in good order, for even if the *triarii* were repulsed, the 2 first lines had re-formed behind them. When the legions of Flamininus met Philip's phalanx in the plains of Theessaly, their first attack was at once repulsed; but charge following charge, the Macedonians got tired and lost part of their compactness of formation; and wherever a sign of disorder manifested itself, there was a Roman manipulus to attempt an inroad into the clumsy mass. At last, 20 manipuli attacking the flanks and rear of the phalanx, tactical continuity could no longer be maintained; the deep line dissolved into a swarm of fugitives, and the battle was lost. Against cavalry, the legion formed the *orbis*, a sort of square with baggage in the centre. On the march, when an attack was to be apprehended, it formed the *legio quadrata*, a sort of lengthened column with a wide front, baggage in the centre. This was of course possible in the open plain, only where the line of march could go across the country. In Cæsar's time the legions were mostly recruited by voluntary enlistment in Italy. Since the Social war, the right of citizenship, and with it liability for service, was extended to all Italy, and consequently there were far more men available than required. The pay was about equal to the earnings of a laborer; recruits, therefore, were plentiful, even without having recourse to the conscription. In exceptional cases only were legions recruited

in the provinces; thus Cæsar had his fifth legion recruited in Roman Gallia, but afterward it received the Roman naturalization *en masse*. The legions were far from having the nominal strength of 4,500 men; those of Cæsar were seldom much above 2,000. Levies of recruits were formed into new legions (*legiones tironum*), rather than mixed with the veterans in the old legions; these new legions were at first excluded from battles in the open field, and principally used for guarding the camp. The legion was divided into 10 cohorts of 8 manipuli each. The names of hastati, principes, triarii, were maintained as far as necessary to denote the rank of officers according to the system indicated above; as to the soldiers, these names had lost all significance. The 6 centurions of the first cohort of each legion were, by right, present at councils of war. The centurions rose from the ranks, and seldom attained higher command; the school for superior officers was in the personal staff of the general, consisting of young men of education, who soon advanced to the rank of *tribuni militum*, and later on to that of *legati*. The armament of the soldier remained the same: pilum and sword. Beside his accoutrements, the soldier carried his personal baggage, weighing from 35 to 60 pounds. The contrivance for carrying it was so clumsy that the baggage had first to be deposited before the soldier was ready for battle. The camp-utensils of the army were carried on the back of horses and mules, of which a legion required about 500. Every legion had its eagle, and every cohort its colors. For light infantry, Cæsar drew from his legions a certain number of men (*antesignani*), men equally fit for light service and for close fight in line. Beside these, he had his provincial auxiliaries, Cretan archers, Balearic slingers, Gallic and Numidian contingents, and German mercenaries. His cavalry consisted partly of Gallic, partly of German troops. The Roman velites and cavalry had disappeared some time ago.—The staff of the army consisted of the *legati*, appointed by the senate, the lieutenants of the general, whom he employed to command detached corps, or portions of the order of battle. Cæsar, for the first time, gave to every legion a legate as standing commander. If there were not legati enough, the *questor*, too, had to take the command of a legion. He was properly the paymaster of the army, and chief of the commissariat, and was assisted in this office by numerous clerks and orderlies. Attached to the staff were the *tribuni militum*, and the young volunteers above mentioned (*contubernales, comites prætorii*), doing duty as adjutants, orderly officers; but in battle they fought in line, the same as private soldiers, in the ranks of the *cohors prætoria*, consisting of the lictors, clerks, servants, guides (*speculatores*), and orderlies (*apparitores*) of the head-quarters. The general, beside, had a sort of personal guard, consisting of veterans, who voluntarily had reenlisted on the call of their former chief. This troop, mounted on the march, but fighting

on foot, was considered the *élite* of the army; it carried and guarded the *vexillum*, the signal-banner for the whole army. In battle, Cæsar generally fought in 3 lines, 4 cohorts per legion in the first, and 8 in the second and third lines each; the cohorts of the second line dressed on the intervals of the first. The second line had to relieve the first; the third line formed a general reserve for decisive manœuvres against the front or flank of the enemy, or for parrying his decisive thrusts. Wherever the enemy so far outflanked the line that its prolongation became necessary, the army was disposed in two lines only. One single line (*acies simplex*) was made use of in an extreme case of need only, and then without intervals between the cohorts; in the defence of a camp, however, it was the rule, as the line was still 8 to 10 deep, and could form a reserve from the men who had no room on the parapet. Augustus completed the work of making the Roman troops a regular standing army. He had 25 legions distributed all over the empire, of which 8 were on the Rhine (considered the main strength, *præcipuum robur*, of the army), 3 in Spain, 2 in Africa, 2 in Egypt, 4 in Syria and Asia Minor, 6 in the Danubian countries. Italy was garrisoned by chosen troops recruited exclusively in that country, and forming the imperial guard; this consisted of 12, later on, of 14 cohorts; beside these the city of Rome had 7 cohorts of municipal guards (*vigiles*), formed, originally, from emancipated slaves. Beside this regular army, the provinces had to furnish, as formerly, their light auxiliary troops, now mostly reduced to a sort of militia for garrison and police duty. On menaced frontiers, however, not only these auxiliary troops, but foreign mercenaries, too, were employed in active service. The number of legions increased under Trajan to 30, under Septimius Severus to 38. The legions, beside their numbers, had names, taken from their stations (*L. Germanica*, *L. Italica*), from emperors (*L. Augusta*), from gods (*L. Primigenia*, *L. Apollinaria*), or conferred as honorary distinctions (*L. fidelis*, *L. pia*, *L. invicta*). The organization of the legion underwent some changes. The commander was now called *præfectus*. The first cohort was doubled in strength (*cohors milliaria*), and the normal strength of the legion raised to 6,100 infantry and 726 cavalry; this was to be the minimum, and in case of need one or more *cohortes milliariae* were to be added. The *cohors milliaria* was commanded by a military tribune, the others by tribunes or *præpositi*; the rank of *centurio* was thus confined to subalterns. The admission of liberated, or non-liberated slaves, natives of the provinces, and all sorts of people into the legions, became the rule; Roman citizenship being required for the prætorians in Italy only, and even there this was abandoned in later times. The Roman nationality of the army was thus very soon drowned in the influx of barbaric and semi-barbaric, Romanized and non-Romanized elements; the officers alone maintained the Roman character.

This deterioration of the elements composing the army very soon reacted upon its armament and tactics. The heavy breastplate and pilum were thrown overboard; the toilsome system of drill, which had formed the conquerors of the world, was neglected; camp-followers and luxuries became necessary to the army, and the *impedimenta* (train of baggage) increased as strength and endurance decreased. As had been the case in Greece, the decline was marked by neglect of the heavy line-infantry, by a foolish fancy for all sorts of light armament, and by the adoption of barbaric equipments and tactics. Thus we find innumerable classifications of light troops (*auxiliatores, accursatores, jaculatores, accursatores, praecursatores, scutati, funditores, ballistarii, tragularii*), armed with all sorts of projectiles, and we are told by Vegetius that the cavalry had been improved in imitation of the Goths, Alani, and Huns. Finally, all distinction of equipment and armament between Romans and barbarians ceased, and the Germans, physically and morally superior, marched over the bodies of the un-Romanized legions.—The conquest of the Occident by the Germans thus was opposed by but a small remnant, a dim tradition of the ancient Roman tactics; but even this small remnant was now destroyed. The whole of the middle ages is as barren a period for the development of tactics as for that of any other science. The feudal system, though in its very origin a military organization, was essentially opposed to discipline. Rebellions and secessions of large vassals, with their contingents, were of regular occurrence. The distribution of orders to the chiefs turned generally into a tumultuous council of war, which rendered all extensive operations impossible. Wars, therefore, were seldom directed on decisive points; struggles for the possession of a single locality filled up entire campaigns. The only operations of magnitude occurring in all this period (passing over the confused times from the 6th to the 13th century), are the expeditions of the German emperors against Italy, and the crusades, the one as resultless as the other.—The infantry of the middle ages, composed of the feudal retainers and part of the peasantry, was chiefly composed of pikemen, and mostly contemptible. It was great sport for the knights, covered as they were with iron all over, to ride singly into this unprotected rabble, and lay about them with a will. A portion of the infantry was armed, on the continent of Europe, with the crossbow, while in England the longbow became the national weapon of the peasantry. This longbow was a very formidable weapon, and secured the superiority of the English over the French at Crecy, Poitiers, and Agincourt. Easily protected against rain, which rendered the crossbow unserviceable at times, it projected its arrow to distances above 200 yards, or not much less than the effective range of the old smooth-bored musket. The arrow penetrated a one-inch board, and would even

pass through breastplates. Thus it long maintained its place even against the first small fire-arms, especially as six arrows could be shot off while the musket of that epoch could be loaded and fired once; and even as late as the end of the 16th century Queen Elizabeth attempted to reintroduce the national longbow as a weapon of war. It was especially effective against cavalry; the arrows, even if the armor of the men-at-arms was proof against them, wounded or killed the horses, and the unhorsed knights were thereby disabled, and generally made prisoners. The archers acted either in skirmishing order or in line. Cavalry was the decisive arm of the middle ages. The knights in full armor formed the first effective body of heavy cavalry, charging in regular formation, which we meet with in history; for Alexander's cataphracts, though they decided the day at Arbela, were so much an exception that we hear nothing more of them after that day, and during the whole sequel of ancient history, infantry maintains its preëminent rank in battle. The only progress, then, which the middle ages have bequeathed to us, is the creation of a cavalry, from which our modern mounted service descends in a direct line. And yet, what a clumsy thing this cavalry was, is proved by the one fact, that during the whole middle ages the cavalry was the heavy, slow-moving arm, while all light service and quick movements were executed by infantry. The knights, however, did not always fight in close order. They preferred fighting duels with single opponents, or spurring their horses into the midst of the hostile infantry; thus the mode of fighting out a battle was carried back to the Homeric times. When they did act in close order, they charged either in line (one deep, the more lightly-armed esquires forming the second rank) or in deep column. Such a charge was undertaken, as a rule, against the knights (men-at-arms) only of the opposing army; upon its infantry it would have been wasted. The horses, heavily laden with their own as well as their rider's armor, could run but slowly and for short distances. During the crusades, therefore, and in the wars with the Mongolians in Poland and Silesia, this immovable cavalry was constantly tired out, and, finally, worsted by the active light horsemen of the East. In the Austrian and Burgundian wars against Switzerland, the men-at-arms, entangled in difficult ground, had to dismount and form a phalanx even more immovable than that of Macedon; in mountain defiles, rocks and stumps of trees were hurled down upon them, in consequence of which the phalanx lost its tactical order, and was scattered by a resolute attack.—Toward the 14th century a kind of lighter cavalry was introduced, and a portion of the archers were mounted to facilitate their manœuvring; but these and other changes were soon rendered useless, abandoned, or turned to different account by the introduction of that new element, which was destined to change the whole system of warfare—gunpowder.—

From the Arabs in Spain the knowledge of the composition and the use of gunpowder spread to France and the rest of Europe; the Arabs themselves had received it from nations further east, who again had it from the original inventors, the Chinese. In the first half of the 14th century cannon first was introduced into European armies; heavy, unwieldy pieces of ordnance, throwing stone balls, and unfit for any thing but the war of sieges. Small arms were, however, soon invented. The city of Perugia in Italy supplied itself in 1364, with 500 hand-guns, the barrels not more than eight inches long; they subsequently gave rise to the manufacture of pistols (so called from Pistoja in Tuscany). Not long afterward longer and heavier hand-guns (*arquebuses*) were manufactured, corresponding to our present musket; but short and heavy in the barrel, they had but a restricted range, and the matchlock was an almost absolute hinderance to correct aim, beside having nearly every other possible disadvantage. Toward the close of the 14th century there was no military force in western Europe without its artillery and arquebusiers. But the influence of the new arm on general tactics was very little perceptible. Both large and small fire-arms took a very long time in loading, and what with their clumsiness and costliness, they had not even superseded the crossbow by 1450. —In the mean time the general breaking up of the feudal system, and the rise of cities, contributed to change the composition of armies. The larger vassals were either subdued by central authority, as in France, or had become quasi-independent sovereigns, as in Germany and Italy. The power of the lesser nobility was broken by the central authority in conjunction with the cities. The feudal armies no longer existed; new armies were formed from the numerous mercenaries whom the ruin of feudalism had set free to serve those who would pay them. Thus, something approaching standing armies arose; but these mercenaries, men of all nations, difficult to keep in order, and not very regularly paid, committed very great excesses. In France, King Charles VII. therefore formed a permanent force from native elements. In 1445 he levied 15 *compagnies d'ordonnances* of 600 men each; in all, 9,000 cavalry garrisoned in the towns of the kingdom, and paid with regularity. Every company was divided into 100 lances; a lance consisted of one man-at-arms, 8 archers, an esquire, and a page. Thus they formed a mixture of heavy cavalry with mounted archers, the 2 arms, in battle, acting of course separately. In 1448 he added 16,000 francs-archers, under 4 captains-general, each commanding 8 companies of 500 men. The whole of the archers had the crossbow. They were recruited and armed by the parishes, and free from all taxes. This may be considered the first standing army of modern times.—At the close of this first period of modern tactics, as they emerged from mediæval confusion, the state of things may be summed up as follows:

The main body of the infantry, consisting of mercenaries, was armed with pike and sword, breastplate and helmet. It fought in deep, close masses, but, better armed and drilled than the feudal infantry, it showed greater tenacity and order in combat. The standing levies and the mercenaries, soldiers by profession, were of course superior to the casual levies and disconnected bands of feudal retainers. The heavy cavalry now found it sometimes necessary to charge in close array against infantry. The light infantry was still principally composed of archers, but the use of the hand-gun for skirmishers gained ground. The cavalry remained, as yet, the principal arm; heavy cavalry, men-at-arms encased in iron, but no longer composed, in every case, of the nobility, and reduced from its former chivalrous and Homeric mode of fighting to the more prosaic necessity of charging in close order. But the unwieldiness of such cavalry was now generally felt, and many devices were planned to find a lighter kind of horse. Mounted archers, as has been stated, had in part to supply this want; in Italy and the neighboring countries the *stradioti*, light cavalry on the Turkish plan, composed of Bosnians and Albanian mercenaries, a sort of Bashibazouks, found ready employment, and were much feared, especially in pursuits. Poland and Hungary had, beside the heavy cavalry adopted from the West, retained their own national light cavalry. The artillery was in its infancy. The heavy guns of the time were, indeed, taken into the field, but could not leave their position after it was once taken up; the powder was bad, the loading difficult and slow, and the range of the stone-balls short.—The close of the 15th and the beginning of the 16th century are marked by a double progress; the French improved the artillery, and the Spaniards gave a new character to the infantry. Charles VIII. of France so far made his guns movable that, not only could he take them into the field, but make them change their position during battle and follow the other troops in their movements, which, however, were not very quick. He thereby became the founder of field artillery. His guns, mounted on wheeled carriages and plentifully horsed, proved immensely superior to the old-fashioned clumsy artillery of the Italians (drawn by bullocks), and did such execution in the deep columns of the Italian infantry, that Macchiavelli wrote his "Art of War" principally in order to propose formations, by which the effect of such artillery on infantry could be counteracted. In the battle of Marignano, Francis I. of France defeated the Swiss pikemen by the effective fire and the mobility of this artillery, which, from flanking positions, enfiladed the Swiss order of battle. But the reign of the pike, for infantry, was on the decline. The Spaniards improved the common hand-gun (*arquebuse*) and introduced it into the regular heavy infantry. Their musket (*haquebutte*) was a heavy, long-barrelled arm,

bored for 2-ounce bullets, and fired from a rest formed by a forked pole. It sent its bullet through the strongest breastplate, and was therefore decisive against the heavy cavalry, which got into disorder as soon as the men began falling. Ten or 15 musketeers were placed with every company of pikemen, and the effect of their fire, at Pavia, astonished both allies and enemies. Frundsberg relates that, in that battle a single shot from such a musket used to bring down several men and horses. From that time dates the superiority of the Spanish infantry, which lasted for above 100 years.—The war consequent upon the rebellion of the Netherlands was of great influence on the formation of armies. Both Spaniards and Dutch improved all arms considerably. Hitherto, in the armies of mercenaries, every man offering for enlistment had to come fully equipped, armed, and acquainted with the use of his arms. But in this long war, carried on during 40 years on a small extent of country, the available recruits of this class soon became scarce. The Dutch had to put up with such able-bodied volunteers as they could get, and the government now was under the necessity of seeing them drilled. Maurice of Nassau composed the first drill-regulations of modern times, and thereby laid the foundation for the uniform instruction of a whole army. The infantry began again to march in step; it gained much in homogeneity and solidity. It was now formed into smaller bodies; the companies, hitherto 400 to 500, were reduced to 160 and 200 men, 10 companies forming a regiment. The improved musket gained ground upon the pike; one-third of the whole infantry consisted of musketeers, mixed in each company with the pikemen. These latter, being required for hand-to-hand fight only, retained their helmet, breastplate, and steel gauntlets; the musketeers threw away all defensive armor. The formation was generally 2 deep for the pikemen, and from 5 to 8 deep for the musketeers; as soon as the first rank had fired, it retired to load again. Still greater changes took place in cavalry, and here, too, Maurice of Nassau took the lead. In the impossibility of forming a heavy cavalry of men-at-arms, he organized a body of light-horse recruited in Germany, armed them with a helmet, cuirass, brassards for the arms, steel gauntlets, and long boots, and as with the lance they would not have been a match for the heavy-armed Spanish cavalry, he gave them a sword and long pistols. This new class of horsemen, approaching our modern cuirassiers, soon proved superior to the far less numerous and less movable Spanish men-at-arms, whose horses they shot down before the slow mass broke in upon them. Maurice of Nassau had his cuirassiers drilled as well as his infantry; he so far succeeded, that he could venture to execute in battle, changes of front and other evolutions, with large and small bodies of them. Alva, too, soon found the necessity of improving his light horse; hitherto

they had been fit for skirmishing and single combat only, but under his direction they soon learned to charge in a body, the same as the heavy cavalry. The formation of cavalry remained still 5 to 8 deep. About this time Henry IV. of France introduced a new kind of mounted service, the dragoons, originally infantry, mounted on horses for quicker locomotion only; but very few years after their introduction, they were used as cavalry as well, and equipped for this double service. They had neither defensive armor nor high boots, but a cavalry sword, and sometimes a lance; beside, they carried the infantry musket, or a shorter carbine. These troops did not, however, come up to the expectations which had led to their formation; they soon became a portion of the regular cavalry, and ceased to fight as infantry. (The emperor Nicholas of Russia attempted to revive the original dragoons by forming a body of 16,000 men strong, fit for dismounted as well as mounted service; they never found occasion to dismount in battle, always fought as cavalry, and are now broken up and incorporated, as cavalry dragoons, with the remaining Russian cavalry.) In artillery the French maintained the superiority they had gained. The prolonge was invented by them about this time, and case-shot introduced by Henry IV. The Spaniards and Dutch, too, lightened and simplified their artillery, but still it remained a clumsy concern, and light, movable pieces of effective calibre and range were still unknown.—With the 80 years' war opens the period of Gustavus Adolphus, the great military reformer of the 17th century. His infantry regiments were composed of two-thirds musketeers, and one-third pikemen. Some regiments consisted of musketeers alone. The muskets were so much lightened, that the rest for firing them became unnecessary. He also introduced paper cartridges, by which loading was much facilitated. The deep formation was done away with; his pikemen stood 6, his musketeers only 3 deep. These latter were drilled in firing by platoons and ranks. The unwieldy regiments of 2,000 or 3,000 men were reduced to 1,800 or 1,400, in 8 companies, and 2 regiments formed into a brigade. With this formation he defeated the deep masses of his opponents, often disposed, like a column or full square, 80 deep, upon which his artillery played with terrible effect. The cavalry was reorganized upon similar principles. The men-at-arms were completely done away with. The cuirassiers lost the brassards, and some other useless pieces of defensive armor; they were thus made considerably lighter and more movable. His dragoons fought nearly always as cavalry. Both cuirassiers and dragoons were formed only 3 deep, and had strict orders not to lose time with firing, but to charge at once sword in hand. They were divided into squadrons of 125 men. The artillery was improved by the addition of light guns. The leather guns of Gustavus Adolphus are celebrated, but were not long retained.

They were replaced by cast-iron 4-pounders, so light that they could be drawn by 2 horses; they could be fired 6 times while a musketeer fired twice; 2 of these were attached to every regiment of infantry. Thus, the division of light and heavy field artillery was established; the light guns accompanied the infantry while the heavy ones remained in reserve, or took up a position for the whole of the battle. The armies of this time begin to show the increasing preponderance of infantry over cavalry. At Leipsic, in 1681, Gustavus Adolphus had 19,000 infantry and 11,000 cavalry; Tilly had 81,000 infantry and 18,000 cavalry. At Lützen, 1682, Wallenstein had 24,000 infantry and 16,000 cavalry (in 170 squadrons). The number of guns, too, increased with the introduction of light pieces; the Swedes often had from 5 to 12 guns for every 1,000 men; and at the battle of the Lech, Gustavus Adolphus forced the passage of that river under cover of the fire of 72 heavy guns. During the latter half of the 17th and the first half of the 18th century, the pike, and all defensive armor for infantry, was finally done away with by the general introduction of the bayonet. This weapon, invented in France about 1640, had to struggle 80 years against the pike. The Austrians first adopted it for all their infantry, the Prussians next; the French retained the pike till 1708, the Russians till 1721. The flint-lock, invented in France about the same time as the bayonet, was also gradually introduced, before the year 1700, into most armies. It materially abridged the operation of loading, protected, to some degree, the powder in the pan from rain, and thus contributed very much to the abolition of the pike. Yet firing was still so slow that a man was not expected to use more than from 24 to 36 cartridges in a battle; until in the latter half of this period improved regulations, better drill, and further improvement in the construction of small arms (especially the iron ramrod, first introduced in Prussia), enabled the soldier to fire with considerable rapidity. This necessitated a still further reduction of the depth of formation, and infantry was now formed only 4 deep. A species of *élite* infantry was created in the companies of grenadiers, originally intended to throw hand-grenades before coming to close quarters, but soon reduced to fight with the musket only. In some German armies riflemen had been formed as early as the 80 years' war; the rifle itself had been invented at Leipsic in 1498. This arm was now mixed with the musket, the best shots in each company being armed with it; but, out of Germany, the rifle found but little favor. The Austrians had also a sort of light infantry, called *pandours*: Croatian and Servian irregulars from the military frontier against Turkey, useful in roving expeditions and pursuit, but, from the tactics of the day and their absolute want of drill, useless in battle. The French and Dutch created, for similar purposes, irregular infantry called *compagnies franches*. Cavalry, too, was lightened

in all armies. There were no longer any men-at-arms; the cuirassiers maintained the breastplate and helmet only; in France and Sweden, the breastplate was done away with too. The increasing efficiency and rapidity of infantry fire told very much against cavalry. It was soon considered perfectly useless for this latter arm to charge infantry sword in hand; and the opinion of the irresistibility of a firing line became so prevalent that cavalry, too, was taught to rely more on its carbines than on the sword. Thus, during this period, it often occurs that 2 lines of cavalry maintain a firing fight against each other the same as if they were infantry; and it was considered very daring, to ride up to 80 yards from the enemy, fire a volley, and charge at a trot. Charles XII., however, stuck to the rule of his great predecessor. His cavalry never stopped to fire; it always charged, sword in hand, against any thing opposing it, cavalry, infantry, batteries, and intrenchments; and always with success. The French, too, broke through the new system and recommenced relying on the sword only. The depth of cavalry was still further reduced from 4 to 2. In artillery, the lightening of the guns, the use of cartridges and case-shot, became, now, general. Another great change was that of the incorporation of this arm with the army. Hitherto, though the guns belonged to the state, the men serving them were no proper soldiers, but formed a sort of guild, and artillery was considered not an arm but a handicraft. The officers had no rank in the army, and were considered more related to master-tailors and carpenters than to gentlemen with a commission in their pockets. About this time, however, artillery was made a component part of the army, and divided into companies and battalions; the men were converted into permanent soldiers, and the officers ranked with the infantry and cavalry. The centralization and permanence of the armed contingent upon this change, paved the way for the science of artillery, which, under the old system, could not develop itself.—The passage from deep formation to line, from the pike to the musket, from the supremacy of cavalry to that of infantry, had thus been gradually accomplished when Frederic the Great opened his campaigns, and, with them, the classical era of line tactics. He formed his infantry 8 deep, and got it to fire 5 times in 1 minute. In his very first battles at Mollwitz, this infantry deployed in line, and repelled, by its rapid fire, all charges of the Austrian cavalry, which had just totally routed the Prussian horse; after finishing with the cavalry, the Prussian infantry attacked the Austrian infantry, defeated it, and thus won the battle. Formation of squares against cavalry was never attempted in great battles, but only when infantry, on the march, was surprised by hostile cavalry. In a battle, the extreme wings of the infantry stretched round *en potence*, when menaced by cavalry, and this was generally found sufficient. To op-

pose the Austrian pandours, Frederic formed similar irregular troops, infantry and cavalry, but never relied on them in battle, where they seldom were engaged. The slow advance of the firing-line decided his battles. Cavalry, neglected under his predecessor, was now made to undergo a complete revolution. It was formed only 2 deep, and firing, except on pursuit, was strictly prohibited. Horsemanship, considered, hitherto, of minor importance, was now cultivated with the greatest attention. All evolutions had to be practised at full speed, and the men were required to remain well closed up. By the exertions of Seydlitz, the cavalry of Frederic was made superior to any other then existing or ever existing before it; and its bold riding, close order, dashing charge, and quick rallying, have never yet been equalled by any that succeeded it. The artillery was considerably lightened, and, indeed, so much that some of the heavy-calibred guns were not able to stand full charges, and had, therefore, to be abolished afterward. Yet the heavy artillery was still very slow and clumsy in its movements, owing to inferior and heavy carriages and imperfect organization. In battle, it took up its position from the first, and sometimes changed it for a second position, more in advance, but manœuvring, there was none. The light artillery, the regimental guns attached to the infantry, were placed in front of the infantry-line, 50 paces in advance of the intervals of the battalions; they advanced with the infantry, the guns dragged by the men, and opened fire with canister at 300 yards. The number of guns was very large, from 8 to 6 guns per 1,000 men. The infantry, as well as the cavalry, were divided into brigades and divisions, but as there was scarcely any manœuvring after the battle had once begun, and every battalion had to remain in its proper place in the line, these subdivisions had no tactical influence; with the cavalry, a general of brigade might, during a charge, now and then, have to act upon his own responsibility; but with the infantry, such a case could never occur. This line-formation, infantry in 2 lines in the centre, cavalry in 2 or 3 lines on the wings, was a considerable progress upon the deep formation of former days; it developed the full effect of infantry fire, as well as of the charge of cavalry, by allowing as many men as possible to act simultaneously; but its very perfection in this point confined the whole army, as it were, in a strait-waistcoat. Every squadron, battalion, or gun, had its regulated place in the order of battle, which could not be inverted or in any way disturbed without affecting the efficiency of the whole. On the march, therefore, every thing had to be so arranged that when the army formed front again for encampment or battle, every subdivision got exactly into its correct place. Thus, any manœuvres to be executed, had to be executed with the whole army; to detach a single portion of it for a flank attack, to form a particular reserve for the attack,

with superior forces, of a weak point, would have been impracticable and faulty with such slow troops, fit, only, to fight in line, and with an order of battle of such stiffness. Then, the advance in battle of such long lines was executed with considerable slowness, in order to keep up with the alignment. Tents followed the army constantly, and were pitched every night; the camp was slightly intrenched. The troops were fed from magazines, the baking establishments accompanying the army as much as possible. In short, the baggage and other train of the army were enormous, and hampered its movements to a degree unknown nowadays. Yet, with all these drawbacks, the military organization of Frederic the Great was by far the best of its day, and was eagerly adopted by all other European governments. The recruiting of the forces was almost everywhere carried on by voluntary enlistments, assisted by kidnapping; and it was only after very severe losses that Frederic had recourse to forced levies from his provinces.—When the war of the coalition against the French republic began, the French army was disorganized by the loss of its officers, and numbered less than 150,000 men. The numbers of the enemy were far superior; new levies became necessary, and were made to an immense extent, in the shape of national volunteers, of which, in 1793, there must have been at least 500 battalions in existence. These troops were not drilled, nor was there time to drill them according to the complicated system of line-tactics, and to the degree of perfection required by movements in line. Every attempt to meet the enemy in line was followed by a signal defeat, though the French had far superior numbers. A new system of tactics became necessary. The American revolution had shown the advantage to be gained with undisciplined troops, from extended order and skirmishing fire. The French adopted it, and supported the skirmishers by deep columns, in which a little disorder was less objectionable, so long as the mass remained well together. In this formation, they launched their superior numbers against the enemy, and were generally successful. This new formation and the want of experience of their troops led them to fight in broken ground, in villages and woods, where they found shelter from the enemy's fire, and where his line was invariably disordered; their want of tents, field-batteries, &c., compelled them to bivouac without shelter, and to live upon what the country afforded them. Thus they gained a mobility unknown to their enemies, who were encumbered with tents and all sorts of baggage. When the revolutionary war had produced, in Napoleon, the man who reduced this new mode of warfare to a regular system, combined it with what was still useful in the old system, and brought the new method at once to that degree of perfection which Frederic had given to line-tactics—then the French were almost invincible, until their opponents had learnt from them, and organized their ar-

mies upon the new model. The principal features of this new system are: the restoration of the old principle that every citizen is liable, in case of need, to be called out for the defence of the country, and the consequent formation of the army, by compulsory levies, of greater or less extent, from the whole of the inhabitants; a change by which the numeric force of armies was at once raised to three-fold the average of Frederic's time, and might, in case of need, be increased to larger proportions still. Then, the discarding of camp utensils, and of depending for provisions upon magazines, the introduction of the bivouac and of the rule that war feeds war; the celerity and independence of an army was hereby increased as much as its numeric force by the rule of general liability to serve. In tactical organization, the principle of mixing infantry, cavalry, and artillery in the smaller portions of an army, in corps and divisions, became the rule. Every division thus became a complete army on a reduced scale, fit to act independently, and capable of considerable power of resistance even against superior numbers. The order of battle, now, was based upon the column; it served as the reservoir, from which sallied and to which returned, the swarms of skirmishers; as the wedge-like compact mass to be launched against a particular point of the enemy's line; as the form to approach the enemy and then to deploy, if the ground and the state of the engagement made it desirable to oppose firing-lines to the enemy. The mutual supporting of the 3 arms developed to its full extent by their combination in small bodies, and the combination of the 3 forms of fighting; skirmishers, line, and column, composed the great tactical superiority of modern armies. Any kind of ground, thereby, became fit for fighting in it; and the ability of rapidly judging the advantages and disadvantages of ground, and of at once disposing troops accordingly, became one of the chief requirements of a captain. And not only in the commander-in-chief, but in the subordinate officers, these qualities, and general aptness for independent command, were now a necessity. Corps, divisions, brigades, and detachments, were constantly placed in situations where their commanders had to act on their own responsibility; the battle-field no longer presented its long unbroken lines of infantry disposed in a vast plain with cavalry on the wings; but the single corps and divisions, massed in columns, stood hidden behind villages, roads, or hills, separated from each other by seemingly large intervals, while but a small portion of the troops appeared actually engaged in skirmishing and firing artillery, until the decisive moment approached. Lines of battle extended with the numbers and with this formation; it was not necessary actually to fill up every interval with a line visible to the enemy, so long as troops were at hand to come up when required. Turning of flanks now became generally a strategical operation, the stronger army placing itself

completely between the weaker one and its communications, so that a single defeat could annihilate an army and decide a campaign. The favorite tactical manœuvre was the breaking through the enemy's centre, with fresh troops, as soon as the state of affairs showed that his last reserves were engaged. Reserves, which in line-tactics would have been out of place and would have deducted from the efficiency of the army in the decisive moment, now became the chief means to decide an action. The order of battle, extending as it did in front, extended also in depth; from the skirmishing line to the position of the reserves the depth was very often 2 miles and more. In short, if the new system required less drill and parade-precision, it required far greater rapidity, exertions, and intelligence from every one, from the highest commander as well as the lowest skirmisher; and every fresh improvement made since Napoleon, tends in that direction.—The changes in the *matériel* of armies were but trifling during this period; constant wars left little time for such improvements the introduction of which requires time. Two very important innovations took place in the French army shortly before the revolution; the adoption of a new model of musket of reduced calibre and windage, and with a curved stock instead of the straight one hitherto in use. This weapon, more accurately worked, contributed a great deal toward the superiority of the French skirmishers, and remained the model upon which with trifling alterations the muskets in use in all armies up to the introduction of percussion locks, were constructed. The second was the simplification and improvement of the artillery by Gribeauval. The French artillery under Louis XV. was completely neglected; the guns were of all sorts of calibres, the carriages were old-fashioned, and the models upon which they were constructed not even uniform. Gribeauval, who had served during the 7 years' war with the Austrians, and there seen better models, succeeded in reducing the number of calibres, equalizing and improving the models, and greatly simplifying the whole system. It was with his guns and carriages that Napoleon fought his wars. The English artillery, which was in the worst possible state when the war with France broke out, was gradually, but slowly, considerably improved; with it originated the block-tail carriage, which has since been adopted by many continental armies, and the arrangement for mounting the foot artillerymen on the limbers and ammunition wagons. Horse artillery, invented by Frederic the Great, was much cultivated during Napoleon's period, especially by himself, and its proper tactics were first developed. When the war was over, it was found that the British were the most efficient in this arm. Of all large European armies, the Austrian is the only one which supplies the place of horse-artillery by batteries in which the men are mounted on wagons provided for the purpose.—The German armies still

kept up the especial class of infantry armed with rifles, and the new system of fighting in extended order gave a fresh importance to this arm. It was especially cultivated, and in 1838 taken up by the French, who felt the want of a long range musket for Algiers. The *tirailleurs de Vincennes*, afterward *chasseurs à pied*, were formed, and brought to a state of efficiency without parallel. This formation gave rise to great improvements in rifles, and by which both range and precision were increased to a wonderful degree. The names of Delvigne, Thouvenot, Minié, became celebrated thereby. For the totality of the infantry, the percussion lock was introduced between 1830 and 1840 in most armies; as usual, the English and the Russians were the last. In the mean time, great efforts were made in various quarters still further to improve small arms, and to produce a musket of superior range which could be given to the whole of the infantry. The Prussians introduced the needle gun, a rifle arm loaded at the breech, and capable of very rapid firing, and having a long range; the invention, originated in Belgium, was considerably improved by them. This gun has been given to all their light battalions; the remainder of the infantry have recently got their old muskets, by a very simple process, turned into Minié rifles. The English were the first this time to arm the whole of their infantry with a superior musket, viz. the Enfield rifle, a slight alteration of the Minié; its superiority was fully proved in the Crimea, and saved them at Inkermann.—In tactical arrangements, no changes of importance have taken place for infantry and cavalry, if we except the great improvement of light infantry tactics by the French *chasseurs*, and the new Prussian system of columns of companies, which latter formation, with perhaps some variations, will no doubt soon become general from its great tactical advantages. The formation is still 8 deep with the Russians and Austrians, the English have formed 2 deep ever since Napoleon's time; the Prussians march 8 deep, but mostly fight 2 deep, the 8d rank forming the skirmishers and their supports; and the French, hitherto formed 8 deep, have fought 2 deep in the Crimea, and are introducing this formation in the whole army. As to cavalry, the Russian experiment of restoring the dragoons of the 17th century and its failure have been mentioned.—In artillery, considerable improvements of detail and simplification of calibre, and models for wheels, carriages, &c., have taken place in every army. The science of artillery has been greatly improved. Yet no considerable changes have taken place. Most continental armies carry 6 and 12-pounders; the Piedmontese 8 and 16-pounders; the Spanish 8 and 12-pounders; the French, who hitherto had 8 and 12-pounders, are now introducing Louis Napoleon's so-called howitzer gun, a simple light 12-pounder, from which small shells are also fired, and which is to replace every other kind of field gun. The British have 8

and 6-pounders in the colonies, but in their armies sent out from England, now only use 9-pounders, 12-pounders, and 18-pounders. In the Crimea they even had a field battery of 32-pounders, but it always stuck fast.—The general organization of modern armies is very much alike. With the exception of the British and American, they are recruited by compulsory levy, based either upon conscription, in which case the men, after serving their time, are dismissed for life, or upon the reserve system, in which the time of actual service is short, but the men remain liable to be called out again for a certain time afterward. France is the most striking example of the first, Prussia of the second system. Even in England, where both line and militia are generally recruited by voluntary enlistment, the conscription (or ballot) is by law established for the militia should volunteers be wanting. In Switzerland, no standing army exists; the whole force consists of militia drilled for a short time only. The enlistment of foreign mercenaries is still the rule in some countries; Naples and the Pope still have their Swiss regiments; the French their foreign legion; and England, in case of serious war, is regularly compelled to resort to this expedient. The time of actual service varies very much; from a couple of weeks with the Swiss, 18 months to 2 years with the smaller German states, and 8 years with the Prussians, to 5 or 6 years in France, 12 years in England, and 15 to 25 in Russia. The officers are recruited in various ways. In most armies there are now no legal impediments to advancement from the ranks, but the practical impediments vary very much. In France and Austria a portion of the officers must be taken from the sergeants; in Russia the insufficient number of educated candidates makes this a necessity. In Prussia the examination for officers' commissions, in peace, is a bar to uneducated men; in England advancement from the ranks is a rare exception. For the remainder of the officers, there are in most countries military schools, though with the exception of France, it is not necessary to pass through them. In military education the French, in general education the Prussian officers are ahead; the English and the Russians stand lowest in both. As to the horses required, we believe Prussia is the only country in which the equine population too is subject to compulsory levies, the owners being bought off at fixed rates. With the exceptions named above, the equipment and armament of modern armies is now everywhere nearly the same. There is, of course, a great difference in the quality and workmanship of the material. In this respect, the Russians stand lowest, the English, where the industrial advantages at their command are really made use of, stand highest. The infantry of all armies is divided into line and light infantry. The 1st is the rule, and composes the mass of all infantry; real light infantry is everywhere the exception. Of this latter, the French have at present decidedly

the best in quality and a considerable number: 21 battalions of chasseurs, 9 of Zouaves, and 6 of native Algerian tirailleurs. The Austrian light infantry, especially the rifles, are very good, too; there are 32 battalions of them. The Prussians have 9 battalions of rifles and 40 of light infantry; the latter, however, not sufficiently up in their special duty. The English have no real light infantry, except their 6 battalions of rifles, and are, next to the Russians, decidedly the least fit for that kind of duty. The Russians may be said to be without any real light infantry, for their 6 rifle battalions vanish in their enormous army.—Cavalry, too, is everywhere divided into heavy and light. Cuirassiers are always heavy, hussars, chasseurs, chevaux-legers, always light horse. Dragoons and lancers are in some armies light, in others heavy cavalry; and the Russians would also be without light cavalry were it not for the Cossacks. The best light cavalry is undoubtedly that of the Austrians, the national Hungarian hussars and Polish hussars. The same division holds good with artillery, with the exception of the French, who as stated now have only one calibre. In other armies there are still light and heavy batteries, according to the calibres attached to them. Light artillery is still subdivided in horse and foot, the 1st especially intended to act in company with cavalry. The Austrians, as stated, have no horse artillery; the English and French have no proper foot-artillery, the men being carried on the limbers and ammunition wagons.—The infantry is formed into companies, battalions, and regiments. The battalion is the tactical unit; it is the form in which the troops fight, a few exceptional cases left aside. A battalion, therefore, must not be too strong to be commanded by the voice and eye of its chief, nor too weak to act as an independent body in battle, even after the losses of a campaign. The strength, therefore, varies from 600 to 1,400 men; 800 to 1,000 forms the average. The division of a battalion into companies has for its object the fixing of its evolutionary subdivisions, the efficiency of the men in the details of the drill, and the more commodious, economical administration. Practically, companies appear as separate bodies in skirmishing only, and with the Prussians, in the formation in columns of companies, where each of the 4 companies forms columns in 3 platoons; this formation presupposes strong companies, and they are in Prussia 250 strong. The number of companies in a battalion varies as much as their strength. The English have 10, of from 90 to 120 men, the Russians and Prussians 4 of 250 men, the French and Austrians 6 of varying strength. Battalions are formed into regiments, more for administrative and disciplinary purposes and to insure uniformity of drill, than for any tactical object; in formations for war, therefore, the battalions of one regiment are often separated. In Russia and Austria there are 4, in Prussia 3, in France 2 service

battalions, beside depots to every regiment; in England, most regiments are formed, in peace, of but 1 battalion. Cavalry is divided into squadrons and regiments. The squadron from 100 to 200 men, forms the tactical and administrative unity; the English alone subdivide the squadron, for administrative purposes, into 2 troops. There are from 3 to 10 service squadrons to a regiment; the British have, in peace, but 8 squadrons, of about 120 horse; the Prussians 4 of 150 horse; the French 5 of 180 to 200 horse; the Austrians 6 or 8 of 200 horse; the Russians 6 to 10 of 150 to 170 horse. With cavalry the regiment is a body of tactical significance, as a regiment offers the means to make an independent charge, the squadrons mutually supporting each other, and is for this purpose formed of sufficient strength, viz., between 500 and 1,600 horse. The British alone have such weak regiments that they are obliged to put 4 or 5 of them to 1 brigade; on the other hand, the Austrian and Russian regiments in many cases are as strong as an average brigade. The French have nominally very strong regiments, but have hitherto appeared in the field in considerably reduced numbers, owing to their poverty in horses. Artillery is formed in batteries; the formation in regiments or brigades in this arm is only for peace purposes, as almost in every case of actual service the batteries are sure to become separated, and are always used so. Four guns is the least number, and the Austrians have 8; the French and English 6 guns per battery. Riflemen or other real light infantry are generally organized in battalions and companies only, not in regiments; the nature of the arm is repugnant to its reunion in large masses. The same is the case with sappers and miners, they being, beside, but a very small portion of the army. The French alone make an exception in this latter case; but their 8 regiments, sappers and miners, count only 6 battalions in all. With the regiment the formation of most armies in time of peace is generally considered complete. The larger bodies, brigades, divisions, army-corps, are mostly formed when war breaks out. The Russians and Prussians alone have their army fully organized and the higher commands filled up, as if for actual war. But in Prussia this is completely illusory, unless at least a whole army-corps be mobilized, which supposes the calling in of the landwehr of a whole province; and if in Russia the troops are actually with the regiments, yet the late war has shown that the original divisions and corps very soon got mixed, so that the advantage gained from such a formation is more for peace than for war.—In war, several battalions or squadrons are formed into a brigade; from 4 to 8 battalions for infantry, or from 6 to 20 squadrons for cavalry. With large cavalry regiments these latter may very well stand in lieu of brigade; but they are very generally reduced to smaller strength by the detachments they have to send to the divisions. Light and line infantry may

with advantage be mixed in a brigade, but not light and heavy cavalry. The Austrians very generally add a battery to each brigade. A combination of brigades forms the division. In most armies, it is composed of all the 3 arms, say 2 brigades of infantry, 4 to 6 squadrons, and 1 to 8 batteries. The French and Russians have no cavalry to their divisions, the English form them of infantry exclusively. Unless, therefore, these nations wish to fight at a disadvantage, they are obliged to attach cavalry (and artillery respectively) to the divisions whenever the case occurs; which is easily overlooked or often inconvenient or impossible. The proportion of divisionary cavalry, however, is everywhere but small, and therefore the remainder of this arm is formed into cavalry divisions of 2 brigades each, for the purpose of reserve cavalry. Two or 3 divisions, sometimes 4, are, for larger armies, formed into an army-corps. Such a corps has everywhere its own cavalry and artillery, even where the divisions have none; and, where these latter are mixed bodies, there is still a reserve of cavalry and artillery placed at the disposal of the commander of the corps. Napoleon was the first to form these, and, not satisfied therewith, he organized the whole of the remaining cavalry into reserve cavalry-corps of 2 or 3 divisions of cavalry with horse-artillery attached. The Russians have retained this formation of their reserve cavalry, and the other armies are likely to take it up again in a war of importance, though the effect obtained has never yet been in proportion to the immense mass of horsemen thus concentrated on one point. Such is the modern organization of the fighting part of an army. But, in spite of the abolition of tents, magazines, field-bakeries, and bread-wagons, there is still a large train of non-combatants and of vehicles necessary to insure the efficiency of the army in a campaign. To give an idea of this, we will only state the train required, according to the existing regulations, for 1 army-corps of the Prussian service:—

Artillery train: 6 park columns of 30 wagons, 1 laboratory do., 6 wagons.

Pontoon train: 34 pontoon wagons, 5 tool wagons, 1 sloop.

Infantry train: 116 wagons, 108 team horses.

Medical train: 50 wagons (for 1,600 or 2,000 sick).

Reserve commissariat train: 150 wagons.

Reserve train: 1 wagon, 75 reserve horses.

In all, 403 wagons, 1,791 horses, 3,000 men.

To enable the commanders of armies, army-corps and divisions to conduct, each in his sphere, the troops intrusted to him, a separate corps is formed in every army except the British, composed of officers exclusively, and called the staff. The functions of these officers are to reconnoitre and sketch the ground on which the army moves or may move; to assist in making out plans for operations, and to arrange them in detail so that no time is lost, no confusion arises, no useless fatigue is incurred by the troops. They are, therefore, in highly important positions, and ought to have a thoroughly finished military education, with a full knowl-

edge of the capabilities of each arm on the march and in battle. They are accordingly taken in all countries from the most able subjects, and carefully trained in the highest military schools. The English alone imagine any subaltern or field-officer selected from the army at large is fit for such a position, and the consequence is that their staffs are inferior, and the army incapable of any but the slowest and simplest manoeuvres, while the commander, if at all conscientious, has to do all the staff work himself. A division can seldom have more than one staff-officer attached, an army-corps has a staff of its own under the direction of a superior or a staff-officer, and an army has a full staff, with several generals, under a chief who, in urgent cases, gives his orders in the name of the commander. The chief of the staff, in the British army, has an adjutant-general and a quartermaster-general under his orders; in other armies the adjutant-general is at the same time chief of the staff; in France the chief of the staff unites both capacities in himself, and has a different department for each under his orders. The adjutant-general is the chief of the *personnel* of the army, receives the reports of all subordinate departments and bodies of the army, and arranges all matters relative to discipline, instruction, formation, equipment, armament, &c. All subordinates correspond through him with the commander-in-chief. If chief of the staff at the same time, he cooperates with the commander in the formation and working out of plans of operation and movements for the army. The proper arrangement of these in detail is the department of the quartermaster-general; the details of marches, cantonments, encampments, are prepared by him. A sufficient number of staff-officers are attached to head-quarters for reconnoitring the ground, preparing projects as to the defence or attack of positions, &c. There is, beside, a commander-in-chief of the artillery, and a superior engineer-officer for their respective departments; a few deputies to represent the chief of the staff on particular points of the battle-field, and a number of orderly officers and orderlies to carry orders and despatches. To the head-quarters are further attached the chief of the commissariat, with his clerks, the paymaster of the army, the chief of the medical department, and the judge-advocate, or director of the department of military justice. The staffs of the army-corps and divisions are regulated on the same model, but with greater simplicity and a reduced *personnel*; the staffs of brigades and regiments are still less numerous, and the staff of a battalion may consist merely of the commander, his adjutant, an officer as paymaster, a sergeant as clerk, and a drummer or bugleman. To regulate and keep up the military force of a great nation, numerous establishments, beside those hitherto named, are required. There are recruiting and remounting commissioners, the latter often connected with the administration of national establishments for the breeding of horses, milita-

ry schools for officers and non-commissioned officers, model battalions, squadrons, and batteries, normal riding schools, and schools for veterinary surgeons. There are in most countries national foundries and manufactories for small arms and gunpowder; there are the various barracks, arsenals, stores, the fortresses with their equipments and the staff of officers commanding them; finally, there are the commissariat and general staff of the army, which, for the whole of the armed force, are even more numerous and have more expensive duties to perform than the staff and commissariat of a single active army. The staff especially has very important duties. It is generally divided into a historical section (collecting materials relative to the history of war, the formation of armies, &c., past and present), a topographical section (intrusted with the collection of maps and the trigonometrical survey of the whole country), a statistical section, &c. At the head of all these establishments, as well as of the army, stands the ministry of war, organized differently in different countries, but comprising, as must be evident from the preceding observations, a vast variety of subjects. As an example we give the organization of the French ministry of war. It comprises 7 directions or divisions: 1, of the *personnel*; 2, of the artillery; 3, of the engineers and fortresses; 4, of administrative affairs; 5, of Algeria; 6, war depot (historical, topographical, &c., and sections of the staff); 7, finances of the war department. Immediately attached to the ministry are the following consultative commissions, composed of general and field-officers and professional men, viz.: the committees of the staff of infantry, of cavalry, of artillery, of fortification, of medical affairs, and the commissions for veterinary science and for public works. Such is the vast machinery devoted to recruiting, remounting, feeding, directing, and always reproducing a modern first class army. The masses brought together correspond to such an organization. Though Napoleon's grand army of 1812, when he had 200,000 men in Spain, 200,000 in France, Italy, Germany, and Poland, and invaded Russia with 450,000 men and 1,800 guns, has never yet been equalled; though we shall most likely never see such an army again united for one operation as these 450,000 men, yet the large continental states of Europe, Prussia included, can each of them raise an armed and disciplined force of 500,000 men, and more; and their armies, though not more than from $1\frac{1}{2}$ to 3 per ct. of their population, have never yet been reached at any former period of history.—The system of the United States bases the defence of the country substantially on the militia of the different states, and on volunteer armies raised as occasion demands; the standing military force, employed mainly in preserving order among the Indian tribes of the West, consisting, according to the report of the secretary of war for 1857, of only about 18,000 men.

ARNAL, a small Portuguese village about 4

miles N. W. from Batalha and 8 miles S. W. from Leiria, celebrated for the remains of a Roman villa discovered there in Aug. 1857, by the Rev. Dr. Patrick B. Russell, rector of the college of Corpo Santo of Lisbon. This gentleman, while examining the geological formation and character of the country, observed in a field some portion of tessellated pavement, which he thought might be of Roman origin. He purchased the right to excavate, and set laborers to work. They at length brought into view a most interesting specimen of Roman mosaic pavement, of an extent much greater than is usually found, and at a depth of about 3 feet below the surface. This discovery is doubly interesting, as the pavement constitutes the flooring of a house or villa, divided into several chambers, the separating walls of which, as well as the external walls of the house, still remain to the height of about $1\frac{1}{2}$ foot. The country around Arnal is of great fertility, and abounds with coal and iron ore. The recent discovery of coal in the valley of Batalha, lends a new interest to the district. The Romans had smelting establishments at Porto da Mo, Alqueida, Val d'Orta, Necessidade, and other places, including Arnal. Some pieces of the pigment, 6 inches long, 4 wide, and 3 thick, have been found in the mounds of slag, most of which are now covered by venerable oaks.

ARNALL, WILLIAM, an English attorney's clerk, born 1715, died in 1741. He was a political writer in the pay of the English minister, Sir Robert Walpole. It appears from the report of a secret committee, that in 4 years he received £10,997 6s. 8d. for his pamphlets; yet he died in a desponding frame of mind, and in debt.

ARNAO, VICENTE GONZALEZ, Spanish lawyer and writer, born at Madrid. Joseph Bonaparte made him secretary of the council of state in 1809. On the evacuation of Madrid he retired to France, and remained in that country until 1831. On his return he was appointed a member of the royal council of Spain and the Indies. He translated Humboldt's work on Mexico into Spanish.

ARNAOUTS, Albanians employed in the Turkish military service as irregulars. They are brave, good marksmen, and expert in the use of arms, but reckless, brutal, and mutinous.

ARNAUD, FRANÇOIS THOMAS MARIE BACULARD D', a French dramatist born at Paris, Sept. 18, 1718, died there Nov. 8, 1806. While still very young he wrote 3 tragedies, 2 of which brought him into contact with Voltaire, and subsequently with Frederic the Great, who took a fancy to Arnaud, made him his literary correspondent at Paris, and invited him to come to Berlin. Voltaire, on being informed that Frederic flattered Arnaud at his expense, took his revenge upon poor Arnaud, who was accordingly ridiculed in Paris, while he was lionized in Berlin. After having swallowed with good grace the bad French of the Prussian king, Arnaud betook himself to Dresden, where, for some time,

he resided as secretary of legation. On his return to France, his novels and plays found a large circle of readers among people with a strong bias for the gloomy and terrible. But he did not reap the benefits of his success, as on leaving the prison, into which, during the revolution, he had been thrown, he was in very reduced circumstances, and had to struggle with poverty from that time until his death.

ARNAUD, Mademoiselle H., a French authoress, better known by her *nom de plume* of "Madame Charles Reybaud." Her writings, consisting mostly of novels, short tales or *feuilletons* for the Paris press, have obtained a considerable reputation in France. They are marked by felicitous pictures of life and nature in various times and countries. *Les anciens couvents de Paris*, one of her latest works, has been translated into English, and affords some striking pictures of monastic life. Among her numerous publications, those which have been most highly esteemed are *Mlle. de Chazeuil*, *Madame de Rieux*, *Marie d'Enambus*, *Les deux Marguerites*, *Gabrielle*, *Mélie*, and *Le dernier oblat*.

ARNAULD. A remarkable French family of this name originated in Provence, where it occupied a prominent position as early as the 12th century. A branch of this family removed to Auvergne in the 14th century. Three members of this Auvergne branch are especially worthy of notice. I. ANTOINE, an advocate, born at Paris 1560, died there Dec. 29, 1619, raised himself to celebrity by a speech against the Jesuits, in favor of the university of Paris (1594). He was a Catholic, though the Jesuits accused him of being a Huguenot. He was the father of 20 children. II. ROBERT, eldest son of the preceding, born at Paris in 1588, died at the Port Royal, Sept. 27, 1674. Like his father, he distinguished himself in a plea for the university of Paris, against the Jesuits, which has been much circulated in France since. He also published several other works against the Jesuits, who accused him of being a Huguenot. It is certain that he was violently opposed to the league of 1576. He was a sincere and upright man. Balzac says of him "he was not ashamed of Christian virtues, nor proud of moral ones." At the age of 55 he retired to the convent of Port Royal, where he spent the remainder of his life in solitude. Here he turned his attention more undividedly to theology, and wrote and translated many works. III. ANTOINE, 20th son of the same father with the preceding, born at Paris, Feb. 6, 1612, died there Aug. 6, 1694. He inherited from his father a love of polemical theology, and a violent hatred of the Jesuits, against whom he early took the field, and never quitted it till the day of his death. This body, after their expulsion from France through the labors and influence of the father, returned only to find that the son reigned in his stead. He first studied law, but was ordained a priest in 1641. In 1643 we find him making that attack upon the Jesuits, the publi-

cation of which has become an era in the history of the eucharist, *De la fréquente communion*, which was followed by his admission to the Sorbonne. Next he published his severe strictures on Jesuitic morals. Jansenism had early enlisted his attention, and he now became its most powerful advocate. The Jansenist speculations on the intricate subjects of divine grace and human freedom, were perfectly suited to his mind. He soon put himself at the head of the Port Royal, although those eminent scholars, Nicole, Pascal, and Perrault, had preceded him. From this time he was the great oracle of Jansenism. He was now expelled from the Sorbonne for his controversial attitude, and 80 fellow-doctors, refusing to approve the expulsion, followed him. From his retirement at the Port Royal, he hurled more vigorously than ever the bolts of strife. Pascal's famous *Lettres provinciales* added new fuel to the flames. Arnauld was the soul of these letters, furnishing to Pascal the materials and facts which he adroitly used against the Jesuits. The contention ran so high, and the Jansenist party were acquiring such influence, that Clement IX. thought best to secure the peace of the church by a compromise, called the peace of Clement. This conciliation so softened the asperities of Arnauld's temper, that he followed it with a work on the eucharist, dedicated to the pope. This furnished him a new antagonist in the reformed clergy, who violently attacked him. He replied in an elaborate work against the Calvinistic doctrine of justification, which he charged with reversing the teachings of Christ. He did not, meanwhile, neglect his old antagonists, the Jesuits, but published 8 volumes of strictures on their casuistry. Through the influence of Harlay with the king, Louis XIV., an order was issued for his arrest. To avoid this, Arnauld fled to Brussels. Here he wrote a defence of the Jesuits, his old antagonists, from the charges of Oates's conspiracy. Here also he attacked the prince of Orange, William III., styling him Absalom, Herod, and Cromwell. From Brussels he also took up the gauntlet against the philosophy of Malebranche, and wrote so bitterly as to sour and alienate that philosopher, who had before been his friend. Himself a Cartesian, Arnauld was a personal friend of Leibnitz, and entertained the hope of converting him. In all the bitterness of the contentions in which a restless spirit involved him, he seems to have had a frankness and sincerity which never failed to secure personal friends among his opponents; and even when engaged in the exceedingly difficult triangular contest with Jesuits and Reformers, and under the disadvantage of an expulsion from the Sorbonne, he managed to preserve the respect of all, and the personal admiration of many on both sides. He was one of the most learned men of his age, sincere, but of an independent mind, simple in his habits, exemplary in his conduct, and a Catholic in spirit. The Jesuits denominated him "the great Arnauld."

ARNAULT, VINCENT ANTOINE, a French poet, born at Paris, Jan. 1, 1766, died near Havre, Sept. 16, 1834; became first known to fame by 2 tragedies, *Marius à Minturnes* and *Luorèca*. On the revolutionary outbreak in Sept. 1792, he went to London and Brussels, and on his return, in 1793, he was arrested; but as soon as it transpired that he was the author of *Marius à Minturnes*, he was set free. In 1797 Bonaparte sent him on a mission to the Ionian islands; and on his return, in 1798, he was made prisoner by the English, but soon recovered his liberty. In 1799 he produced, in Paris, a tragedy suggested to him by his residence at Venice, which was very favorably received, especially by Napoleon himself, before whom he delivered several lectures on Venice. He became, in the same year, member of the French academy; in 1805 he was elevated to the vice-presidency, and in 1808 to the principal secretaryship of the council of the university. All these offices were taken from him after the emperor's downfall, but restored to him during the Hundred Days.

ARND, JOHANN, a German theologian, born at Ballenstedt, in the duchy of Anhalt-Bernburg, Dec. 27, 1555, died at Celle, May 11, 1621. After having studied chemistry and medicine in several German universities, he applied himself to theology, and was pastor successively at Paderborn and Quedlinburg. In 1599 he was appointed preacher to the court at Brunswick. In 1611 he was presented by the duke of Luneburg to the church at Celle, and he soon after became superintendent of all the churches of the duchy, in which office he remained till his death. His writings are marked by great fervor of devotion, and he has been called the Fenelon and the A. Kempis of the Protestant church. His principal work on "True Christianity" has been translated into almost all languages, and is esteemed alike by scholars and people of humble life. Its piety approaches to mysticism, and it was therefore attacked, during the lifetime of its author, as a dangerous and heretical production. The limited resources of Arnd, joined to the fact that he gave constantly and liberally to the poor, gave rise to a belief, in that age of astrology and alchemy, that he had discovered at last the philosopher's stone, the long-sought secret of making gold.

ARNDT, ERNST MORITZ, a German patriot, and professor of history at the university of Bonn, born Dec. 26, 1769, at Schoritz, on the island Rügen. He studied theology and philosophy at Greifswald and Jena, and after travelling over Europe was appointed professor at Greifswald, where he soon published his "History of Serfdom in Pomerania and Rügen," which roused the wrath of some members of the Pomeranian nobility. In 1807 appeared the first volume of his "Spirit of the Times," containing his attack against Napoleon. Napoleon was then at the zenith of his power, and the German princes trembled at the very whisper of his voice. Arndt had to pay the penalty of his courage, and was expelled from the

country. He betook himself to Stockholm, and, under a feigned name, supported himself by teaching languages. In 1810 he ventured, under this incognito, back to Greifswald, but, on hearing of the Russian campaign, he proceeded in 1812 to St. Petersburg, and published pamphlet after pamphlet to rouse the public mind of Europe from its lethargy. Stein, the celebrated minister, was the first to sympathize with his views, and assisted him as much as he could. His cry was, if Napoleon is successful in Russia, Germany is undone. At this time he wrote his book defining the Rhine as a German river, and also his stirring national songs. In 1818 he became professor of modern history at Bonn, but he had hardly been lecturing a year when he was compelled to withdraw from the university. His liberal ideas had again given offence at Potsdam. He was tried for treason, but no verdict could be found against him; yet it was not till 20 years afterward, in 1840, that the king would allow the professor to teach history again. In 1848 he was sent as deputy to the Frankfort parliament by the 18th electoral district of Rhenish Prussia; he retained his seat until May 21, 1849, when he withdrew from parliament with the whole constitutional party, which was in favor of an hereditary empire. Arndt's first wife died in 1801. His second wife, to whom he was married in 1817, is the daughter of the celebrated Schleiermacher. He is the author of various historical and other works. His most popular song is his *Was ist des Deutschen Vaterland?*

ARNE, THOMAS AUGUSTINE, an English composer of music, born in London in 1710, died March 5, 1778. His father, an upholsterer, gave him a good education at Eton, and bound him apprentice to an attorney, with whom he remained three years. Young Arne, however, manifested so decided a taste for music, which he gratified in secret, and sometimes in the most whimsical manner, that his acquirements in the law were but moderate, while in his favorite art, although comparatively unaided, he made rapid progress. The consent of the father, who accidentally became aware of the bent of his son's genius, having been obtained, he devoted himself exclusively to musical composition, and in 1731 set to music Addison's "Rosamond" and Fielding's "Tom Thumb," under the name of the "Opera of Operas," both of which were received with much favor. In 1738 he wrote the music to Milton's "Comus," a work full of original and sprightly melodies, the production of which formed an era in the history of English music, and firmly established the reputation of the composer. During the next twenty years he wrote operas for Drury lane theatre, oratorios, and a vast number of songs—adding very considerably to the stock of standard English musical compositions. In 1763 his most famous work, "Artaxerxes," an opera after the Italian style, was produced, and for many years held a prominent place on the

lyric stage. His other most successful works were the "Judgment of Paris," "Eliza," "Britannia," a musical farce, entitled "Thomas and Sally," the "Fairies," and the "Stratford Jubilee." His oratorios, owing to the competition of Handel's works, were comparative failures. As a composer of songs, Dr. Arne was unsurpassed by any English writer since the time of Purcell; and many of them, such as "Rule Britannia," "The Soldier Tired," and some of the Shakespeare songs, have maintained their hold upon popular favor to the present day. He married in 1740 Cecilia Young, afterward a distinguished singer, and in 1769 received from the university of Oxford the degree of doctor in music. He died in the Roman Catholic faith. Dr. Arne had neither the vigor of Purcell nor the grandeur and simplicity of Handel; but his melodies are always pleasing, elegant, and appropriate, and his harmonies, without showing great learning, have a fullness and variety which amply satisfy the hearer.

ARNHEM, also ARNHEIM, a fortified town of the Netherlands, capital of the province of Gelderland, on the right bank of the Rhine, over which river it is approached by a bridge of boats. It is connected with Utrecht by railway. Its population in 1850 was 18,671. It has a school of art, a gymnasium, and several learned societies. It is a town of Roman origin (*Arenanum*). In a charter of Otho I., 996, it is spoken of as a village. In 1283 it was chosen by Otho III., duke of Gelderland, as the ducal place of residence, and strongly fortified. In 1473 it was conquered by Charles the Rash of Burgundy, in 1493 by Karl Egmont, duke of Gelderland, or Gueldres, and in 1505 by the Spaniards, but was recaptured by Duke Karl. After his death it went to the duchy of Cleves, and then with Gelderland to Charles V. of Spain and Germany. In 1585 the Dutch captured it, and it thenceforward belonged to the United Provinces. In 1672 the French conquered it, but abandoned it in 1674. In 1794 it fell again into the hands of the French invading army, and in 1813 was taken by storm by Bulow and his Prussians. In 1586 Sir Philip Sidney, the English knight, scholar, and poet, died here of a wound received in the battle of Zutphen.

ARNICA, a genus of plants of the natural order *compositæ*. It grows in the mountainous districts of the north and middle of Europe, blossoming in June and July. In Germany the flowers, leaves, and root, are all employed in medicine, principally in cases of low fevers and nervous diseases. A tincture, an extract, an essence of the flowers, and a vinegar, are all prepared from it. The tincture is the common form of the application for wounds and bruises; it was first introduced by the homœopaths, but has now come into general use. It is a powerful preparation, and, having poisonous properties, should be kept with caution.

ARNIM, LUDWIG ACHIM VON, born Jan. 26, 1781, at Berlin, died Jan. 21, 1881. He was of

an old German noble family, whose name can be traced back into the 10th century, and was one of the founders of the romantic school in German literature. This school, now nearly extinct in its more respectable representatives, was a reaction against a certain intellectual, critical, and sceptical bias of the classical school in poetry, and of the critical philosophy of Kant, Fichte, and their cotemporaries. It strove to reestablish the ancient depth of feeling instead of the existing superficiality of judgment, the beautiful traditions of the middle ages instead of the modern levelling spirit, old fairy tales, magic secrets, mediæval sentiments and superstitions instead of the enlightenment of the century, indistinctness and boundless liberty of poetical forms and expressions instead of the classical severity and purity of style, and, in general, the rights of the heart and affections, and the infinite freedom of the individual against the monarchy of the intellect and reason. This school undoubtedly had its good qualities. The Swabian branch of it, represented by Uhland, Schwab, Kerner, Moericke, Pfizer, and others, has the eminent merit of enriching German poetry with the sweetest original lyrics. The northern branch, represented by Arnim, Tieck, the two Schlegels, La Motte Fouqué, and others, had a more transitory career. It served, however, to remind the literary world of the dangers of over-cultivation of the intellect, and of the almost forgotten treasures of ancient German and Teutonic popular poetry. Among the rubbish of this ancient literature, hundreds of pure gems of genuine poetry were exhumed from their graves, and brought to the appreciation of modern taste. Arnim was the most richly gifted among the northern Romanticists, but at the same time the most unpolished and formless. The more prominent of his writings are *Des Knaben Wunderhorn* (3 vols., 1806), *Wintergarten* (1809), *Halle und Jerusalem*, *Studentenspiel und Pilgerabenteuer* (1811), *Die Kronenwächter* (1817). His complete works were edited by W. Grimm, Berlin, 1839-'46.—ELIZABETH VON (Bettina), wife of the former, and sister of the poet Clemens Brentano, was born in Frankfort-on-the-Main in 1785. Her education in almost unrestrained liberty, her friendship with a canoness, Fräulein Günderode, who committed suicide on account of an unhappy love for the philologist Orenzer, and her peculiarly sensitive nature, have made her one of the most celebrated and remarkable women of the age. Her two works, *Goethe's Briefwechsel mit einem Kinde* (3 vols., Berlin, 1835), translated into English by herself, a correspondence with Goethe, in which she courts the poet, at that time 60 years old, with a kind of Platonic, child-like, sometimes even affected love, while he patronizes her fancies with a reserved condescension; and *Die Günderode* (2 vols., Berlin, 1840, partly translated by Margaret Fuller), a correspondence between herself and that lady, exhibit an almost intuitive insight into nature, an

idoltrous appreciation of its beauties, a rich lyrical sense, a fascinating, naive, childish feeling, a reflection sometimes profound, sometimes full of affectation, and a frank hatred of every thing established, tyrannical, and anti-liberal. Amiable even in her faults, which, with the exception of her wilful style, are the faults of her age in the excessive valuation of merely literary merits, and fascinating in personal intercourse, she made her house in Berlin for some time the great attraction of that metropolis, where the most complete liberty of opinion reigned, and under the name of "Bettina," even in her old age, assembled around herself the literary magnates of the day. She has since been active as a politico-social author, but without great success.

ARNO, a celebrated river of Tuscany, rises in Mount Falterone in the Apennines, 6 miles N. of Prato Vecchio, flows S. to Ponte a Buriano, thence N. W. to Pontassieve, where it receives the Sieve, then follows a westerly course through Florence and Pisa, to 7 miles below the latter city, where it flows into the Mediterranean, through a channel cut for it in 1603; length, 150 miles. It is navigable for small vessels from the sea to Florence, but further is liable to be obstructed by floods and droughts. To guard against the former, it has been embanked for the greater part of its course. The valley through which the Arno flows, between Florence and Pisa, is the very garden of Italy, and is famous for its beauty.

ARNOBIUS, an African rhetorician, born in the 3d century in Sicca Veneria (Keff), near Carthage. He was a pagan, and a violent opponent of Christianity (which had been introduced into Numidia as early as A. D. 250), until, tradition says, he was warned in a dream to embrace the new religion. There is some reason to doubt the tradition, and to ascribe his conversion to an independent and rational investigation of the doctrine of the gospels. On his conversion he applied to the bishop of Sicca for admission to the church. The bishop regarded him with distrust, and desired some proof of the sincerity of a man who had been so zealous a defender of paganism. Arnobius, therefore, wrote the famous treatise entitled *Adversus Gentes*, in which he gives proof of his sincerity, and zeal for Christianity, by exposing the follies and fallacies of his former faith. There has been much question among theologians and chronologists, as to when this work was written. Neander considers its allusions to circumstances proof that it was written later than A. D. 303. Theologians as greatly disagree on the general character of the work. Some discern in it the hand of a neophyte, who had no real apprehension of the faith he had espoused; while others see in it the marks of profound philosophical investigation, and find it discordant with the prevalent expositions of Christianity, only because it was conducted independently and without prejudice. The *Adversus Gentes* inclines to Gnosticism, and Dual-

ism, in the conclusion that, since the Supreme Being would not have created so imperfect a work as the human soul, it must have been created by some inferior and imperfect being and in his image. Following out these speculations, Arnobius taught that immortality was not an attribute of the soul, but could only be acquired by effort to conquer evil, and rise to the supremacy of good. The Gnostic tendency is also seen in his treatment of the character of Christ. The work of Arnobius is interesting in a historical light, as an indication of the views which an independent neophyte would get in that day of Christianity by the study of the gospels, combined with the prevalent influences which surrounded him in Christian Africa. It also yields much valuable information to the student of mythology.

ARNOLD, BENEDICT, an officer in the American revolution, and a traitor to the cause of his country, born at Norwich, Connecticut, Jan. 8, 1740, died at London, June 14, 1801. His parentage was respectable, his education such as the common schools of the time afforded, and he was destined, by his friends, for a mercantile life. Apprenticed to druggists, he twice left them, and enlisted in the army, from which he deserted not without great danger. His disposition was little fitted for trade, and among his companions he was always noted for reckless spirit and daring as well as unprincipled conduct. Having embarked in business at New Haven as a druggist, he united to this pursuit trade with the West India islands, and was the owner of several small vessels, sometimes sailing them in person. In this mercantile enterprise, he, at one period, failed under rather suspicious circumstances. When the war of independence began with the battle of Lexington, Arnold, who was the commander of a militia company styled the "governor's guards," at once abandoned trade, and with his troops marched for Cambridge, the head-quarters of the Massachusetts committee of safety, and offered his services. They were accepted, he was commissioned as colonel, and, at his own instance, despatched on an expedition against Forts Ticonderoga and Crown Point, 2 very important posts held by the British troops. A party of "Green mountain boys," led by the famous Ethan Allen, had marched against Ticonderoga, and Arnold overtaking them, drew his commission from his pocket and attempted to take the command from Allen. Failing in this, he volunteered his services, and at the capture of the fort, marched into it by Allen's side. Shortly after this, he greatly distinguished himself by the seizure of St. John's, at the head of Lake Champlain, and with a small flotilla he annoyed the enemy in several other instances. But even at this early period he became involved in troubles of a pecuniary nature, which appeared to beset him during the whole of his military career, and in this instance with the Massachusetts committee of safety. They paid his drafts upon them with a reluctance indi-

eating suspicion of their worth. He now resigned in anger, but was very soon again engaged in an enterprise of much greater importance against the Canadas, and was appointed, in connection with Gen. Richard Montgomery, to the command of an expedition, whose object was the capture of Quebec. Arnold was well fitted for such a difficult enterprise, as his military genius was unquestionably equal, if not superior, to that of any other revolutionary officer. His forces embarked at Newburyport, and sailed for the Kennebec river, in Maine, leaving their vessels at a point near the present town of Gardiner. Thence their march lay through the wilderness toward Quebec, in the short and chilly days of autumn. In the face of continual dangers and obstacles, through pathless forests, over swollen and rapid rivers, suffering from cold, from hunger, from the treachery of guides, from the death and desertion of troops, Arnold held bravely on, cheering his men, conciliating the inhabitants, eluding the vigilance of the enemy. Not until Nov. 9 did he arrive on the banks of the St. Lawrence opposite to Quebec, having with him but 700 men. Joined by Montgomery, who had arrived by another route, the American forces attacked Quebec Dec. 31, 1776, but their numbers were too feeble to carry it by assault. Montgomery was killed before the city which he had assisted in taking under Wolfe's command, 16 years before. Arnold was very severely wounded in the leg. The enterprise against Quebec failed; Arnold retired to Montreal, where his fair fame was again sullied by dishonorable transactions connected with the traders of the place, whom he oppressed and despoiled. For this conduct he was much censured both before and after the retreat of the continental forces from Montreal, and it was doubtless the first important link in the chain of incidents which led to his final ruin. His gallant conduct, however, at the storming of Quebec, added to his skill and perseverance in forcing a march through the wilderness, won the approbation of congress and promotion to the rank of brigadier-general. Arnold could not remain idle, and he was appointed to the command of a small fleet on Lake Champlain, and Oct. 11, 1776, fought a desperate battle with a very superior force of the enemy. Arnold's flotilla consisted of but 16 little vessels; 3 schooners, 2 sloops, 8 galleys, and 8 gondolas. That of the enemy comprised 1 ship with 8 masts, 2 schooners, a radeau, 1 gondola, 20 gun boats, and 44 boats with provisions and troops. The action lasted from 12 until 5 o'clock, when the British drew off, and Arnold finding his forces too much crippled to attempt another battle, passed through the British line, at night, without discovery. The next morning, however, he was pursued, and the fight was renewed for 4 hours, with the utmost courage on Arnold's part, when, finding himself likely to be surrounded, he drove his galleys on shore, set fire to them with their

flags still flying, and was the last man to leave his vessels. He arrived safely with his men at Ticonderoga, and although not crowned with victory, his unflinching courage caused him to be regarded by his countrymen, as one of the first of American heroes. He was next stationed at Providence, the head-quarters of the eastern army, making preparations to attack the British, who had landed at Newport with large forces, and taken possession of the island. An attempt to dislodge them failed, from the inability of Arnold to raise troops in sufficient numbers to insure success. While engaged in this manner, the action of congress in creating 5 major-generals, all of them his juniors in rank, without naming him, caused him the most bitter mortification, and had great influence on his subsequent career. His brilliant exploits deserved reward, and it must be confessed that his treatment by congress in this instance was undeserved. From this moment he began to talk of the ingratitude of his country, and unprincipled as he was at all times, this incident led him to meditate revenge. Washington himself was much concerned at the course that congress adopted, and wrote a soothing letter to Arnold, entreating him not to resign or act hastily, as his merits would, sooner or later, be acknowledged. With this kind advice Arnold complied, but at length determined to visit head-quarters, and obtain permission to visit Philadelphia, and in person claim his full rank from congress. On his way from Providence through Connecticut, he fell in with Generals Silliman and Wooster, who had suddenly collected a body of 600 men, marching to meet the British force of 2,000 under Governor Tryon, who had landed near Fairfield, and was ravaging the country. In an engagement which ensued near Danbury, Arnold took part and greatly distinguished himself. He at one time had a horse shot under him, and a British soldier seeing that he was unhurt rushed forward to transfix him with his bayonet. Arnold sat still upon his fallen steed until the man came within range, when, drawing a pistol from his holsters, he shot him dead. Such cool bravery should at once have earned for him his just rank, but strange to say, congress, although it created him a major-general, still left him below the 5 others recently commissioned, and presented him with a richly caparisoned horse, a gift which did little to soothe his wounded feelings. He now took command, for a season, of the army gathered near Philadelphia, but always preferring active service was soon sent to join the northern army under command of Gates. In this capacity, he displayed his usual ability in an expedition to relieve Fort Stanwix, besieged by St. Leger, the British commander, with a large force of English, Canadians, and Indians. In the several battles of Bemis heights, Arnold bore a most distinguished part. In the first encounter, Sept. 19, 1777, he was prevented by Gates from assuming command nearly the whole day, while

Gates himself took no part in the strife. This conduct can only be explained by Gates's jealousy of Arnold. In the second battle, Oct. 7, he entered the field without Gates's permission, rushed into the thick of danger, and appeared almost beside himself. The day was closed by a brilliant manoeuvre, the enemy's works stormed, the Hessians driven from their encampment, while Arnold's horse was killed beneath him as he rode into the sally port, and his own leg shattered by a ball. He was removed to Albany, where he was confined to a sick bed from his wounds all the winter, while congress at last did him justice and allowed him full rank. In June, 1778, a few days after the British had evacuated Philadelphia, Washington appointed Arnold to the command of that city, as the state of his wound would not permit him to resume active duty. Washington, although he could not respect Arnold's private character, was ever the first to acknowledge and defend his public ability. In Philadelphia, his evil genius again appeared to beset him with like troubles to those in which he was involved with the Massachusetts committee of safety and the merchants of Montreal. He governed with a high hand, and ill-disguised mercenary motives. He became hated, he was mobbed, charges were preferred against him by the council of Pennsylvania, after he had, for 7 or 8 months, been creating discontent and trouble by his conduct. The whole matter was laid before congress, and it was decided that as Arnold was a United States officer he should be subject to a court-martial by a military tribunal, but it was not until after he had resigned his command at Philadelphia, March 18, 1779, not, indeed, until Jan. 26, 1780, that the trial was concluded, it having occupied several weeks. Although acquitted of actual criminal intent, he was adjudged to be reprimanded by the commander-in-chief, and the sentence, though mildly administered, roused within him a spirit that thirsted for vengeance.—He had conducted, with much skill, his own defence before the court, and with every appearance of sincerity used the following words: "Conscious of my own innocence and the unworthy methods taken to injure me, I can with boldness say to my persecutors in general, that in the hour of danger, when the affairs of America wore a gloomy aspect, when our illustrious general was retreating through New Jersey with a handful of men, I did not propose to my associates basely to quit the general, and sacrifice the cause of my country to my personal safety by going over to the enemy and making my peace." It was subsequently discovered that at the very instant of this speech he had been for 8 months in secret plotting with the enemy.—And now the scene of his great treason opens! Hated by many persons, loved by none, stung to the quick in mind, desperate in fortune—for his debts, owing to his extravagance, had accumulated enormously—baffled in his attempt to obtain a large sum of money from the French minister, he seemed

to be driven to such a pitch of frenzy that he could perceive only misery and disgrace by further attachment to the cause of his country, while traitorous desertion promised security and wealth. Another event, while he was stationed at Philadelphia, probably had great influence. This was his second marriage, to Miss Margaret Shippen, daughter of Mr. Edward Shippen, who was afterward chief justice of Pennsylvania. At that time, however, the family, one of the most distinguished in the state, was strongly attached to the tory interest. Miss Shippen was a great favorite with the British officers, and, no doubt, produced some bias on his mind after her union with him. She is described as eminently beautiful in person and character, and, though unconsciously swaying him after his faith to his country had begun to waver, no proof that she knew of his nefarious purposes has ever attached to her.—Arnold had solicited Washington for the command of West Point, on the Hudson river. Although the commander-in-chief at first expressed much surprise that an officer of such active disposition, now that he had recovered from his wounds, should be content to remain in garrison, Arnold plausibly overcame his scruples, and Aug. 8, 1780, took command of the fortress and established his head-quarters at a house on the opposite bank to West Point, and a mile or two below. This house had belonged to Col. Beverley Robinson, who was the son of the former celebrated speaker of the house of burgesses of Virginia. He had been a friend of Washington in youth, but had joined the royal cause, and his property lying about West Point was confiscated by the state of New York. West Point was the strongest and most important post in the United States, considered as the American Gibraltar, and "the key of communication between the eastern and southern states," so that when Arnold had fully committed himself to the wickedness of treason he wished to deliver into the hands of the enemy a trust of such importance as would insure almost certain ruin to the colonial cause, and for himself a splendid remuneration.—The treasonable correspondence between Arnold and Sir Henry Clinton, the British commander-in-chief, had now been carried on for 18 months with entire secrecy, and in such a manner as to excite no suspicion in case letters should miscarry. They were written in disguised hands, Arnold using the signature of "Gustavus," and Maj. John André, who in fact corresponded for Sir Henry Clinton, signing as "John Anderson." One specimen of this correspondence will show its art and purport. Arnold, writing to André, 1780, a month before the treason was discovered, says (alluding to himself in the third person, and hoping soon for an interview), "You will be able to settle your commercial plan, I hope, agreeably to both parties. He is still of opinion that his first proposal is by no means unreasonable, and makes no doubt when he has a conference with you that you will close with it. He expects that

you will be fully authorized from your house, that the risks and profits of the copartnership may be clearly understood. A speculation might at this time be easily made, and to some advantage, with ready money." From information given to Sir Henry Clinton during the correspondence, and which proved perfectly correct, he finally discovered that the traitor was no less a personage than Gen. Arnold, who, a few days before obtaining West Point, apprised the British commander that he should soon be in service again, ready to surrender himself under circumstances which should confer the greatest benefit on the royal cause. The plot was now ripe, and Arnold only wished to have a personal interview with some one "of his own mensuration," in order that every point should be settled by debate which would have been impossible in correspondence. He fixed upon Major André, who was a friend and even correspondent of Mrs. Arnold, and from her he doubtless had a good idea of his character. André at first was very unwilling to undertake such risk, but finally yielded to the wishes of Sir Henry Clinton.—It was now necessary for Arnold to act with the greatest caution. He had determined, if possible, to bring André to head-quarters, and accordingly wrote to Col. Sheldon, commanding a troop of horse at Salem, Westchester co., that he expected a person to come out from New York with a flag, and if he did, to meet him at Dobb's Ferry, and thence give him an escort to head-quarters. He wrote André at the same time, who refused to comply with his request, but who, signing as "John Anderson," informed Col. Sheldon that on Sept. 11 he hoped to meet Mr. G. ("Gustavus") at Dobb's Ferry. Sheldon did not exactly understand this letter and sent it to head-quarters, saying that he would be unable to meet the flag, but hoped that Gen. Arnold himself could. Arnold at once replied, explaining André's mysterious letter in the most plausible manner, and adding that as he had business at Verplanck's Point he would continue down to Dobb's Ferry. He did so; but, from some unexplained reason, André and Beverley Robinson, now cognizant of the whole scheme, did not appear, and no meeting took place. While at the ferry he wrote to Washington, who was encamped with the main army at Tappan, meditating an attack on New York, that he came down the river to examine its defences and establish a line of signals. Another meeting was now appointed for Sept. 20, he informing André that he must assume disguise, and would be met by a trusty person on the east side of Dobb's Ferry. Meanwhile Clinton, tired of delay, sent the Vulture sloop-of-war up the Hudson as far as Teller's Point, with Beverley Robinson on board. Robinson, in order to inform Arnold of his presence, wrote him a letter asking an interview, ostensibly in regard to his West Point property, and another of the same purport to Gen. Putnam, pretending to think that he was then in the Highlands. These letters were openly despatched by a flag-boat to Verplanck's

Point, 6 miles above the Vulture's anchorage. That very day, Monday, Sept. 18, when a conference seemed so easy, new troubles sprang up in the path of the traitor. Washington, anxious to meet the count de Rochambeau at Hartford, came up, with his suite, to Verplanck's Point, a few hours after the reception of the letters, which Arnold, with cool audacity, showed to him, he having heard of the commander-in-chief's approach and come down from head-quarters, with a show of respect, to meet him. Washington strongly advised Arnold not to see Robinson, saying that after all of Arnold's troubles a conference with a tory would be likely to injure him in the public estimation. He then, with his suite, of whom Lafayette was one, crossed the river in Arnold's barge, and, looking at the Vulture through his glass, he spoke in low tones to those about him, while Lafayette, in allusion to the interchange of news then common between West Point and New York, said: "You have a correspondence with the enemy, Gen. Arnold, and must find out what has become of Guichen"—Guichen being then looked for with a French squadron. Arnold was greatly confused, and afterward confessed that he thought the treason was discovered. He accompanied Washington as far as Peekskill, and the next day, returning to head-quarters, boldly wrote to Robinson, saying that the commander-in-chief would not permit a conference, and referred him to the civil power. But within this letter were two others, one again to Robinson saying that on the next night he would send a trusty person to Dobb's Ferry, or on board the Vulture, advising, also, that she should remain where she was. The other was a copy of his late one to André. All 8 were at once sent off from the ship to Sir Henry Clinton, who despatched Major André on the morning of the 20th to Dobb's Ferry, when, meeting no one, he pushed on and reached the Vulture at 7 o'clock the same evening. Before leaving New York, Clinton gave him the most positive instructions not to go within the American lines, not to change his dress, and above all not to take any papers. No boat came off to the Vulture as André had expected, and for good reason. Joshua H. Smith, living near the village of Haverstraw, a man of respectable family and of fair outside character, had been employed by Arnold and his predecessor at West Point, Gen. Howe, in gaining intelligence of the enemy. In this instance, Arnold had used him for his own purposes, and made him aware that he expected to hold a conference with a person on important civil business from New York. There is good reason to believe that Smith knew more of the plot than he ever professed to, although much obscurity rests on his share in the transaction. Smith was to go to the Vulture and bring "Mr. Anderson" on shore, but could get no boat, and at once despatched one of his farm hands to head-quarters. Arnold sent the man back with some simple message, and at once went down himself to Verplanck's Point, thence

despatched an officer in his own barge up to the "Continental Village," on a little creek some miles above, to bring down a boat, which he ordered the quartermaster at Stony Point to send into Haverstraw creek, near Smith's house. That night, Sept. 21, 1780, about 11 o'clock, Smith and 2 hands pulled with muffled oars to the Vulture; returning at a late hour with Major André, who, anxious to bring matters to a conclusion, determined to go on shore, in spite of Robinson's remonstrances. He wore his uniform coat, but over it a large blue sur-tout which completely hid his regimentals. He landed at the foot of Clove mountain, 6 miles below Stony Point, and Smith conducting him to Arnold, who was waiting among the bushes, left them alone together. It being near morning when he landed, the plotters had not sufficient time to conclude their conference, and at Arnold's instance André mounted a horse and they rode together to Smith's house. The challenge of a sentinel demanding the countersign, was the first intimation André had that he was within the American lines, and he was much alarmed,—and still more so when he heard a cannonade down the river and saw the Vulture fired upon from below Verplanck's Point, and obliged to drop down stream out of the reach of shot. After breakfast the plotters concluded their plans, and Arnold set off about 10 o'clock and returned to head-quarters; he never saw André more. What his reward was to have been had the scheme succeeded, has never come to light, but it was no doubt immense. The day was fixed for striking the great blow: the British troops were already embarked under the pretence of invading the Chesapeake, and the moment that Arnold knew they were on the move he was to give "an alarm," and draw the troops out of the garrison, and scatter his forces, while the enemy, by routes which had been fully agreed upon, should march at once into the several forts, meeting but little opposition. Now that André was within the American lines he found it necessary to leave off his uniform and assume disguise. Smith intimated his surprise that a person coming on civil business, should wear the dress of a British officer, and Arnold readily quieted his suspicions by informing him that "Mr. Anderson" was a man of such vanity, that he always wished to make a display, and in order to do so on this occasion had borrowed a coat of a military friend. Before parting from André he gave him a passport worded thus: "Head-quarters, Robinson's house, Sept. 22, 1780. Permit Mr. John Anderson to pass the guards to the White Plains, or below if he chooses, he being on public business by my direction. B. Arnold, M. Gen." He also gave him 6 other papers: 1. "Artillery orders, which had recently been published at West Point, giving directions how each corps should dispose of itself in case of an alarm;" this paper was of the utmost consequence, as it enabled an enemy to know the precise position of the garrison. 2.

"An estimate of the forces at West Point and its dependencies." 3. "An estimate of the number of men requisite to man the works." 4. "A return of the ordnance in the different forts, redoubts, and batteries." 5. "Remarks on the works at West Point, describing the condition of each, and its strength or weakness." 6. "A report of a council of war lately held at head-quarters, at Tappan," which Washington had sent to Arnold only a few days before, requesting his opinion on the subjects to which it referred. Thus almost in spite of himself André had violated the positive instructions of Sir Henry Clinton. He was captured the next day at Tarrytown, and delivered to Col. Jameson, at North Castle. With unaccountable stupidity, Jameson at once decided to send his prisoner to Arnold, writing him at the same time that papers of a dangerous tendency had been found upon him, which he had forwarded to Washington, at Hartford. Major Tallmadge, next in command to Jameson, returning to North Castle in the evening from duty near White Plains, was astonished at his superior officer's blindness, and induced him to order André back, although Jameson would insist on his letter to Arnold going on. That same day Washington returning from Hartford to Robinson's house, met the French minister, M. de Luzerne, at Fishkill, the minister being on his way to Newport. He induced Washington to stop for the night, and the next morning on nearing Arnold's head-quarters, the commander-in-chief sent forward 2 aids to say that he would soon arrive, but must ride down by the river's bank with Generals Knox and La Fayette, to examine some redoubts. General, and Mrs. Arnold, who with her infant child had come from Philadelphia but 10 days before, in company with the aids sat down to breakfast. A messenger came in express bearing Jameson's letter announcing the capture of "Anderson." Startled, but with wonderful presence of mind, Arnold told the aids that he was suddenly called over to West Point, and would soon return to meet Washington. Then summoning his wife to her chamber he said that they must instantly part, perhaps never to meet again, for he must flee at once to the enemy. She swooned upon the floor, and he left her in convulsions. He hurried to the door, mounted the messenger's horse, dashed to the river's bank, and finding his 6-oared barge in waiting, ordered the men at once to row down the river with all their strength, and he would reward them well. They bent to their oars, and as they pulled through King's ferry, Arnold showed a white handkerchief, which at Verplanck's Point caused the boat to be mistaken for a flag. He reached the Vulture in safety, and to complete his iniquity turned on the boatmen and "rewarded" them by saying that they were prisoners of war. As soon as Sir Henry Clinton heard of this meanness, he set them all at liberty.—A few hours after his escape he wrote to Washington, chiefly in regard to Mrs. Arnold; but, alluding to his

desertion, he spoke of the attachment he still held for his country, and of "a heart conscious of its own rectitude." Meanwhile Washington suspecting nothing, came to the house after Arnold's flight, breakfasted hastily, and went over to West Point to meet him. No preparations for a salute were visible, and he was much surprised to learn that Arnold was not there. He returned, after examining the various defences, about 4 o'clock, P. M., and was met by Col. Alexander Hamilton, who was anxiously awaiting him, Mrs. Arnold being frantic with grief and terror. The despatches from Jameson had been faithfully cared for, and the messenger learning on the road that he had left Hartford, turned back and came direct to Robinson's house. He said the papers he bore were of the utmost consequence, and Hamilton opened the packet. The whole plot was revealed, but too late to prevent the escape of the traitor, through the stupidity of Lieut. Col. Jameson.—The subsequent career of Arnold may be told in a few words. He joined the British army and took part in an expedition against Virginia, and afterward against New London, in Connecticut. In the latter instance he is said to have witnessed, from a church steeple, the burning of New London, with fiendish cruelty watching this destruction almost in sight of his native home. After the surrender of Cornwallis, at Yorktown, he went to England, but was only partially rewarded for his treachery by the payment of £6,800. His position was humiliating, for nearly every one avoided him with disgust and horror, and he was repeatedly insulted. At one time he engaged in business at St. John's, New Brunswick, and at Point Pitre, Gaudeloupe, but returned to England where he sunk into utter obscurity. His wife died in London, in 1796. He left several children. For a full account of Arnold's treason see Sparks's "American Biography," and Washington Irving's "Life of Washington."—JAMES ROBERTSON, 2d son of the preceding, born in the United States in 1780, the same year in which his father disgraced himself by betraying his country, died in London, Dec. 27, 1854. In 1798 he entered the British army as 2d lieutenant, and, after having taken an active part in the blockade of Malta and the Egyptian campaign, he was gradually promoted to the rank of lieutenant-colonel. Subsequently he served in the West Indies, Bermuda, and North America. While engaged in the attack of Surinam he displayed great courage, and was severely wounded, on which occasion he was presented with a valuable sword by the patriotic fund. After his return to England he was for some time attached to William IV. as aide-de-camp. He was promoted to the rank of colonel in 1837, of major-general in 1841, and of lieutenant-general in 1861.

ARNOLD of BRESCIA, one of the most noted of reformers before the Protestant reformation. The year of his birth, early in the 12th century, the names and rank of his parents, are

all unknown. He first appears in history as a scholar of the French rationalist Abelard, and from the first was distinguished among his fellows by a finished and most persuasive eloquence. Returning after a time to Italy, the land of his nativity, he found scope for his peculiar gift in contending with the wide corruption which prevailed in all parts of the ecclesiastical administration. He attacked with vigor the luxury, the venality, the indifference to religious duties, and the degrading worldliness of the clergy against which the authorities of the church presented no effectual resistance. The special doctrine which he maintained was the antagonism of the church to the world. He held that the same man ought not to hold secular and religious office, or to take care at the same time of property and of souls. This doctrine (which was only the application of the ground principle of the monastic life to the general affairs of the church), urged by the wit, the vehemence, and the persuasive voice of so devoted an advocate, speedily made for him a party, which was joined by men of influence as well as by the masses. Disturbances broke out, the clergy protested, the bishop of Brescia became alarmed, a complaint was sent to Rome, and at the council of the Lateran in 1139, Arnold was condemned as a disturber of the peace, forbidden to preach, and banished from Italy. His party, however, was not annihilated, nor his influence destroyed. In France, where he went to visit Abelard, whose name had been joined with his in the sentence of condemnation, and in Switzerland, where he preached for some years, he gained many adherents. Meanwhile, a bold application of his principles had been attempted in Rome itself. The demands of the papal see excited a republican movement, and a secular president was appointed to govern the state, while the pope was restricted to the exercise of spiritual authority. This change in the national government being negated in the sacred chamber, a revolt broke out, and the pope was forced to leave the city. Summoned back by a call which he could not disobey, Arnold assumed the direction of the movement, and for a time his influence seemed likely to restore to the Romans their ancient freedom in connection with order. But the license of rioters hindered his plans, reaction came, one by one his reforms were nullified, and the unfortunate murder of a cardinal in the street enabled the English pope Adrian to turn against this alleged disturber of the peace, and enemy of the church, the sympathies of the fickle populace. Arnold and his friends were driven ignominiously from the city in which they had so strenuously labored. Some of them returned to Tuscany, where they celebrated the virtues and the heroism of the suffering "prophet." Arnold himself sought refuge with some noblemen of the country, but the demand of the pope for his surrender, enforced by the threatening of the emperor Barbarossa, frightened his protectors

into compliance, and Arnold was sent to execution. He was hanged, or, as some say, crucified on the Piazza del Popolo, his corpse was burned, and his ashes thrown into the Tiber, to hinder, as the historian Otto of Freisingen remarks, "the stupid people from worshipping his relics." This event took place in the year 1155.—Arnold's importance in history consists in the fact that he was the first to proclaim and organize a revolt against that claim of Rome which Hildebrand had secured to the church. He was not a heretic in doctrine, nor had he any share in the philosophical and scholastic revolution inaugurated by his master Abelard. He was rather what Baronius calls him, "the patriarch of political heretics." His private life was above reproach, and his enemies regretted that so good a man should do so bad a work, that a practice so pure should accompany a doctrine so pernicious. His charm of person was such as to win to him men of differing opinions, and fit him eminently to be leader of a party. His strength and his weakness were both found in the single idea which he seemed to represent, and the single cause to which he gave himself, the separation of church and state. His doctrine was, however, in advance of his age, and could find its full expression and power only after many centuries.

ARNOLD, CHRISTOPH, a German astronomer, born at Sommerfeld, near Leipsic, Dec. 17, 1650, died April 15, 1695. He was a simple farmer, who devoted his hours of leisure to the observation of the stars. He erected an observatory at his own house, and entered into correspondence with the most learned savants of his time. He was the first to call the attention of the astronomers of Leipsic to the comets of 1688 and '86. He also acquired great fame by his observation of the passage of Mercury across the sun's disk, Oct. 31, 1690. The town council of Leipsic gave him a present of money and exempted him from all city taxation for life. The astronomer Schröter has bestowed the name of Arnold on 8 valleys in the moon.

ARNOLD, GEORG DANIEL, a writer in the Alsatian dialect, born at Strasbourg, Feb. 18, 1780, and died 1829. In 1806 Arnold was made professor of civil law at Coblenz. His *Pfingst-montag* (Whit-Monday) is a comedy in the Alsatian dialect. Goethe, in his *Kunst und Alterthum*, speaks in high terms of its truthfulness and artistic power.

ARNOLD, GOTTFRIED, a Lutheran theologian, and historiographer of king Frederic I. of Prussia, born at Annaberg in Saxony Sept. 5, 1665, and died of fright on seeing Prussian recruiting officers enter his church while he was preaching, May 20, 1714.

ARNOLD, JOHANN, a Prussian miller, whose name acquired some importance in Prussia, from its connection with a law case, which gave an opportunity to Frederic II. to display a certain despotic sense of justice. Arnold had to pay an annual rent for the land and water which he

required to carry on his business, when the owner laid out a new pond which absorbed all the water, and the supplies for the mill were cut off. Yet when the rent day came, not the least allowance was made by the landlord. He insisted upon the money, and as the miller had not got it, the mill was seized, and the poor fellow who had a large family was left to starve. The miller brought his case before the king, who put it into the hands of one of his superior officers, and on a decision in favor of the landlord the king ordered the arrest of all the judicial parties connected with the case. However, when the matter was brought before the highest court of appeal, the judgment of the lower court was confirmed, and the judgment passed by the officer of the king became invalid. But the king took no notice of the decision of the courts. The 6 magistrates who had pronounced in favor of the landlord were dismissed, held in durance for a year, and in conjunction with the landlord were condemned to pay damages to the miller. The governor of the district, under whose eyes the case was allowed to pass, was also dismissed. Public sympathy was excited in behalf of the magistrates, and after Frederic's death they were reinstated in their position.

ARNOLD, JOHN, the inventor of the expansion balance, and of other improvements in the mechanism of chronometers, born in Cornwall, England, in 1744, died Aug. 25, 1799. At first an itinerant repairer of clocks, his talent at length recommended him to the notice and patronage of George III., and after a series of experiments he succeeded in making such superior chronometers, that those of his manufacture were commonly selected by the East India company. They were so accurate, that the board of longitude allowed him several premiums for them.

ARNOLD, LEMUEL H., governor of Rhode Island in 1831 and 1832, born at St. Johnsbury, Vt., Jan. 29, 1792, died at Kingston, R. I., June 27, 1852. He graduated at Dartmouth college in 1811, studied law with James Burrill, and after practising his profession for a time, engaged in manufacturing. After holding the office of governor, he sat as a representative in congress, from 1845 to 1847. His father was a member of the continental congress.

ARNOLD, MATTHEW, son of Thomas Arnold, born Dec. 24, 1822, at Laleham. He was educated at Winchester, Rugby, and Oxford; won the Newdigate prize for English verse by a poem entitled *Cromwell*; in 1845 was chosen fellow of Oriel college; from 1847-'51 was private secretary to Lord Lansdowne. Having married, Mr. Arnold received an appointment as one of the lay inspectors of schools under the committee of the council of education. In 1849 he published, anonymously, a small volume of poems under the title "The Strayed Reveller and other Poems." In 1852 a second volume appeared, "Empedocles on *Ætna*, and other Poems." In 1853 a new volume was issued in his own name, followed by a second series, the

two containing such poems in the previous collections as the author wished the public to preserve, along with some fresh pieces. The introduction to the American edition (Boston, 1856), sets forth Mr. Arnold's theory of the poetic art, the peculiarity of which is expressed in a brief extract: "In the sincere endeavor to learn and practise, amid the bewildering confusion of our times, what is sound and true in poetical art, I seemed to myself to find the only sure guidance, the only solid footing among the ancients." Following this principle, the poet carefully selects a theme that is removed by distance from the passing of the present time, and treats it in a calm and elevated style, deeply thoughtful, reflective, and highly finished, not wanting in subdued and tender feeling, but distinguished more for intellectual ripeness and richness, purity of tone, and severity of taste. His cast of mind is contemplative, and he is a thorough scholar in classic and romantic lore. But the descriptive passages in his volume indicate a genial sympathy with nature, and a delicacy of handling that is very rare. On May 5, 1857, Mr. Arnold was elected professor of poetry, at the university of Oxford, in the room of the Rev. Thomas Legh Claughton, whose term of office had expired. He was opposed by the Rev. John Ernest Bode, also a distinguished member of the university, and, after an unusually spirited contest, was elected by a considerable majority. The office, held for 10 years, is one of greater honor than emolument.

ARNOLD, DR. SAMUEL, an English writer of music, born in London in 1739, died Oct. 22, 1802. At the age of 21 he became composer to Covent Garden theatre, a post which he held, with occasional intervals, during the greater part of his life. He published no less than 47 operas, of which "The Maid of the Mill" was for many years a favorite on the stage. "The Prodigal Son," an oratorio, also had remarkable success. About the year 1786 he produced 4 volumes of cathedral music, which have always been held in high esteem, and are still a standard work. His published works, beside those enumerated, were very numerous.

ARNOLD, THOMAS, D. D., born at Cowes, Isle of Wight, June 13, 1795, died at Rugby, June 12, 1842. His father, William Arnold, was collector of customs at that place. No incidents tender his life remarkable. It was the life of a studious, thoughtful, earnest, and Christian man. When 8 years old he was sent to Warminster, and at 12 to Winchester college, where he was known as an indolent, shy, and restless boy. In 1811, having obtained a scholarship at Corpus Christi, he removed to Oxford. Here he showed a fondness for history and poetry, and gave much time to the study of ancient historians and philosophers, especially of Aristotle and Thucydides. At this period of his life he was addicted to discussion. He was eager in argument, fearless in taking and firm in defending his positions, with liberal tendencies,

and strong convictions, but withal very generous, high-toned, and affectionate. In 1814 he took a first class degree, and the year after was elected fellow of Oriel college. In 1815 and 1817 he was chancellor's prizeman for the Latin and English essays. His mind had been troubled with religious doubts, but these were completely overcome, and in 1818 he was ordained deacon, in 1828 priest, and assumed the office of chaplain at Rugby school. In 1820 he married Mary, the youngest daughter of Rev. J. Penrose, rector of Fledborough, Nottinghamshire, and resided at Laleham, near Staines, where he had settled the year before, and employed himself in the preparation of young men for the universities. In this quiet retreat, under the influence of domestic ties, and the cares of a responsible office, his character underwent a decided change. His views of life became fixed and serious, his purposes earnest, his aims decisive and lofty. From this point his career seems to have fairly commenced. So well known was he, that on his application for the post of head master of Rugby school, he was elected, though others had applied before him, the trustees being assured that "he would change the face of education all through the public schools of England." He entered upon the duties of this office in August, 1828, and devoted to it all his powers of mind and character with an effect that more than satisfied the expectations of his friends. His peculiar gifts as an instructor, and the singular force of his personal qualities, raised the Rugby school to a position of great eminence, and elevated the intellectual and moral standard of similar institutions in other parts of England. Dr. Arnold enlarged the basis of education at Rugby by adding to the classics other departments of learning; but his influence was chiefly felt in the practical bearing upon life and character which he gave to all education, and in the lofty Christian spirit which he endeavored to impart to his scholars. For the sake of moral government, he substituted for the old system of flogging, a responsible supervision of the younger lads by the boys in the highest class—a plan that was criticized in some quarters, but which he defended in the "Journal of Education," 1834-'5. Fourteen years, the last years of his life, Dr. Arnold spent in this congenial occupation, dignifying the office of teacher, and, arduous as his duties were, finding leisure to bestow his attention upon other matters of private and public interest. His literary labors were not suspended. Into the political and religious questions of the day he entered with zeal. He was a strenuous opponent of the new school at Oxford. He took part in the debate upon church and state, wrote a pamphlet in 1838, upon "Church Reform," and later, "Fragments upon the Church," in which he contended earnestly against the advocates of the state church theory, opposed the legal establishment of a sectarian religion, and urged that church and state, instead of being formal-

ly united as two separate interests, should rather be identified, the state being in fact the working church, applying through its laws and institutions the principles of a vital Christianity to the world of human life. This idea of the essential harmony, and the necessary coöperation of man's spiritual, moral, intellectual, and practical powers, was a favorite one with Dr. Arnold—a thought which influenced his private career, was effective in making the Rugby school what it became, and left its mark upon his broader speculations. He wished to make religion a life, and life a religion. In 1835 he accepted a fellowship in the senate of the new London university; and having convinced himself that an acquaintance with the Scriptures was indispensable to the students; and that an examination in the New Testament might be prescribed without injury to the broad Christian character of the university, he proposed and carried a resolution: "That, as a general rule, the candidates for the degree of bachelor of arts shall pass an examination, either in one of the 4 Gospels, or the Acts of the Apostles, in the original Greek, and also in Scripture history." When at a larger meeting, in Feb. 1838, the senate of the university of London rescinded this resolution, and substituted for it the resolve: "That an examination in the text of the Old and New Testaments be instituted, but at the same time be made voluntary with the candidates." Dr. Arnold, not considering such voluntary examination satisfactory, withdrew from the senate of the university.—For several years he had been also much interested in the condition of the working classes; he delivered lectures before the Rugby Mechanics' institute, started a periodical in 1831 called the "Englishman's Register," of which only a few numbers were published, and wrote letters for the "Sheffield Courant," and the "Herts Reformer." Dr. Arnold declined accepting any political preferment from the whigs, with whom his views were mainly in sympathy. He loved academic life. And when Lord Melbourne appointed him to the Regius professorship of modern history at Oxford, he welcomed it as the post of all others for himself. But a single year was all that was allowed him in it. He gave his inaugural address, and a course of introductory lectures, and was laying out plans for wide usefulness, when he was seized with a violent spasm at the heart, and died in the 47th year of his age. His great work, the "History of Rome," in 3 vols., carried the narrative to the end of the second Punic war; a fourth volume embraced his contributions to the "Encyclopædia Metropolitana," extending the history to the time of Trajan. We have from him beside, an edition of Thucydides with notes, a course of lectures on modern history, 5 volumes of sermons, a volume of miscellaneous writings, and 2 volumes of very interesting correspondence, edited by Rev. A. P. Stanley, who published with them a memoir of Dr. Arnold.

ARNOLD, THOMAS KEBORNE, a clergyman of the English church, and author of several series of text-books for schools, born in 1800, died March 9, 1853. He was educated at Trinity college, Cambridge, and in 1838 published the first of a numerous list of introductory books for the study of the Greek, Latin, Hebrew, German, French, and Italian languages. These works were extensively used in the schools of England, and have been republished in America, and generally introduced into American schools. He next prepared a series of school classics, combining portions of the best Greek and Latin authors; and the full classical series of Mr. Arnold covers the entire ground from first lessons to accomplished scholarship. In addition to these labors, he was an occasional writer on religious and ecclesiastical questions, and published a volume of sermons. He died suddenly of bronchitis.

ARNOLD, W. D., a son of Thomas and a brother of Matthew Arnold. He is an officer in the British army, and has written a novel of much promise, called "Oakfield, or Fellowship in the East." Its aim is to represent the trials of a young officer who is determined to act up to Christian principles in a British regiment stationed in India. The work is auto-biographical, in the same indirect way with Dickens's "David Copperfield" and Byron's "Ohilde Harold."

ARNOLDI, WILHELM, bishop of Treves, born in 1798; in 1844 produced a great commotion in Germany by reviving the obsolete pilgrimage in connection with the holy coat of Treves. One million and a half of German Catholics made the pilgrimage in obedience to his call, and the scenes of tumult and excitement which the ancient city of Treves presented on this occasion, baffle description. The indignation felt by the Protestants was shared by some of the Catholics. Ronge, a liberal Catholic priest, expressed these sentiments in a bold letter addressed to the bishop and published in the *Sächsischen Vaterlandsblätter*. The excitement which followed in the religious world was even greater than that which prevailed in the streets of Treves. Ronge's letter fell like a bomb-shell into the camp of the bishop, and eventually led to the secession of Ronge's German Catholic party from the Roman church.

ARNOTT, ARCHIBALD, physician, born in 1771, died at Kirkconnell Hall, in Scotland, his patrimonial property, July 6, 1855. He entered the army, on the medical staff, and served in Egypt, Italy, Spain, Portugal, Holland, St. Helena, and India,—for the greater part of the time as surgeon of the 20th foot. That regiment was in St. Helena while Napoleon Bonaparte resided there, and, in August, 1819, when the illustrious exile required medical aid, Dr. Arnott made an offer of his professional services, which Bonaparte then refused to accept. In April, 1821—5 weeks before the closing scene—he was admitted, and appears to have speedily

won his patient's confidence and regard by kindness, tact, delicate attentions, and medical skill. When Napoleon was dying, he desired that one of his gold snuff-boxes (the other he bequeathed to Lady Holland) should be brought to him, and, having with his weak hand scratched the initial "N" upon the lid with a penknife, begged Dr. Arnott to accept it in acknowledgment of his kind services. He also bequeathed him 600 napoleons, to which the British government added £500. Napoleon died, his right hand in that of Dr. Arnott. In 1822 appeared an interesting "Account of the Last Illness, Disease, and Post-mortem Appearance of Napoleon Bonaparte," from Dr. Arnott's pen. His memory was stored with anecdotes and traits of Napoleon, which he readily poured out in conversation. His opinion of Sir Hudson Lowe, thus expressed, was very unfavorable. In 1826 he retired from active service, returning to his native place, where his impartiality as a magistrate and his kindness as a landlord combined to make him popular and beloved.

ARNOTT, NERL, a Scotch physician and popular writer upon science, born near Montrose, on the east coast of Scotland, in 1788. He was sent in 1797 to the grammar school at Aberdeen, where he took the first prize at the annual examination, and was a successful competitor for a scholarship. Lord Byron was his schoolmate at Aberdeen. In 1801 he went to the university, and, having selected the medical profession, devoted himself particularly to the study of natural philosophy. He completed his medical education in London, and through the influence of his instructor, Sir Everard Home, was appointed to the post of surgeon in the naval service of the East India company. The position gave him opportunity for scientific observations in different parts of the world, and he derived from it many of the striking facts with which he illustrated his later works. In 1811 he became a medical practitioner in London, but continued his scientific investigations. He was associated with the most learned strangers who visited London, and in 1815 was made physician to the French and Spanish embassies there. He published in 1827 his "Elements of Physics, or Natural Philosophy, General and Medical, explained in plain or non-technical Language." This contained the substance of lectures which he had previously delivered, and was a most successful attempt to illustrate scientific principles in the language of common life. It was republished in different languages, and passed through 5 editions in England within 6 years. The work contained the result of his studies and practice, and was effectually designed, by revealing the laws of life and explaining according to these laws the newest physical inventions and appliances, to add to the health and convenience of men. In 1835 Dr. Arnott was appointed one of the senators of the university of London; in 1837 one of the physicians extraordinary to the

queen, and in 1888 a fellow of the royal society. He published at the same time his "Essay on Warming and Ventilating," in which he showed how much the public health depends upon the right management of the great physical influences, heat and a pure air, and described some prevalent abuses. He continued his researches and publications, and has been the author of numerous contrivances for health and comfort, such as the stove and ventilator to which his name is given, and the water-bed or floating mattress which has often been used with the happiest results. In 1854 he was requested by the president of the general board of health to become one of his council, and received from the royal society their Rumford medal; and in 1855 the jurors of the universal exhibition at Paris awarded him a gold medal, to which the emperor added the cross of the legion of honor. He has since retired from active practice, and is preparing for the press a new and enlarged edition of the "Elements of Physics."

ARNOULT, MADELINE SOPHIE, a French actress of the last century, was born at Paris, Feb. 14, 1744, in the apartment in which Admiral Coligni had been murdered, more than a century and a half before, and died in 1802. The tragic associations connected with her birthplace seem, however, to have had no influence upon her career, which was brilliant and successful. Her father, an innkeeper, gave her a good education, in addition to which she possessed a charming face and figure, a voice of great flexibility and compass, a warm heart, and an unusual share of wit. Accident alone led to her adoption of a profession for which she was not educated, and the publicity attending which was at first exceedingly distasteful to her parents. Some ladies attached to the court of Louis XV. having heard her sing at evening mass during Passion week, were so struck by her fine voice that they induced the royal chapel master to employ her in the choir. Here she was not long in attracting the attention of Madame de Pompadour, who exclaimed at once that she had the talents to make a princess. Her debut upon the stage at the early age of 18 soon followed, and for 21 years, between 1757 and 1778, she was the reigning favorite at the French opera, taking the chief parts in the works of Rameau, Gluck, and the other prominent composers of the day. Her beauty, vivacity, and generosity, rendered her not less attractive than her voice and fine dramatic powers; and such men as Diderot, D'Alembert, Helvetius, Mably, Ducloux, and Rousseau, sought her society. The most eminent poets celebrated her charms in verse, and, in the exaggerated language of the time, she was compared to Ninon de l'Enclos, to Aspasia, and almost every other beauty of ancient or modern renown. Notwithstanding the severity of her wit, which was frequently exercised, she made no enemies, and exacted from her contemporaries a willing admission of her lyric and dramatic supremacy. Her *bons mots*, of which many

have been collected, are brilliant and pointed, and her tendency to indulge in them, regardless of place or occasion, is forcibly illustrated in her last moments, when she exclaimed to the priest in attendance, *Je suis comme Sainte Madeleine; il me sera beaucoup pardonné, parce que j'ai beaucoup aimé*. At the commencement of the revolution she retired to a country house at Luzarches, which had formerly been a parsonage, and over the door of which she inscribed the words, *Its missa est*, where she seems to have passed the rest of her days. One of her sons, a colonel of cuirassiers, was killed at the battle of Wagram.

ARNSBERG, or ARENBERG, a town of Prussia, duchy of Westphalia, capital of an administrative division of the same name, and once the capital of the whole duchy of Westphalia. It is situated on a hill partly encircled by the Rhine. It is divided into the old and new town, and has a flourishing agricultural school and gymnasium. In the middle ages it was one of the principal seats of the Vehmle court, which exercised a powerful influence throughout Germany. Pop. 4,000. The province, the division of Arnsberg, has an area of 2,260 square miles. It was transferred to Prussia from Hesse-Darmstadt in 1813. Pop. 462,082.

ARNULPH, bishop of Rochester in the reign of Henry I., was a native of France, born 1040, died in March, 1124. He left the French monastery where he lived on account of the immorality of his companions, and came to England, where he was successively prior of the monastery of Canterbury, abbot of Peterborough, and bishop of Rochester. He wrote, in Latin, a history of the church of Rochester.

AROLSEN, a town of West Germany, capital of the principality of Waldeck, on the Aar. Population, 2,050. It has a fine castle, the residence of the reigning prince, with a large library and valuable paintings, and several manufactures of woollen goods.

AROMA (Gr. *ἄρωμα*, pleasant perfume), the principle in plants or other substances which constitutes their fragrance. In some plants this resides in a volatile oil, but in others the portion containing this principle cannot be detected. It is of an extremely subtle nature, filling the air of rooms, or even the whole atmosphere around gardens; and though constantly imparted, as it may be, for instance, in the case of musk, for years, so as constantly to fill the air of a well-ventilated room, yet never causing to the substance from which it comes any diminution of weight. The aroma of plants is imparted to oils by maceration, but not to water.

AROMATARI, GIUSEPPE, an Italian physician, born at Assisi, in the duchy of Spoleta, in 1586, died in 1660, practised his profession for 50 years in Venice, and achieved such a reputation, that James II. of England, the duke of Mantua, and Pope Urban VIII., made him the most tempting offers to enter their service, which he however declined, as he preferred his

independence at Venice. Beside some essays on medical subjects, he wrote an interesting paper on the character of Petrarch, his favorite poet. One of his most important works is his letter to Bartolomeo Nanti, *De Generatione plantarum ex seminibus*. Its leading ideas on the analogy between the seeds of plants and the eggs of animals, were fully adopted and developed by Harvey.

AROMATICOS. These are substances—plants, drugs, or medicines—which emit agreeable odors, and are usually characterized by a warm pungent taste. Such are the spices: cinnamon, ginger, pepper, balsams, frankincense, &c. They generally contain a peculiar volatile oil, mixed with resinous substances. The animal kingdom furnishes some aromatics, as ambergris, musk, civets, and castor. Aromatics are employed in the manufacture of perfumery, as condiments, and as exciting or antispasmodic remedies in medicine.

AROOAT, or EL AROOAT, capital of a state of the same name in the Sahara, North Africa, 300 miles from the sea-coast, lat. 33° 48' N. long. 1° 38' E. It is built on the sides of a hill, at the base of which flows the Wady-Mzi, and is surrounded by a rude mud and stone wall.

AROOSTOOK, a county constituting the N. E. extremity of Maine. Area, 4,960 square miles. Population, 12,529. Organized in 1889. Capital, Houlton. The surface is undulating, with occasionally a mountain peak, the loftiest of which are Chase's Mount and Mars Hill. Where it has been tilled the soil is good, but the greater part of the country is still clothed with the primeval forest. The St. John's river, which forms its northern boundary, is navigable for vessels of 50 tons burden. It is also watered by the Aroostook, and a number of smaller rivers. In 1850 this county produced 10,675 bushels of wheat, 201,687 of oats, 191,541 of potatoes, 17,814 tons of hay, and 186,691 lbs. of butter. There were 18 lumber establishments, 5 grist mills, 8 saw and planing mills, 13 shingle mills, and 2 tanneries. It contained in that year 8 churches, 2,021 pupils attending public schools, and 129 attending academies or other schools.

ARPAD, the Magyar national hero, son of Almos who led the Magyars into Hungary, flourished in the latter part of the 9th century, died in 907. He continued the work of his father, conquered Transylvania, Croatia, and Slavonia, and kept up wars, especially with the Bulgarians and Moravians, occasionally seizing a piece of territory on every hand, and supporting the expenses of his government by predatory excursions against Italy and the Slavonic tribes on the west. He was finally defeated by the Moravians in 906, on his return from a plundering expedition in Saxony. His history is preserved in the popular songs and traditions of his people, combined naturally with much that is fabulous. His dynasty ended with Andreas III., in 1301.

ARPEGGIO, a musical term, literally signi-

fyng harp-like, in the manner of a harp, used to denote the striking of the notes of a chord in repeated succession, in imitation of the harp.

ARPENT, the old French name for acre, still used by the French of Lower Canada. At the present day land is measured in France by ares or hectares.

ARPINO, GIUSEPPE CESARI D', an Italian painter, born at the castle of Arpino, in the kingdom of Naples, in 1560, of obscure parents, died at Rome in 1640. While employed in a menial capacity by some artists who were at work in the Vatican, he accidentally discovered such an aptitude for drawing figures, that he attracted the attention of Pope Gregory XIII. He was placed with good masters, and eventually became a successful painter. His pictures show great facility and invention, correct drawing, and an apparent grandeur of style, but are at the same time artificial, and lack the simplicity and dignity of the old masters. He enjoyed the patronage of Pope Clement VIII., the successor of Gregory XIII., and founded a very successful academy at Rome. His character was disfigured by selfish traits and envy of his brother artists, whose works he studiously depreciated.

ARQUA, or ARQUATO, a village of northern Italy, 12 miles S. W. of Padua. It is famous as the place of the house and tomb of Petrarch. He died here at his villa in July, 1374, and was laid in a sarcophagus of red marble, raised on 4 pilasters, on an elevated base.

ARQUEBUSE, sometimes, but incorrectly, written *harquebuse*, from the French *arquebuse*, and corrupted in English, particularly on the Scottish borders, into *hagbut*, or *hackbut*—the earliest form of the musket, which became really serviceable in the field for military purposes. So long ago as the battle of Bosworth, A. D. 1485, it was introduced under the name of a hand-gun, which was nothing more than a short iron cylinder closed with a *quasi*-breach at one end, and provided with a touch-hole, fastened to the end of a stout wooden pole, like the handle of a spear or halberd. This hand-gun or miniature cannon was loaded with slugs or small bullets upon a charge of coarse powder, and was discharged by means of a match applied to the vent, the instrument being supported on the shoulder of the front rank man, who was a pikeman or halberdier, and directed by means of the handle, and fired, though of course without any aim, by the rear rank. Even earlier than this, at the battle of Agincourt, according to Hall's chronicle, the Britons were armed "with fiery hand-guns." So clumsy, however, and slow of operation were these antique firearms, that, in spite of their formidable sound and unaccustomed appearance, they produced little or no effect. In the reign of Henry VIII., although during its earlier years, the battle of Pavia was won by the fire of the Spanish arquebusiers, the longbow still held its own as the superior weapon, in virtue of its accuracy of aim, its range, and penetration;

and even in the reign of Elizabeth, the longbow is spoken of as "the queen of weapons," although she had musketeers in her army, and assisted Henry IV., of France, with a body of horse arquebusiers, commanded by Col. James, an ancestor of the well-known novelist. During her reign, this arm was greatly improved, although it was still so long and cumbersome that it could only be fired from a forked rest planted in the earth before the marksman, that indispensable instrument being sometimes furnished with a pike or halberd-head, so as, when set obliquely in the ground, to serve as a palisade. The barrels of these old pieces are extremely long, of very thick metal, usually small-bored, and sometimes, already, rifled; as is the case with the piece still preserved at Hamilton palace, in Scotland, with which the regent Murray was shot by Hamilton of Bothwellhaugh, in the year 1570. They were fired by means of a coil of match, or wick, of prepared hemp, passed through a hammer, like that of a modern firelock, which, being released by the pulling of the trigger, threw down the lighted match into the pan, and discharged the piece. In due time the matchlock gave way to the wheel-lock, in which the flint was fixed so as to be stationary, over the pan, and a toothed wheel, by means of a spring, was set in rapid motion against its edge, so as to project a shower of sparks into the powder below. To the wheel-lock succeeded the snapshance, as it was called. This was the first uncouth rudiment of the flint and steel lock, which was brought to such perfection by Joseph Manton, and which has only, within a few years, been entirely superseded by the percussion cap, than which it is not easy to imagine a quicker and more infallible instrument of ignition. The snapshance came into use for fine pistols, fowling-pieces, and choice musketoons, during the English civil wars; but their rarity and high price kept them out of general use, except as the arms of gentlemen and officers of rank, while the matchlock still continued the weapon of the rank and file. It is remarkable that there has been far less advancement than one would have imagined, from the first invention of the improved arquebuse until very recent days, in the mere workmanship of the barrel and the accurate flight of the ball. The difficulty of aiming truly seems to have arisen solely from the defective method of firing, the clumsiness of the piece, and the extreme slowness of the ignition; for many arquebuse barrels of great antiquity, especially those of Spanish manufacture, having been altered to the percussion principle, new-stocked, and properly balanced, are found to shoot with great accuracy and even unusual penetration, at long ranges.

ARRACK, or RACK, a spirituous liquor distilled from fermented rice, and also from the sap of the cocoa palm. The word is of oriental origin, and no doubt used as a generic term for all distilled liquors, as there are arracks of grapes, berries, and even of wild flowers in va-

rious parts of the East. The arrack of commerce is, however, only that distilled from rice, and comes, usually, by way of Holland, from Batavia in the island of Java. When new, it has a strong, oily taste, but when mellowed by age becomes peculiarly rich and agreeable in flavor, and is highly prized as an ingredient in the composition of punch, for which only it is used.

ARRAH, a town in Hindostan, capital of the district of Shahabad, presidency of Bengal, on the route from Dinapore to Ghazepore, 25 miles west of the former, 75 miles east of the latter. It was attacked in July, 1857, during the insurrection which then convulsed the British possessions in India, by a body of mutineers from Dinapore, who massacred the European population, without sparing one of the 50 women, men, and children, of whom it was composed. One of the 2 steamers which had been despatched for the relief of the unfortunate town grounded, and the 200 European troops that had been landed from the other steamer fell into an ambush where 9 officers and upward of 100 men were killed.

ARRAIGN, ARRAIGNMENT. Sir Matthew Hale derives these words from the Norman French *ad-reasoner*, modern *arraisonner*, to call to account. They are now used in criminal law practice to denote the act of calling the defendant to the bar of the court to answer the accusation contained in the indictment. Arraignment consists of 8 parts: 1. Calling the defendant to the bar by his name, and commanding him to hold up his right hand; this is done to identify the prisoner from a number of other prisoners who may be at the bar. 2. The reading of the indictment, to let the accused know what he is to be tried for; the clerk of the court, after saying, "A. B., hold up your hand," proceeds, "You stand indicted by the name of A. B., late of &c., for that you, on &c.," and so on to the end of the indictment. 3. After the reading of the indictment is concluded, the clerk adds, "How say you, A. B., are you guilty, or not guilty?" If the answer be "Guilty," the confession is recorded, and the matter lies over for judgment; if "Not Guilty," that plea is entered, and the clerk or the attorney-general quietly replies, "He is guilty." Upon this contradiction the issue is made up, and the trial proceeds.

ARRAN. I. NORTH ISLAND, the largest of the group of islands called the Rassey, lying off the N. W. coast of Ireland. II. SOUTH ISLANDS, a group of small islands at the mouth of Galway bay, west coast of Ireland. III. A mountainous island in the Frith of Clyde, Scotland, 20 miles long and 10 wide. Its highest summit, Goatfell, is 2,000 feet above the sea.

ARRAN, EARL OF, head of the noble family of Hamilton, in Scotland, created dukes of Chatelherant by Henry II. of France. The earldom of Arran was originally in the family of Boyd; the earl Thomas of which name was married to the sister of King James III. of Scotland. This noble, however, falling into the

king's displeasure, was attainted for high treason; and his wife, being divorced from him, was given in marriage to James Lord Hamilton, who was created earl of Arran. From this marriage sprang the celebrated ducal house of Hamilton, which claimed to be next in royal descent to the Stuarts, and to be hereditary successors to the throne of Scotland, in the case of failure of the male line. The constant intermarriages of the Scottish kings and princesses with the families of their great nobles, led to the occurrence of many of their quasi-royal lines; all of which, more or less remotely, pretended to the crown, and caused continual difficulties and insurrections, connected with that worst of evils to a monarchical country, a disputed succession; the principal of them were the Darnley Lennoxes, the Hamiltons, and the Douglasses, all of whom, at a feud more or less constantly with one another, were always turbulent and troublesome vassals of the crown. In the reign of James IV., the earl of Arran was sent with an army of 10,000 men to reinstate the king of Denmark, uncle to the Scottish monarch, in his dominions, from which he had been ejected; and fulfilling his commission with great distinction, returned triumphantly to his own country. After the death of James IV. at Flodden, and the coronation of the infant king James V., and the appointment of the duke of Albany to be regent, Arran was constantly in a state of insubordination and disobedience to the existing government, which was itself in a most unsettled state; at one time Arran, and at another the queen mother Margaret of England, who had married the earl of Angus as her second husband, holding the reins of state. At length matters came to such a pitch of animosity amongst these warlike nobles, that the earls of Lennox and Arran, taking up arms, fought a pitched battle at the head of their vassals near the town of Linlithgow, in which Lennox was slain; this event giving rise to a deadly feud between the two families, which produced the most detrimental results to the kingdom of Scotland, and to two successive queens who governed that fierce and factious country. After the death of James V., during the minority of the beautiful and unhappy Mary Stuart, the earl of Lennox (who had married the lady Margaret Douglas, her father's half-sister, being the daughter of his mother Margaret of England, by her second husband the earl of Angus), the earl of Arran, and the cardinal Beaton all contended with one another, and in some sort with Henry VIII. of England, for the possession of the young queen's person, the two earls and the king all desiring her hand in marriage for their sons, by which means they expected to secure the crown of Scotland to their own families.—Arran, however, maintained the office of governor, and being unable to compass the marriage of Mary with his own son, consented to her union with the dauphin, afterward Francis II. of France, and having administered the govern-

ment until she attained her majority, resigned his office to the queen mother, whom Mary appointed her regent, during her absence in France, receiving in compensation for his sacrifice the gift of the dukedom of Chatelheraut, under the great seal of France, and the appointment of his son to the captaincy of the Scottish archer guard in France.—After the death of Francis II. and the early widowhood of Mary, earnest endeavors were made to bring about a marriage between her and this young lord, who, on the elevation of his father to the rank of duke of Chatelheraut, had succeeded to the title of the earldom of Arran; and it appears that strong hopes of succeeding in his suit were held out to him by the king of Navarre, and other persons in her confidence. It is not shown that Mary had ever the slightest inclination to this young man, although he was handsome, accomplished, full of talent, and educated in all the graces and refinements of the court of France; he, however, contracted a hopeless and despairing passion for her, which, when it failed wholly of success, turned into absolute madness, so that he was for a time a confirmed lunatic. Shortly after the commencement of his frenzy, he was prevailed upon by Bothwell and his father, to enter into a plot for the seizure of the queen's person, her imprisonment at Dumbarton, and the murder of her ministers; but in a lucid interval he became aware of the iniquity of the conspiracy, and revealed it to the queen and her council. How far Arran's revelations were founded on fact, how far they were the consequences of his insanity, still remains uncertain, but it seems to be indisputable that they had some foundation in fact. Arran, who was clearly insane, was long kept in confinement, not as a prisoner, but as a lunatic. From this time forth, this unfortunate nobleman disappears from history.

ARRAS, a fortified city of France, capital of the department of Pas-de-Calais, 100 miles N. N. E. from Paris. It is the birthplace of Lebon, Robespierre, and Damiens. It is strongly fortified, and has manufactures of thread, lace, and woollens; pop. 24,321. Two important Roman Catholic councils have been held here, in 1025 and 1490, and in the 15th century two treaties were concluded in Arras. In 1477 Louis XI. besieged the town in person, assaulted it, and drove out all the inhabitants, whom he replaced by people drawn from all parts of France, and named it Franchise.

ARRASTRE, the name of mills used in Spanish countries for grinding gold and silver ores. To some extent they are introduced also among other people. They consist of a circular basin of some hard rock, as granite, in the centre of which stands a strong wooden revolving shaft. Four horizontal arms project from this shaft, to which are attached, by chains, large flat stones. As the shaft revolves, these are dragged round in the basin, crushing the ore washed in from the stamps, or from the other machines, by which it has been broken

into small fragments, and prepared for the arrastre. The fine ore continually flows out with the surplus water, through conduits prepared for it in the upper edge of the basin. Mules are commonly employed to carry the shaft round, two being harnessed together at each end of a long arm, which passes horizontally through the shaft. The mills are also sometimes worked by being geared to the other machinery of large mills, which may be carried by steam or water power. The arrastres are a poor contrivance, accomplishing very little for the power required. They are, however, of simple construction, demand very little attention to keep them in repair, and if well made, are very durable, while the materials they require are always to be easily obtained in the remote regions in which they are generally used.

ARRE, a river of central Africa, and affluent of the Shari, which flows into Lake Tchad near its junction with the Shari. This river is called the river of Logona, from the town of that name, which lies on its banks. Higher up, Dr. Barth, in 1851-'2, found that it was called Serbenel. The name Arre is given by Dr. Vogel, who came upon it in lat. 9° 50' N., about 10 miles E. of the N. edge of Lake Tubori. This is the appellation under which it goes with the Musgo, who dwell on its banks. When Dr. Vogel saw it, in the beginning of the rainy season of 1854, it was about 2,000 feet broad in lat. 10°, and averaged 15 feet deep. In a few places sand-banks extended across the river, and diminished its depth to 6 or 8 feet. The current ran about 4 miles an hour. From an examination of the banks, Dr. Vogel concluded that in the most favorable time of the year the Arre attained a mean depth of at least 80 feet. See an account and map of Dr. Vogel's excursion to Musgo and Lake Tubori, in Petermann's *Mittheilungen*, Gotha, 1857.

ARREBOE, ANDERS, a Danish poet and divine, born upon the Schleswig island Arrøe, in 1587, died in 1687. In 1618 he was appointed bishop of Drontheim, but dismissed in 1622. He translated the psalms of David, and as he availed himself of this opportunity to express contrition for the misconduct which to some extent had brought about his dismissal, he was reinstated in his ecclesiastical position, so far, at least, as to be called upon to preside over the church of Vordingborg. His best work is his *Hexæmeron*, in imitation of the poem of the French poet Du Bartas, *La première semaine, ou la création*. The first book of the *Hexæmeron* is rhymed hexameters, the other books are composed in Alexandrines.

ARREOY, the name of a licentious society of Otaheite and the neighboring islands, composed of about 1,000 members, of both sexes, mostly persons of high standing, who indulged in promiscuous intercourse, and bound themselves to destroy their own offspring at the moment of birth. Thousands of Otaheitan infants were killed in this manner by their parents. Malthus speaks of this law of infanticide as in-

stituted for the purpose of averting the danger of an excess of population, while theological commentators trace this monstrous crime to some heathenish religious principle. Until the beginning of this century, this society was, according to Cook and other travellers, in a flourishing condition. Those who did not submit to the law of infanticide were expelled from the society, while to tender-hearted women who spared the lives of their offspring, the appellation of *whannownow* (bearer of children) was derisively applied. The children were generally killed by suffocation.

ARREST, the apprehending of one's person by authority of law, whether in execution of legal process, or by natural right. It does not imply an actual seizure or touch of the body; it is enough for the party to be within the officer's power and to submit thereto. In the case of a felony, private persons may apprehend a party caught in the act or upon fresh pursuit, while officers are justified in making the arrest, without a warrant, upon reasonable suspicion. In the case of a misdemeanor, such as an ordinary breach of the peace, if it be committed within an officer's view he may make the arrest, otherwise not without a warrant; but private persons have no authority so to do, unless specially authorized by statute. In civil cases an officer only can act, and his authority is limited by the process which he is empowered to execute and to the district within which it runs. The maxim that every man's house is his castle holds good as against the law in civil cases alone, the officer not being justified in breaking open an outside door or window to arrest the occupier or his family in the first instance, unless in cases authorized by statute; though he may do so after an escape, or to apprehend one not of the household, after due demand and notice, and may make his way through any inside door, if the outside be open. To obstruct process and to refuse to aid in its execution are indictable offences. Public ministers abroad, members of the legislature, and persons necessarily in attendance on a court of record, are privileged from arrest, either altogether or for the less serious causes.

ARRHIDÆUS, PHILIP, a natural son of Philip of Macedon and the dancing girl Philina of Larissa, died 315 B. C. After the death of Alexander the Great had left all things in confusion, the Macedonian troops in the East nominated Arrhidæus king, with the proviso that the child with which Alexander's wife was pregnant should be associated with him in the government. The claims of Arrhidæus were strengthened by the fact that his wife, Eurydice, was the grand-daughter of Perdicas, Philip's elder brother. Being of weak intellect, he was a mere puppet in the hand of Perdicas. On the death of Perdicas, Arrhidæus and Eurydice were in Cappadocia, where Antipater, the regent of Macedonia, found them and took them over with him to Pella, in Macedonia. After the death of Antipater, the regent Polysperchon and the

dowager grandmother, Olympias, set up by preference to Arrhidæus, Alexander, Roxana's young son. Arrhidæus and his high-spirited wife, Eurydice, protested, called in the aid of Cassander, Antipater's disinherited heir, but falling into the hands of Olympias, were both cruelly murdered by her orders.

ARRIA, a Roman woman who immortalized herself by suicide A. D. 42. Her husband, Cecina Pæstus, was condemned as a traitor to put an end to his own life, by the emperor Claudius. As Cecina hesitated to do it, his brave wife took up the dagger and stuck it to the hilt in her own bosom. Handing it back to her husband she said, *Pæstæ, non dolet*; "Pæstus, it does not hurt," and expired. Pæstus could not hesitate and despatched himself at once.

ARRIAN, FLAVIUS, born in Nicomedia, in Bithynia, A. D. 100, served under Hadrian and the Antonines, was prefect of Cappadocia, fought successfully there against the Goths and the Alani; after which, retiring from public life, he devoted himself to letters. Being a pupil and friend of the great Stoic, Epictetus, he published the moral teachings of his master, wrote his dialogues, of which only 4 books have reached us, known as *Philosophia Epictetæ Monumenta*. He also published works upon history, geography, tactics, and hunting. The best of them is his history of the campaigns of Alexander the Great, written with great critical judgment, accuracy, and impartiality. This has secured to Arrian the first place among the historians of Alexander. The Athenians created him a citizen of Athens under the name of Xenophon, his book being likewise called "Anabasis." With this work his *Indica* is closely connected, in which he describes the Hindoos, their institutions and customs, as they were found by Alexander. He also wrote a history of Bithynia, a work on the circumnavigation of the Black sea, "How to make War with the Alani," and other smaller works, in all of which he is clear-headed, cautious in the selections of his authorities, and easy and unaffected in style.

ARRIAZA Y SUPERVIELA, JUAN BAUTISTA DE, a Spanish poet, born at Madrid in 1770, and died there in 1837. He was in early life connected with the Spanish navy, but a serious illness injured his eyes so much that he was obliged to relinquish his office. Subsequently he was for some time attached, as secretary, to the Spanish embassy at London. In 1805 he took up his abode in Paris for 2 years, when, on his return to Spain, he took an active part in politics, published his *Poesias Patrióticas* and his *Discursos Políticos*, for the purpose of rousing the national spirit. In the latter pamphlet he attacks the Cortes of 1812 and the constitution, and advocates the principles of absolute monarchy. In acknowledgment of this service Ferdinand VII. gradually raised him to an important position in the department of foreign affairs, and eventually to the office of chamberlain. A 6th edition of his poetical

works appeared at Madrid in 1829-'32, and was reprinted at Paris in 1884 and 1841.

ARRIGHI DI CASONOVA, JEAN-TOUS-SAINT, duke of Padua, a French general, related to the Bonaparte family, born at Corte, in Corsica, in 1770, died March, 1853. He entered the army at the age of 15, and took an active part in the Egyptian campaigns, in the battles of Marengo, Austerlitz, Friedland, Wagram, and Leipsic, and in acknowledgment of his gallantry and his devotion to the interests of Napoleon, he was raised to the dignity of duke of Padua, with an income of 800,000 francs, soon after the battle of Friedland. During the battle of Leipsic he distinguished himself particularly by his energetic defence of the suburbs. On Napoleon's return from Elba he sent Arrighi on an important mission to Corsica, and raised him to the rank of peer of France. After Napoleon's downfall he was banished from France, but permission to return was granted to him in 1820, of which, however, he did not avail himself, as he continued to reside in Italy, until 1849, when he was nominated member of the legislative assembly by his native district in Corsica, and after that time he took up his abode in Paris. After the *coup d'état* of Dec. 2, 1850, Louis Napoleon made him one of the members of his senate. Arrighi was appointed testamentary executor of the father of the present emperor, Louis Napoleon.

ARRIS, the sharp edge or angle formed by 2 surfaces meeting each other, applied particularly to the edges in mouldings, and to the raised edges which separate the flutings in a Doric column.

ARROBA, a Spanish measure of weight and capacity. The standard great arroba for wine is 981 cu. in.; the lesser, for oil, is 771 cu. in. Spanish arroba, 25.36 lbs. av.; Portuguese, 32.38 lbs. av. The local arrobas vary between these two. In capacity the Spanish great arroba is 3.54 gallons; lesser arroba, 2.78 gallons. There are also local variations from this to the extent of nearly one-third.

ARROE (or **HARNISH**) ISLANDS, a group of small islands in the Red sea, about 80 miles N. W. of Mocha.

ARROO, **AROO**, or **ARRU**, a group of islands north of Australia, lying between lat. 5° 20' and 6° 25' S., and long. 134° 10' and 134° 45' E. At the end of them is a considerable reef of coral, where pearls and trepang abound. The products are pearls, mother-of-pearl, tortoise-shell, birds of Paradise, and trepang. Dobbo, a town in the island of Warud, is the entrepot of the islands, and imports yearly British goods—calicoes, iron, hardware, and gunpowder, shipped from Singapore—to the amount of \$150,000. Pop. 60,000, a mixture of the Malay and Polynesian negroes, of which a portion profess Christianity.

ARROWROOT, a name loosely applied to the starch extracted from a number of roots and grains, as the *maranta*, manihot, taca, arum, potato, &c. It was originally limited to

the starch of the *maranta arundinacea*, a plant which grows in the East and West Indies, and which was considered a specific for the wounds caused by poisoned arrows. It is a simple food, in high repute for invalids. Not containing nitrogen, it is well adapted for producing fat and promoting the warmth of the body. According to Liebig 4 pounds of it contain as much carbon for supplying animal heat by its combustion as 15 pounds of animal flesh. In its preparation the tubers are mashed, and the pulp soaked in water. This dissolves out the starch, which is separated from the fibre by straining. After settling, the clear water is drawn off, the starch is washed with fresh water, and again allowed to settle. It is finally dried in the sun. From the false arrowroots, and from the mixtures of the different kinds, the genuine *maranta* arrowroot can be distinguished by the use of powerful microscopes. The different forms of the little granules are very characteristic when thus observed. The most common adulterations are with the cheap potato starch, sago, and manihot, or tapioca. The granules of the potato are of very irregular, ovoid, and truncated forms, and of various sizes, from $\frac{1}{16}$ to $\frac{1}{8}$ of an inch in diameter, while the particles of the arrowroot are very regular ovoid forms, and of nearly equal sizes. Dilute nitric acid is also a good test. When triturated with it in a mortar, arrowroot changes into an opaque paste, which is some time in becoming viscid. But potato and flour starch thus treated form immediately a transparent, thick paste. From the inferior starches alcohol extracts an unwholesome oil of disagreeable odor, but none from arrowroot. The composition of the fresh root was ascertained by Benzon to be as follows: volatile oil, 0.07; starch, 26; vegetable albumen, 1.58; a gummy extract, 0.6; chloride of calcium, 0.25; insoluble fibrine, 6; and water, 65.5, in 100 parts. Of the starch 23 parts are obtained in the form of powder, and the other 3 are extracted in the form of paste from the parenchyma with boiling water. The great variety of sources from which the different arrowroots are obtained—from different countries and different varieties of plants—renders it important that the name should be applied with more definiteness for the protection of the public in this article of food. Thus we have a so-called arrowroot brought from Florida, derived from a plant allied to the sago-palm. This plant seems peculiarly adapted to certain portions of southern Florida. On the borders of an immense basin termed the everglades, is a strip of land averaging some 15 miles in width, barren in soil, and covered with dwarf pines. Upon this miserable tract of country grows, in the greatest profusion, the coontee, or Florida arrowroot, which, though of an inferior quality, containing only 12 per ct. of starch, gives a high value to a region, which would otherwise be entirely worthless. The expense of digging and preparing the root is very trifling, and there is no difficulty in propagating it, as wherever a small

piece is left in the ground there will appear a new plant.

ARROWSMITH, AARON, an English geographer and map-maker, born in Winston, Durham, July 14, 1750, died April 23, 1823. He went to London in 1770; in 1790 he published his large map of the world on Mercator's projection, containing a great amount of new matter, which soon brought him into general notice. He published, altogether, more than 180 maps, which were highly esteemed throughout Europe, particularly for the excellence of the engraving.

ARSAOES, the founder of the great Parthian monarchy, which was later the most effectual barrier to the further progress of the Roman arms and empire in the far East. Justin speaks of him as "of doubtful origin, and used to live by robbery." In the reign of Antiochus Theos, of Syria, 250 B. C., Arsaces led the revolt of the Parthians, and declared himself their independent king, a position which he successfully maintained. Out of respect for his memory, his successors called themselves Arsacides.

ARSENAL (Lat. *ars navalis*, a naval citadel), a public establishment designed for the manufacture and storage of arms, and all military equipments, whether for land or naval service. The arsenals of Europe are immense enclosures, containing stores of military engines and pieces of artillery arranged in order and classes, halls in which magazines of musketry are kept, adjacent buildings furnished with foundries and forges, numerous smaller workshops, and offices or bureaus for the superintendents of the establishment. The principal arsenal of England, after the tower of London, is that of Woolwich, remarkable for its size, and in which 100,000 muskets are arranged in admirable order. The other great English arsenals are those of Deptford, Chatham, Sheerness, Portsmouth, and Plymouth. France has 8 arsenals of the first class, those of Brest, Toulon, and Rochefort. There was formerly an arsenal at Paris, which was destroyed in 1568 by the accidental firing of 15 or 20 tons of powder which its several buildings contained. The terrific explosion was heard at Melun, 28 miles distant, and sent portions of the walls of the arsenal into the suburb of St. Marceau. The fishes were killed in the river, the neighboring houses were ruined, and 80 persons thrown into the air fell in fragments. The principal arsenals in Spain are at Cadiz, Carthagena, Barcelona, and Gibraltar, the last belonging to the English; the principal in Italy are at Genoa, Naples, Venice, and Trieste; in Denmark, at Copenhagen; in Sweden, at Carlscrona; in Russia, at St. Petersburg, Cronstadt, and Kiev; in Turkey, at Constantinople; in Egypt, at Alexandria; in Brazil, at Rio Janeiro; in Germany, at Prague, Vienna, Budweis, and Berlin. Dantzic and Hamburg were made maritime arsenals by Napoleon, but have again become trading ports. The arsenal of Venice was built in the 14th century by Andrea Pisano, and has its principal

gate adorned with 2 white marble lions, which were taken by the Venetians from the Piræus of Athens. In the United States of America the term arsenal is applied particularly to places for the storage of arms and munitions of war, and places for their manufacture are called armories. In this sense the principal arsenals are at New York, Boston, and Baltimore, and the only public armories at Harper's Ferry, Va., and Springfield, Mass. Each of the two armories employs about 250 workmen.

ARSENIC (Gr. *arsenikon*, masculine, so named from its masculine power in destroying men). The name is now in common use applied to the white oxide of arsenic, or arsenious acid. In ancient times it was a reddish colored mineral compound of arsenic and sulphur, to which this name was given—a substance in use then as a medicine, and also in painting. Metallic arsenic occurs native in veins in the crystallized rocks and older slates, and it is also prepared by subliming its oxide in presence of a reducing flux, and protected from the air. Many modern chemists do not regard it as a metal, though it is commonly treated as such. Combined with oxygen, it unites with metals, forming arsenites and arseniates of these metals, but is never itself the base of any salt. The ores of the metal are not therefore carbonates and sulphates of its oxide, as is common with other metals, but they are combinations of the metal itself with sulphur, forming the sulphuret, and this combined with iron, cobalt, or nickel; or they are oxides of the metal; or else compounds of its oxides with other metals, as above mentioned. It is remarkable as the most volatile, and one of the most combustible of the metals. It is readily sublimed at a temperature of 360° F., apparently before it melts. At a greater heat it takes fire, and burns with a pale, blue flame. In subliming, it gives out dense fumes of a peculiar garlicky odor, that distinguish it from other substances, even when present in very minute quantity. It is more brittle than antimony, so much so, that it may be reduced to fine powder in a mortar. Freshly prepared, it has a brilliant metallic appearance, a bluish white color, and crystalline structure, but these properties are not permanent in the air. The metal becomes black in this, and crumbles to powder. In water, it may be kept without change. Its specific gravity is 5.96. It is the softest of the solid metals, its hardness being rated on the mineralogical scale at 8.5. Arsenic readily combines as an alloy with other metals, rendering them more fusible and brittle. Its presence is particularly injurious in iron ores, making the cast metal exceedingly brittle, but it gives great fluidity to the melted iron, so that for fine castings, that do not require much strength, but sharply defined and delicate outline, it is sometimes desirable. It also increases the brightness of some alloys. It is not employed for any useful purposes in the metallic state.—Arsenious acid, or white arsenic, is the most common combination of this metal. It is the

sublimate, which escapes when arsenic is heated in the open air. The metal combines in the proportion of 1 equivalent with 8 of oxygen, the compound consisting of arsenic 75.76 per cent. and oxygen 24.24 per cent. The sublimate, after exposure, is a white powder, but may be collected in the form of a glassy, transparent cake, or crystallized in octohedrons. It is partially soluble in boiling water, and less so in cold water. The solution is slightly acid, having but a feeble reaction upon litmus paper.—The following are some of the most important tests given for detecting the presence of this poison: The blow-pipe develops its peculiar odor, with little liability of mistake, in arsenical matters, heated on charcoal. It also reduces the metal, and causes it to condense in the form of a metallic ring in the cold part of a glass tube, in which the substance containing arsenious acid has been placed with carbonate of soda and charcoal, and heated. The presence of arsenic may be shown by this method, when the particle containing it is so small as to be invisible to the naked eye, as in the following manner, communicated by Prof. A. K. Eaton, of New York: The microscopic particle is placed in a bulb of a small glass tube, and a fine splinter of charcoal is placed by the side of it. The whole should then be thoroughly dried. The neck of the bulb is next to be drawn out to a capillary tube, and cooled. On applying heat to the matter in the bulb, this produces, by sublimation, a plainly visible arsenical ring in the fine bore of the tube.—The acid is precipitated from its solutions by sulphuretted hydrogen in the form of tersulphuret of arsenic of a lemon-yellow color. This is a very accurate test, and is so delicate that the yellow tint is apparent when only a ten-thousandth of the acid is present, and the precipitate when the arsenious acid is in the proportion of 1 part to 80,000 of water. It is precipitated in a white powder by excess of lime-water, when forming one five-hundredth part of the liquid. Ammonio-sulphate of copper gives an apple-green precipitate, apparent when the acid forms one twelve-thousandth part. A still more delicate test is that of Prof. Reinsch, to place a slip of bright copper-leaf in the aqueous solution acidulated with hydrochloric acid. A gray film of arsenic is deposited upon the copper, showing the presence of less than one hundred-thousandth part of the acid. It is affirmed that even a two hundred and fifty-thousandth part of arsenic will not escape detection by this test. Nitrate of silver gives with it a yellow precipitate.—It should be borne in mind, in attempting to determine the presence or absence of arsenious acid in any mixture in which organic substances, particularly those which are not volatile, are present, that some of these substances often produce very similar reactions, and, on the other hand, that they prevent or modify those which arsenious acid should produce in mixtures where no organic substances are present.—“Marsh’s apparatus” has been

long known as affording an easy means of detecting the presence of arsenious acid. The process depends on the property possessed by arsenic of forming a gas with hydrogen, and depositing itself, in the metallic state, upon the surface of a cold plate, held over the flame of the burning gas. Hydrogen is prepared in the usual way, with granulated zinc and diluted sulphuric acid, in a glass flask provided with a tube of glass drawn out to a small orifice at its outer end; or a mere tube itself may be used, bent in the form of the letter U, one end drawn out, the other left open for introducing the materials, and closed with the thumb when in use. The hydrogen evolved should first be tested by burning it against a porcelain plate to prove that it is free from arsenic, and then the suspected liquid is to be introduced into the apparatus. If it contain any traces of arsenious acid, it will be shown by the bluish white color the flame will assume, by the fumes of the acid, and brown shining spots of arsenic of metallic appearance will be deposited upon the porcelain plates. By heating the glass tube with a spirit-lamp, metallic arsenic will be deposited in the colder part of it, forming a beautiful incrustation. The tube may be cut off at this point, the arsenic be converted into arsenious acid by heat, dissolved in hot water, and tested by the ammonio-sulphate of copper and nitrate of silver. This apparatus has been modified by Dr. Ure, so that the gas may be made at will to pass through the solutions, by which the arsenic is precipitated, or to deposit the metallic incrustation in the tube, or the spots upon the plate. In its most simple form, however, it is a very useful contrivance for detecting arsenic. Antimony combined with hydrogen produces a spot that may be confounded with that of arsenic. But a solution of hypochlorite of soda instantly dissolves arsenical spots, and has no effect upon those of antimony. The arsenical spots also are volatilized at a temperature of 500° applied by a bath of olive oil, while the antimonial are unchanged. The proper solvent for organic matters supposed to contain arsenic is a mixture of 8 parts of hydrochloric and 1 part of nitric acid, and the quantity of this should be equal in weight to the organic substance, which, before being dissolved, should be cut into small pieces and dried at a gentle heat. The mixture being distilled, the arsenic, if present, comes over in the form of the volatile terchloride, which is then to be converted into the tersulphuret by sulphuretted hydrogen.—Arsenious acid is manufactured on a large scale at Altenburg, and Reichenstein, in Silesia, from the ore called arsenical iron. In many other places it is obtained as a secondary product in the treatment of cobalt ores, and of other metallic ores with which arsenic is associated. The process consists in roasting the ore in large muffles, 10 ft. long and 6 ft. wide, in charges of 9 or 10 cwt. each, and collecting the vapors, as a sublimate, upon the walls of a succession of chambers, arranged in a tower through which

they pass, and from which the incondensable gases escape by a chimney. The muffles are placed inclining upward from their mouth, and are left open for the passage of heated air to aid in subliming the arsenic and converting it all into arsenious acid. A charge is worked off in about 12 hours, and is immediately followed by another. Charcoal is the fuel used, as very little more heat is required than what is evolved by the chemical changes. The quantity consumed is very small. The purest arsenic is found in the flues and chambers nearest the furnace; in the upper chambers it is intermixed with the condensed sulphurous vapors. To purify it for market it is all sublimed again. It is placed in cast iron or porcelain pots, which hold $8\frac{1}{2}$ cwt. each, and these are set vertically in a furnace. They open above into sheet-iron drums, which serve as condensers, and which are connected by a funnel with the condensing chamber. The fire must be carefully regulated to maintain the proper temperature for the acid to sublime in the form of a glassy cake. If the heat is too high, metallic arsenic is apt to be sublimed and mixed with the acid appearing in dark spots. This must be picked out, or the whole sublimed over. The preparation of arsenious acid is a most dangerous occupation. The workmen employed generally die before the age of 40; indeed, their mean term of life is stated to be only from 30 to 35 years. Dumas states that they are compelled to avoid alcoholic drinks, and live principally upon leguminous vegetables, with plenty of butter, taking very little meat, and that very fat; and to each man 2 small glasses of olive oil are administered daily. In removing the acid from the chambers the workmen are completely enveloped in a dress and helmet of leather, the latter furnished with glass eyes. The passage for the air is protected with a wet sponge, by which it is filtered as it passes to the mouth and nostrils.—Arsenious acid is also found native, crystallized in octohedrons and capillary forms, at Andreasberg, in the Harz, and at mines in Hungary and Bohemia. Combined with iron and sulphur it forms the common ore of arsenic, called arsenical iron, or mispickel, which is of frequent occurrence in veins of iron pyrites, and of copper, lead, silver, zinc, cobalt, nickel, and tin ores. This ore is found in many localities in Connecticut and New Hampshire particularly, but is not rare in any of the New England states, or wherever pyritous ores are found along the range of the primary rocks of the Appalachian chain. The acid is also found in the ashes of many plants; in certain soils and mineral waters; and Orfila has detected it in the earth of graveyards. Its diffusion in minute quantities is very remarkable.—The uses of arsenious acid are principally in medicinal preparations, such as Fowler's solution, the basis of which is the arsenite of potash; it is also administered, without combination with other substances, as a tonic. It acts powerfully in doses of $\frac{1}{2}$ to $\frac{1}{3}$ of a grain, warming and exhilarating the system, and increasing its activity

and vigor. It is stated that in some parts of the world, as in the mountainous region of Hungary, it is systematically taken by the peasantry, both fasting and as a seasoning with their food. But this statement of Dr. Tschudi, in a letter to the *Gazette des Hopitaux*, which, with many wonderful details, has been copied into a great number of publications, is not worthy of credit. The impression among medical men is that from 2 to 8 grains of arsenic is a fatal dose, though larger doses are sometimes rejected from the stomach by vomiting. The system, moreover, becomes more and more susceptible to mineral poisons; so that a smaller dose after a time produces the effects that a large one would at first. Johnston, however, in his "Chemistry of Common Life," inclines to the opinion that arsenic may be found to lessen the natural waste of the body and the discharge of carbonic acid from the lungs, and consequently the quantities of oxygen required. Breathing will hence be less difficult in ascending hills, and the fat of the food will not pass off in carbonic acid gas, but go to increase the plumpness of the individual. These opinions are probably based on the statements of Dr. Tschudi. In desperate cases of bilious fever arsenic is resorted to as a tonic more powerful than quinine. By Dr. Tschudi it has been given with success in asthma. It is administered to horses to increase their spirit and improve their coat. It is tied in a rag to the bit, and is dissolved by the saliva. The horse likes it, and is very possibly improved in condition by its use; but when the habit of taking it is left off he falls away, and never afterward has health or strength. In the western States it appears from recent accounts that it is advantageously administered to hogs that are troubled with attacks of the kidney worm, and that it is the only medicine that saves them when thus attacked. Whether the large doses given for this purpose have any effect upon the pork, is not stated. The acid is also employed in the glass manufacture to destroy the color imparted by the protoxide of iron, and by taxidermists in preserving specimens of natural history and skins from insects and putrefaction. It is lately proposed to introduce it into the iron employed in ship-building, for the purpose of preventing the attachment of barnacles, and other animal matters to the bottoms of ships. This is done by mixing it with the iron in the puddling furnace, in proportions varying from 2 to 5 per cent.; it is thus diffused equally through the whole mass of iron, and its effect continues till the metal is worn out.—*Antidotes.* When arsenious acid has been taken in poisonous doses, an emetic should be immediately administered, or the stomach pump at once applied. This is to be followed by doses of freshly precipitated peroxide of iron, or of caustic magnesia mixed with water. The peroxide of iron may be prepared by dissolving copperas in hot water, or pieces of metallic iron, as tacks, in nitric acid. To the copperas solution nitric acid should be added, till the solution becomes yellow, heat being ap-

plied at each addition of acid. The peroxide of iron is precipitated from this solution by ammonia, either the aqueous solution or the carbonate. The precipitate, filtered through paper, should be washed with boiling hot water; it is then mixed with water, and drank. The effect of the peroxide of iron in neutralizing the action of arsenious and arsenic acids is seen in the harmless nature of the chalybeate waters of Wativiller, in which arsenic was found by Lassaigne to be present to the amount of 2.8 per cent.—*Arsenites*. Arsenious acid unites with bases, and forms arsenites. Those of any interest are arsenite of potassa, which has been already referred to; Scheele's green, and Schweinfurth's green. These are beautiful greenish-colored powders, used as pigments. They are arsenites of copper, of very poisonous qualities; yet it is stated that they are sometimes made use of to color confectionery. The bright green colors of some paper-hangings are also produced by these combinations, and instances are recorded of their use being attended with dangerous consequences to the occupants of the rooms.—*Arsenic acid* is a deliquescent vitreous substance, of specific gravity 3.4 to 3.7. It consists of 1 equivalent of arsenic and 5 of oxygen, 65.22 parts by weight of the former, and 34.78 of the latter. It is soluble with great difficulty, and after long digestion in hot water. The solution possesses acid properties. The compound is a more virulent poison than arsenious acid. Its combinations with bases are arseniates. These possess no particular importance. It is prepared by dissolving metallic arsenic in nitric acid, evaporating to dryness, dissolving up any arsenious acid, and again evaporating. The combination of arsenic and hydrogen gas has been alluded to in speaking of Marsh's apparatus. This gas is generally known as arseniuretted hydrogen, and also arseniohydric acid. Realgar, or red orpiment, is a native combination of arsenic and sulphur, found in Germany, Hungary, and other places. It is also artificially prepared for a pigment, being of a beautiful orange-red color. In fire-works it gives a very brilliant white flame. It consists of 1 equivalent of arsenic and 2 of sulphur. Yellow orpiment contains one more equivalent of sulphur. This is also found native, and is prepared artificially. It is the basis of the pigment called king's yellow. It is used for dissolving indigo, in the cold vat, and also in calico printing. The name, orpiment, is a corruption of its Latin name, *auri pigmentum*, golden paint, so named because of its color, and because it was supposed to contain gold.

-ARSENIOUS. I. A deacon of the Roman church, renowned for his learning and piety. Pope Damasus sent him to Constantinople A. D. 383, to act as tutor to Arcadius, son of the emperor Theodosius. The emperor one day finding Arsenius instructing his son in a standing posture, while the prince remained seated, corrected him with severity, but with so little effect, that Arcadius soon after at-

tempted to make way with him. The officer whom he wished to employ for the purpose warned Arsenius of his danger, who fled to the desert of Scete, where he lived many years. He died at Troë, aged 95. II. A Greek writer, at the close of the 15th century, who died at Venice in 1485. He abandoned the Greek for the Latin church, and was made archbishop of Malvasia, in the Morea, by Paul III. He published a collection of Apophthegms of great men, in Greek, and Scholia on 7 of the plays of Euripides. III. Bishop of Constantinople in the 18th century. He excommunicated Michael Palæologus for depriving John Lascaris of the crown, and upon his refusal to grant him absolution, unless he would resign the throne, he was banished, and died in exile.

ARSINOE, a city of Egypt, and the metropolis of one of the nomes or districts into which that country was anciently divided. It lay west of the Nile, and not far from Lake Moeria. Ptolemy Philadelphus gave it that name in honor of his favorite queen Arsinoë. Originally, however, it was called Crocodilopolis ("the city of crocodiles") by the Greeks, because that animal had a temple there, in which he received divine honors from the Egyptians, and because of the number of dead crocodiles which were interred near the city. The city no longer exists, but its ruins may be seen in the vicinity of the modern Medinet el Faïoum.—Also, a city of Egypt, which stood at the extremity of the Red sea, near the site of the present town of Suez. Ptolemy Philadelphus considerably enlarged and improved this city, and called it Arsinoë, after his sister and queen. Arsinoë was connected with the Nile by the Ptolemean canal, and was long the great eastern emporium of Egypt. But the dangers incidental to the navigation of the northern section of the Red sea led in time to the construction of harbors lower down the coast, and to the diversion of trade to new channels.

ARSINOE. I. A concubine of Philip, the son of Amyntas, who became the wife of Lagus, a Macedonian general, and the mother of Ptolemy I., king of Egypt. She was said to have been pregnant at the time of her marriage, and her son Ptolemy was generally regarded as the brother of Alexander. II. A daughter of Ptolemy I., king of Egypt, was married to Lysimachus, king of Thrace, who had cast off his former wife Amastria, that he might espouse the lovely Egyptian. Arsinoë being determined to secure the Thracian sceptre for her own issue, caused Agathocles, the son of Amastria, to be put to death. The consequences of this crime, however, were such as Arsinoë had not anticipated. Lysandra, the widow of Agathocles, fled to Syria with her fatherless children, and implored Seleucus to avenge the murder of her husband. A war ensued between the Thracian and Syrian monarchs in which Lysimachus lost his crown and life. After this catastrophe Arsinoë sought refuge in Cassandria, a city of Macedonia, where, with her sons

by Lysimachus, she remained in security for some time. But Ptolemy Ceraunus having assassinated Seleucus, and seized the crown of Macedonia, became desirous of gaining Cassandria, and getting the heirs of Lysimachus into his power. To effect these objects the more easily, he made an offer of his hand to Arsinoë, who consented to accept it. No sooner, however, did Ceraunus find himself in possession of the city than he caused the helpless offspring of Lysimachus to be slain in the presence of their mother. The disconsolate Arsinoë now fled from Cassandria to Samothrace, whence she proceeded to Egypt, the country of her birth. Here she was kindly received by her brother Ptolemy Philadelphus, the king, who speedily became enamored of her and made her his queen. She had no issue by Philadelphus. III. A daughter of Ptolemy Euergetes, married to her brother Philopator, whom she accompanied to the war against Antiochus. After her return to Alexandria, a courtier named Philamon put her to death by order of the king. But her murder was subsequently avenged by her friends, who killed Philamon and all his family. This queen bore Ptolemy Epiphanes to Philopator. IV. A daughter of Ptolemy surnamed Auletes, was proclaimed queen by the Alexandrians after her brother Ptolemy Dionysius had become prisoner to Cæsar. She subsequently, however, fell into the hands of the conqueror, was carried to Rome, and served to adorn his triumph. Her deportment while passing through that cruel ordeal excited the sympathy of the Roman people, and of Cæsar, who presently restored her to liberty, and permitted her to return to Egypt. Her end was unfortunate. Antony at the instigation of her sister Cleopatra, had her taken from the temple of Diana at Miletus, whither she had fled for refuge, and barbarously murdered.

ARSON, in criminal law, the malicious and wilful burning of the house of another. To constitute the offence 8 things must concur: 1. There must be an actual consumption by fire of the whole or part of the house (which comprehends not only the dwelling but outhouses appurtenant thereto); the slightest charring, but not the scorching of the wood, is enough. 2. The house burned must be another's: for a man to burn down his own is not arson, though if in so doing he set fire to his neighbor's, it is the same as if that had been fired in the first instance, since a man has no right to use his own property to the injury of another's, and is presumed to intend the natural consequences of his acts. 3. The burning must be malicious and wilful; if it result from accident, or mischance, it is not arson, but trespass. These rules of the common law have, however, been modified more or less by statute, both in England and America. It is made arson to burn other things, such as cornricks in England, beside houses; and the general and statutory provisions are such as not to make it a necessary ele-

ment of the crime, that the house should belong to another, especially if it be a dwelling-house, in occupation at the time. Most statutes on the subject establish different degrees of arson, according to the enormity of the offence; to each of which proportionate penalties are affixed.—The old writers speak of arson, highway robbery, and ravage (*depopulatio agrorum*), as hostile acts, bordering upon treason, all of which were denied benefit of clergy at common law. In the reign of Henry VI., arson was by statute declared to be high treason, and visited with the penalties thereof. It has always been punished with great severity. In the reign of Edward I. the incendiary was, by a kind of *lex talionis*, burned alive. Arson is still a capital offence in England, and in many of the United States, in the case of a dwelling-house burned in the night-time. In some of the states the penalty of imprisonment for life, or for a less period of time, has been substituted for that of death. Arson of a less heinous character is punished less severely. The tendency in this country is to confine the punishment of death to the crimes of treason and murder.

ART, *FINIS ARTIS*. Art is the means employed by man to adapt existing things in the natural world to his material necessities, and his intellectual tastes. Man finds himself in the world without food, raiment, or habitation; this first want stimulates his invention, and out of some material at hand he constructs an implement to secure food; next the means of producing fire; then he invents cooking utensils, and as he advances in civilization, he raises cooking into an art, regulated by the combined sciences of physiology and chemistry. Thus he invents machinery of every variety to carry on the necessities and luxuries of life by art. For instance, the Esquimaux' hut and the wigwam of the North American Indian, supply the rude want of shelter; but with the increase of man's abilities and resources, necessity and taste urge him on to the most complicated and beautiful structures. The first music is merely a discordant succession of sounds, but by means of art it has been carried to the most perfect harmonies. In the same way the savage war-dance has been converted into an elegant and health-promoting exercise. The operation of art is also seen in the indescribable varieties of costume with which man from time to time has disfigured or adorned himself. In the beginning, art and invention are synonymous; for instance, in the manufacture of glassware, the means were invented by the aid of art; but the art of producing those wares continues, and is improved after the invention has been perfected.—The mechanic arts are those which comprehend the means of promoting and facilitating the necessities of existence. The fine arts begin with ornamentation. A canister or flask well secured, is perfectly adapted to contain powder with safety; but when it becomes carved or embossed with emblems of the hunt, it becomes a product of taste. A trough of bark

so placed as to convey water from one point to another, is an example also of art; but when the Romans built their famous aqueducts, with arch upon arch stretching for miles across the country, they had called in the aid not merely of art, but of fine art, and that on a very grand and noble scale. So too the plainest and simplest structure to protect against the elements, might be used as a place for divine worship; but when the Egyptians and the Grecians built their temples, the fine arts were called into use to adorn them with symbolic carvings and symmetrical forms. As more striking examples of the fine arts in this respect, the church of St. Sophia at Constantinople, and St. Peter's at Rome, may serve. In these, we find architecture, sculpture, and painting, in the most elaborate and ornate combination, only complete, however, when we have also the ceremonies of the church and the sublime music of religion. Art administers to the necessities of life, while in addition to this the fine arts address the imagination. Thus in civilized nations, in proportion to the development of the intellect and fancy, we find the fine arts entering largely into the ornamentation of even the most common as well as the greatest objects. Each of these is treated under its appropriate head. See ARCHITECTURE, DANCING, MUSIC, PAINTING, and SCULPTURE. See also *Æsthetics*.

ART AND PART, a Scotch law term, signifying complicity in both contrivance and perpetration of crime; at once covering our own law terms accessory and principal.

ART-UNION, a name given to societies for the encouragement of the fine arts by the purchase of works of art out of a common fund raised in small subscriptions or shares, and their distribution by lot. The idea originated with M. Hennin, an eminent French amateur, who in 1814 founded a society of this kind in Paris, which in 1816 was merged into the *Société des amis des Arts*. In Germany, the first art-union was founded at Munich in 1828, by Domenico Quaglio, Stieler, Peter Hess, and other artists. This union has more than 8,000 members, and in the 18 first years of its existence paid on an average \$4,000 a year for works of art. The king of Prussia and Alexander von Humboldt took an active part in the establishment in 1828 of the Berlin art-union. Since that time, Dresden and Leipsic have followed the example: indeed, art-unions have spread all over Germany, until at this moment there are 60 in active operation. In Dresden, Leipsic, Breslau, Stettin, &c., fine galleries of art are connected with them. In Bremen, a fine hall has been built for the use of the art-union. The Düsseldorf and Frankfort-on-the-Main art-unions, the Prague art-union under the direction of Count Franz Thun, the Austrian art-union, which was established in 1850, independently of the Vienna art-union, all pay much attention to monumental and architectural art. The Cologne art-union takes an active part in the completion of

the Cologne cathedral. In 1851 Roman Catholic art-unions were set on foot, and at the synod of Elberfeld, in 1851, the question of Protestant art-unions was agitated, and in 1853 several evangelical societies were established. All these various art-unions have given a powerful impulse to the fine arts at home and abroad, especially that of Düsseldorf, which was founded in 1839, and during the 20 first years of its existence laid out on an average \$10,000 a year for works of art, as for instance: 24 paintings for altars, 11 oil paintings for public buildings, including the frescoes in the city hall of Elberfeld, and the fresco paintings in the emperor's hall at Aix-la-Chapelle. From Germany the idea spread over Sweden, Norway, Denmark, and in 1884 found its way into Great Britain. From a report issued in 1886 by a select committee of the house of commons, we take the following remarks:—

"These associations, for the purchase of pictures to be distributed by lot, form one of the many instances in the present age of the advantages of combination. The smallness of the contributions required brings together a large mass of subscribers, many of whom, without such a system of association, would never have been patrons of the arts."

Some time after the appearance of this report, in 1837, a number of gentlemen, among whom were Mr. Ewart, M. P., the chairman of the select committee referred to, and 4 other members of parliament, established the "London Art Union," which increased so rapidly that the subscription, which in 1837 amounted to only about \$500, reached in 1856 the amount of about \$90,000. The success of the London art-union has given rise to many similar associations in various towns of England, and also to an association for the promotion of the fine arts in Ireland. The first society of this description in the United States was founded in New York in 1839 under the title of the "American Art Union," and was in active existence until the close of 1851. In 1849 it had 18,960 members and an income of \$96,300. It distributed that year 1,010 works of art, including paintings, bronzes, and medals, and also 18,960 engravings, and as many more sets of lithographed designs in outline. Its operations for 18 years may be summed up as follows: Number of subscriptions, 89,610; amount of receipts, \$458,358 20; number of paintings, statuettes, medals, and bronzes, purchased for distribution, 4,402; number of engravings, including sets of prints and lithographed outlines given to its members, 165,767. During the last 8 years it also furnished to each of its subscribers an illustrated monthly publication devoted to the affairs of the institution, and also to art news and essays, and criticisms on art subjects. The close of the American art-union in 1851 was exclusively owing to the interference of the law in the state of New York with the system of distribution by lottery. The same difficulty existed in England in reference to the London art-union; but there it has been obviated by a new act of parliament. It seems that in New York a similar act could not be passed without a change of the constitution.

ARTA (anciently *Ambracia* and *Ambracius Sinus*), a gulf and town of Albania, on the boundary line between Turkey and Greece. The gulf is 25 miles long and from 4 to 10 wide. The entrance is narrow, of about half a mile general width. The gulf is surrounded with high land. On the northern side of the entrance is the small town of *Prevesa*, and on the south is the town of *Vonitza*. The rivers *Luro* and *Arta* flow into the gulf; they are only navigable for boats. The little town of *Arta*, from which the gulf takes its name, is about 7 miles up the river. It is governed by a *Bey*, and is in the pashalic of *Yannina*. It was stormed by *Marco Bozzaris* in 1828 during the war of independence, and has never recovered its former prosperity. A bridge built by the Venetians over the river still remains; it is 200 yards long, and the height of the centre above the river is 100 feet. The gulf abounds with sardines.

ARTABANUS, a native of *Hyrcania*, who assassinated *Xerxes*, and incited one of his sons to kill another in order that he might then kill the survivor and seize the crown. He failed in the attempt to murder the second son, and was killed himself.

ARTABAZUS, son of *Pharnaces*, a Persian who flourished in the reign of *Xerxes*. He commanded a division at *Platæa*. After the defeat, he led his men by forced marches to *Byzantium*, whence he transported to *Asia* the remnant of it which cold, fatigue, and the sword, had spared.

ARTALI, GIUSEPPE, a brave soldier and celebrated duellist, was born at *Mazara*, in *Sicily*, and died at *Naples*, in 1879, aged 51. He was knighted for his bravery during the siege of *Candia* by the *Turks*, and on his return to *Europe* was much noticed by several princes, the duke of *Brunswick* and the emperor *Leopold* among others. His skill as a duellist gained him the name of the *Chevalier du Sang*. He cultivated a literary taste, and wrote several poems.

ARTAUD, NICOLAS LOUIS, a French scholar born at *Paris* in 1794; was, under the restoration, one of the professors at the college *Louis le Grand*, when, on account of his liberal opinions, he was requested to discontinue his services. After the revolution of 1830 he became inspector of the academy of *Paris*, inspector-general, chevalier, and officer of the legion of honor. He is the author of an essay on the poetical genius of the 19th century, and of translations of *Sophocles*, and *Euripides*, the comedies of *Aristophanes*, and *Cæsar's Commentaries*. In 1840 the French government sent him to *Algiers* to report on the condition of public schools in the colony.

ARTAUD DE MONTOR, ALEXIS FRANÇOIS, chevalier, a French diplomatist and author, born at *Paris* in 1773, died in 1849, was for many years the secretary of the French embassy at *Rome*, and became the biographer of the pope, *Pius VII.* For some time he was superseded in his diplomatic mission by *Chateaubriand*, who,

however, on retiring after the death of the duke of *Enghien*, made place again for *Artand*, who remained in *Rome* until 1805, when he was appointed *chargé d'affaires* at *Florence*. In 1807 he was suspected of an intention to frustrate *Napoleon's* ambitious designs upon *Tuscany*, and was recalled. In 1830 he retired from public life, and, in the same year, he was elected honorary member of the academy of inscriptions in the place of the *marquis de Villemetil*.

ARTAXATA, an ancient city, on the *Aras*, 68 miles S. S. E. of *Erivan*, formerly the capital of *Armenia*, and now in ruins. It was destroyed with fire by the Roman general *Corbulo*, but rebuilt by *Tiridates*, who called it *Neromia*. In A. D. 370 it was taken by the *Persians*, who partially destroyed it and carried into captivity most of its inhabitants. In A. D. 450 a famous council was held here, at which the patriarch *Joseph* presided.

ARTAXERXES, or **ARTOXERXES**, a Persian compound word, signifying, according to *Herodotus*, "great warrior," and the title of several Persian kings. I. **ARTAXERXES I.**, surnamed *Longimanus*, according to some authorities, on account of one of his arms being longer than the other, or, according to others, on account of the uncommon size of his hands. He was the 8d son of *Xerxes I.*, and was brought to the Persian throne by the assassination of his father and elder brother *Darius* by *Artabanus* (465 B. C.), the captain of the guard. *Artaxerxes* nearly shared the same fate by the same hand, but the attempt being discovered, the dagger of the son avenged the double murder of his house, and saved his own life. Troubles in *Bactria*, excited by his elder brother *Hystaspes*, immediately engaged his attention. Meanwhile *Egypt*, which had been a Persian province ever since its reduction by *Cyrus* (535 B. C.), seized upon the favorable opportunity, and, for the 3d time, revolted against the Persian yoke. The aid afforded by the *Athenians* to *Egypt* rendered this struggle more severe and protracted than the former two. *Artaxerxes* at length compelled the *Athenians* to evacuate *Egypt*, leaving it then a matter of small difficulty to reduce it to subjection. The *Athenians*, however, once in arms, continued the struggle on their own account under *Cimon* with various success, until *Cimon* being suddenly out off by disease, a peace was concluded, having for its basis the virtual acknowledgment of the *Ionian* independence, and imposing humiliating restrictions on the naval movements of the *Persians*. The reign of *Artaxerxes* lasted for 39 years, when it was ended by his death (425 B. C.), and he was succeeded by his son *Xerxes II.* The reign of *Artaxerxes* is mostly filled with the exciting struggles of *Bactria* and *Egypt* above mentioned, but during such intervals of peace as were permitted to him, he gave his attention to the improvement of the political and social condition of his subjects. His memory is preserved in history as a prince of amiable manners, and noble and generous character. The Persian

dynasty was weakened rather than strengthened, however, in his reign. He refused, doubtless from politic considerations, to take any part in the Peloponnesian war, which was commenced during his reign, although solicited both by Athens and Sparta. Artaxerxes, on the authority of Josephus, the Septuagint, and the book of Esdras, is supposed to have been the Ahasuerus mentioned in Esther, who "reigned from India even into Ethiopia, over one hundred and seven and twenty provinces." II. ARTAXERXES, surnamed Mnemon, on account of his good memory, was eldest son of Darius II., and succeeded to the throne of his father 405 B. C. His younger brother Cyrus, governor of Asia Minor, claimed the throne, on the ground that he was the first-born of his father after his accession, and raised a revolt in his own favor. Artaxerxes quelled the revolt, took Cyrus prisoner, but spared him from death at the solicitation of his mother, and restored him to the procuratorship of Asia Minor. Cyrus, untouched by gratitude, raised a new conspiracy, which, under the command of Oecarchus, fought at Cunaxa, where both Cyrus and Oecarchus were slain, and from which point commenced the famous retreat, known in history as "the retreat of the Ten Thousand," and so Artaxerxes was put into quiet possession of the Persian throne (401 B. C.). (For a full account of this expedition of Cyrus, see the "Anabasis" of Xenophon.) This expedition, so disastrous to the conspiracy, was nevertheless the cause of a war which immediately after broke out between Persia and Lacedæmon. The position which the Lacedæmonians had assumed in the expedition by Cyrus was an abundant occasion for a renewal of hostilities on the part of Artaxerxes. Agesilaus, king of Lacedæmon, was placed by the ephori in command of the Spartan forces in Asia. At the most critical period of the expedition, just as Agesilaus, convinced of the internal weakness of the Persian dynasty, was preparing a descent upon the very heart of the empire, he was ordered home by the ephori to defend the country from a powerful league which had been formed through the intrigues of Artaxerxes with the Athenians, by appealing to their hatred of the Spartan influence among the Grecian states. This enabled Artaxerxes to give a successful issue to the war with Lacedæmon, ripened the combination of the Grecian states against Lacedæmon, and so hastened the decline of the Spartan power. Overwhelmed by these accumulated foes, Sparta consented to the humiliating peace of Antalcidas (387 B. C.), in which she resigned every thing at which the conspiracy of Cyrus had in the outset aimed, though the terms of the treaty were less disadvantageous to Sparta than to the other states. Evagoras, refusing his assent to the treaty which yielded up Cyprus to the Persian power, made a resistance of 10 years, and finally succumbed. Artaxerxes next prosecuted a war against the Cadusii, in person, and rendered them tributary. He next turned his forces against Egypt, but

failed through the unskilful management of his general, Pharnabazus. Twelve years later he renewed the attempt with the same result. He married 2 of his own daughters, and put to death his eldest son, having detected him in a conspiracy, and was succeeded at his death (which occurred 360 B. C., after a reign of 45 years) by his son Ochus. III. Ochus, on his accession, assumed the name of Artaxerxes. He was the 3d son of Artaxerxes II. He is remarkable in history for his cruelty and lack of principle. The principal event of his reign was the complete overthrow of the Egyptian power, and its subjugation to the Persian throne (354 B. C.). But it is recorded that he treated the Egyptian religion with such great disrespect in his triumph, that on his return into his own country he was assassinated by an Egyptian. This may not be true. The time of his death is generally set down 338 B. C.

ARTEDI, PETER, a Swedish physician, a contemporary and intimate of Linnæus, who bequeathed to him his literary property. He is known as a diligent writer on fossils and quadrupeds, and the works on these subjects, which he intended to publish, were completed by his friends, under the titles of *Bibliotheca Ichthyologica*, and *Philosophia Ichthyologica*. He was drowned at Leyden, 1785, in his 80th year.

ARTEMIDORUS OF EPHESUS, a Greek geographer who flourished partly in the 1st and partly in the 2d century B. C. He is said to have travelled in Iberia, and Gaul, to have circumnavigated the Mediterranean, and to have made voyages in the Red sea and the Indian ocean, that he might acquire a perfect knowledge of those countries and seas, and be able to correct the errors which former geographers had fallen into in describing them. The great work in which he embodied the fruits of his travels and observations consisted originally of 11 books. All of these have perished, save the fragments and extracts that Strabo, Marcion, and other ancient writers have preserved.

ARTEMIS, one of the superior divinities of the Greeks, corresponding with the Diana of the Romans. In Homer and Hesiod, she was the daughter of Zeus (Jupiter) and Leto (Latona), and the twin sister of Apollo, born with him at Delos. Like her brother, she is armed with a bow, quiver, and arrows, and sudden deaths of women are ascribed to her darts. In the Trojan war she sides with the Trojans, quarrels with Hera, who takes the bow from her back, and beats her with it. She is unmarried, and a paragon of chastity. She slays Orion with her arrows, and changes Actæon into a stag because he eepied her bathing. In conjunction with her brother, she slew the children of Niobe, who had deemed herself superior to Leto.—The Arcadian Artemis was a goddess of the nymphs. She hunts on the Taygetan mountains, and was drawn in a chariot by 4 stags, with golden antlers.—The Taurian Artemis was a goddess hostile to strangers, who demanded the sacrifice of

all such people as were thrown on the coast of Tauris. Iphigenia and Orestes brought her image to Greece with them. The Taurian Artemis was worshipped at Sparta. Boys scourged themselves at her altar, until it was covered with blood.—The Ephesian Artemia, commonly known as Diana of the Ephesians, was entirely oriental. Her priests were eunuchs, and she was represented as many breasted. Artemis was also identified with Selene, the moon, by the Greeks. She is represented as a huntress, tall, and nimble. Her hair is partly tied up, and partly flows down her back; the well-shaped legs are bare to the knees. Her attributes are the bow, quiver, and arrows, or a spear, and stag, on which she sometimes rides cross-legged, and hunting hounds.

ARTEMISIA, a queen of Halicarnassus, who was contemporary with Xerxes. As a vassal of the Persian crown, she joined the expedition of that monarch against Greece, with a squadron of 5 ships. Before the battle of Salamis she made herself conspicuous by the wisdom of her counsel, and in that battle she made herself still more conspicuous by her skill and valor. She became enamored of a young Abydæan named Dardanus, who did not reciprocate her affection. This so enraged her that she caused him to be seized, and had his eyes put out; but afterward regretting her cruelty, she consulted an oracle as to how she should make atonement for her crime, whereon the oracle commanded her to hasten to Leucas, and cast herself into the sea, which mandate she obeyed.—ARTEMISIA, the widow and successor of Mausolus, king of Caria, celebrated for the excessive grief which she manifested at his loss. She employed the most eloquent rhetoricians of Greece to pronounce panegyrics in his honor, and raised a magnificent monument to his memory at Halicarnassus. She is even said to have mingled the ashes of her idol with her wine, and to have made this beverage her daily drink, that she might the sooner die and meet him.

ARTEMISIUM, the name of several places in ancient geography. The most important of them is the northern coast and promontory of Eubœa, off which the Greek ships fought with the fleet of Xerxes, 480 B. C. The name is derived from a temple of Artemis, or Diana.

ARTEMON. I. A theologian who flourished about A. D. 220, and was the founder of a sect called the Artemonites, who held that Christ was a mere man, only better than other men by his superior virtues. The doctrine of the Artemonites was later revived by Paul of Samosata, and many others have taught it, from time to time, to the present day. II. A painter of some note near the time of Alexander the Great. III. A sculptor, who, according to Pliny, made statues for the palace of the Cæsars.

ARTERY. Arteries and veins are two orders of blood-vessels which unite in their peripheral extremities called capillary vessels, and also in the heart, which is their common cen-

tra. Arteries carry blood from the heart to every organ in the body, and veins bring back the blood from every organ to the heart.—There are two complete rounds of circulation in the human body, one termed pulmonary, and the other general or systemic. In one, the blood is carried from the heart into the lungs, to be there purified by the exhalation of carbonic acid gas, and the inhalation of pure air, and then returned to the heart for general circulation and nutrition. The pulmonary arteries, therefore, carry impure blood from the heart to the lungs, and the pulmonary veins return pure blood to the heart. In the general circulation this order is reversed; the arteries convey pure blood to all the organs, and the veins return dark, impure blood to the heart, to be again sent through the lungs for purification and regeneration.—Arteries and veins are somewhat different in structure. The walls of arteries are relatively strong and elastic, remaining firm, cylindrical, and open, when divided, while the walls of veins are thin, and easily collapse when empty. The walls of arteries are composed of 3 coats, the middle coat being very strong, the others membranous and less elastic.—The arteries pulsate in every part of the body, as the heart impels new volumes of blood through them at every pulsation. They terminate in minute capillary vessels, which supply the organs with new blood, and then pass into the veins to carry off the impure blood returned in exchange. The terminations of the arteries are termed arterial capillaries, and the beginnings of the veins, venous capillaries, the word capillary in both cases denoting the hair-like fineness of these minute vessels.—Blood is impelled through the arteries by the contractions of the heart, in the first instance, and by the natural elasticity of the arterial walls, as it proceeds; but in the veins the blood is forced onward by the pressure, and the movements of contiguous organs on the walls of the veins, and also by a partial vacuum and power of suction in the heart itself, produced by the alternate emptying and filling of the auricles and ventricles of either side. The movement of the blood within the veins is not so vigorous, however, and valves are placed in many parts to check the backward flow, which may at times arise from want of external pressure, or sufficient central and internal suction to carry it steadily forward. No valves exist in arteries, as no such backward flow occurs, except at the mouth of the aorta, where a temporary backward flow occurs, as the left ventricle expands to receive a new supply of blood from the left auricle above.—Arteries are subject to disease and dilatations which form pulsating tumors of a dangerous kind, technically called "aneurisma." The wounds of arteries are also very dangerous, from the rapidity with which the blood gushes from the wound. The proper modes of stopping hemorrhage from a wounded artery are pressure, twisting of the bleeding vessel, and ligature above the wound.

ARTESIAN WELLS. These are so named from the province of Artois in France, anciently called Artesium, in which they have for a long time been in use. They appear to have been known to the ancients, being occasionally alluded to by some of their writers. The Chinese also used them at an early period. Artesian wells are small holes sunk in the earth by boring, through which currents of water, struck at great depths, rise toward the surface, and sometimes flow over. Water thus pressed up must have its source in some more elevated lands, and be confined in the strata of rock, through which it has percolated; precisely as water is conveyed in pipes below the surface, and is pressed up into our houses to a height nearly equal to that at which the pipes commenced. Water finds its way down into the earth by flowing into the crevices and chasms of the rocks, and by percolating through the porous strata. In a region of limestone rocks it hollows out for itself its own bed, by dissolving the limestone, and even in this way produces great caves. The large streams that flow through these, and the innumerable little subterranean rivulets circulate between the layers of rock, seeking constantly lower levels. When forced by the pressure behind, they are pushed up through any apertures they meet, or that are opened for them, and flow out as springs or as artesian wells. To sink a well of this kind, therefore, with a reasonable prospect of bringing up a supply of water, it is essential that the spot selected should be of a lower level than other lands in the vicinity, though these higher lands may be several miles off. The strata of rock also should be inclined toward the lower level; for if the dip should be in the opposite direction, the probability is that the waters would find their way down the slope instead of across the layers. In almost all groups of stratified rocks, some of the strata are impermeable to water; down these the waters must flow as upon a tight floor. In a region of unstratified rocks, or where the strata are greatly disturbed, and lie in irregular positions, much uncertainty must attend the sinking of these wells. But by going to very great depths, wherever the surface is lower than that of the country around, there is a strong probability of striking water that has its source at a higher level. Underground currents are met with frequently at different depths, confined between different strata of rock, and having no connection with each other. If the first supplies struck do not rise to the desired height, the boring is continued in search of others below that will. It is sometimes the case that the head of water is at so high an elevation, that the column bursts forth from the ground as a fountain, throwing up a continual jet d'eau. The principle is precisely that of our artificial fountains. By raising the water above the surface in a pipe, and letting it flow over, convenient water-power is obtained. Artesian wells are applied to this purpose at many localities in

France, the quantity of water they supply being found sufficient to run heavy machinery.—These wells are particularly valuable in a region where water is difficult to be obtained. Upon arid plains and prairies on limestone formations through which the surface water soon finds its way and is lost, they are of great importance. The natives of some parts of the desert of Sahara have sunk them with success to the depth of 1,200 feet. Their successful introduction in the dry limestone region of Alabama, will no doubt be followed by their general use in similar localities throughout the western states.—From the great depth at which the currents of water are reached, their supplies may be regarded as permanent, provided so many wells are not sunk in the same neighborhood as to endanger exhausting the largest reservoirs. In the vicinity of London it is observed that the height to which the waters rise, diminishes as the number of the wells is increased. In 1838, the supply of water from them was estimated at 6,000,000 gallons daily, and in 1851 at nearly double the amount, and the average annual fall of the height of the water is about 2 feet. But in cases of single wells, the supply of water or the height to which it rises is seldom known to vary. One at Lillers (Pas de Calais) has been in steady operation since the year 1126. By their depth, also, the water brought up is warmer than that found near the surface. This increase of temperature with the depth takes place at different rates in different places. At Paris, where the mean temperature at the surface is $10^{\circ}.6$ C. = 51° F., the water of the artesian well of Grenelle is 82° F. from a depth of 1,797 feet, which is about 1° F. for every 58 feet deep. At St. Louis, the temperature of the water at 1,515 feet is $16^{\circ}.18$ F. higher than the mean temperature at the surface, making the increase 1° F. for every 83.8 feet descent. At Charleston, S. C., the temperature of the water at the surface is 68° F.; at 500 feet it is $73^{\circ}.5$ F.; at 1,000 feet, 84° ; and at 1,106 feet, 88° . The average rate of increase is about 1° F. for every $52\frac{1}{2}$ feet, as stated by Prof. Hume, of the state military academy.—The hot springs that flow out to the surface in many parts of the world, are natural artesian wells rising from great depths. In Virginia these springs are found along the lines of great faults or breaks in the stratification of the rocks, by which formations, usually separated by thousands of feet, are brought into contact with each other.—Warm waters obtained by artesian wells have been applied to useful purposes connected with manufacturing. They are especially valuable where pure water of a uniformly warm temperature is required. In Wurtemberg, large manufactories are warmed by the water being sent through them in metallic pipes. A constant temperature of 47° is thus maintained when the temperature without is at zero. Hospitals and greenhouses are also kept warm in the same manner.—The strata of clays, sands, and limestones, which form the

tertiary basins of London and Paris, are particularly well arranged for furnishing water by artesian wells. Covering areas of many square miles, the slope of the strata is toward the centre of the basin, and here, at the depth to which these reach, the waters must collect in large quantities. The strata, moreover, are not difficult to penetrate by boring. In these basins are concentrated the greatest number and the most expensive of these wells. That of Grenelle in the Paris basin is famous as the deepest among them. It was commenced in 1838 with the expectation of obtaining water at 1,200 or 1,500 feet, in the secondary green sand formation, which underlies the chalk—the uppermost member of this series. The boring was commenced with an auger of 1 foot diameter. At 500 feet it was reduced to 9 inches; at 1,100 feet to 7½ inches; and at 1,800 feet to 6 inches. Years passed as this work went slowly on under the direction of the government. By various accidents it was retarded for months at a time. At the depth of 1,254 feet, the tubing broke off, and fell with 270 feet of rods to the bottom of the hole. Fifteen months were spent in breaking these and extracting them in pieces. At 1,500 feet the government would have abandoned the enterprise, but for the urgent appeals of M. Arago. It was continued till, on Feb. 26, 1841, at the depth of 1,792 feet, the boring rod suddenly penetrated the arch of rock over the subterranean waters, and fell several yards. In a few hours the water rose to the surface in an immense volume, and with great violence, bringing up sand and mud. To check the supply, it has been found necessary to raise a vertical pipe many feet into the air, in which the water rises and flows over. Its temperature is uniformly 82° F. The extreme depth is 1,806 feet. The water is perfectly limpid, and flows at the rate of 500,000 gallons in 24 hours. This is the well that is made use of for warming the hospitals at Grenelle.—A deeper well than this was completed at Kissingen in Bavaria in 1850. It is 1,590 feet in sandstones, 150 in magnesian limestone (Zechstein), and 188½ in rock salt. At the depth of 1,878½ feet, the water burst forth in a column 4 inches in diameter, and rose 58 feet above the surface, spreading out like a palm tree at the top of the jet. Its temperature is 66° F., and it is charged with 8½ per cent. of pure salt, and discharges 100 cubic feet per minute. There are saline chalybeate springs in the vicinity, from which 500,000 bottles are annually exported; and it was for salt water that this well was sunk. Its whole cost has been £6,666. Another well at Münden, in Hanover, has reached a still greater depth; but the water rises to an elevation above the surface of only 15 feet, and is not so intensely salt.—Artesian wells sunk for bringing up salt water are common in the United States, especially in New York, Pennsylvania, and Virginia. The deepest well in this country, and it may be in the world, is that sunk at St. Louis by the Messrs. Belcher, for their sugar refinery. It

was commenced in the spring of 1849, 800 feet distant from the bank of the river, and 420 feet above the level of the sea, in the carboniferous limestone formation. An interesting account of its progress is given by A. Litton, M. D., in the "Transactions of the Academy of Science of St. Louis," vol. i, no. 1, 1857. The boring from the bottom of an open well 30 feet deep, was continued by hand power through 219 feet of calcareous strata, the diameter of the bore being 9 inches. In Sept. 1850, steam power was employed. In Sept. 1851, the bore was contracted at the depth of 457 feet to 8½ inches. In April, 1852, the sinking was stopped a few weeks to enlarge the bore of the first 80 feet to 16 inches, for the purpose of putting in a large pump and testing the water. The bore was then enlarged to 5½ inches, from the depth of 457 feet to 1,050 feet, and a 4-inch tube put in to hold up the shales of the last 150 feet. The sinking was then continued with a 3½-inch bore till March 12, 1854, when the depth of 2,199 feet was reached, and the work stopped in silicious and clayey beds belonging to the lower silurian formation. The strata penetrated were alternating limestones, shales, sandstones, with a few beds of chert rock and marls, which, by Dr. B. F. Shumard, of the state geological survey, are supposed to represent the Chemung group, the Hudson river slates, and the Black river and Trenton limestones. Below these, from 1,515 feet, is a stratum, about 100 feet thick, of a white soft sandstone, which appears to be the water-bearing stratum. This comes to the surface in the counties to the west and south of St. Louis, dipping toward the city. The water is discharged through a 20-inch pipe bolted to the rock, and flows over regularly at the rate of 75 gallons per minute. Its temperature is 73°.4 F. The mean temperature of the place being 55°.22 F., the increase to the depth of 1,515 feet is equal to 1° F. for every 88.8 feet of descent. The water proves to be unfit for other than medicinal purposes, having a strong odor of sulphuretted hydrogen, and a salty taste. Its specific gravity at 47° F. is 1.0068; and the composition of its solid constituents is thus given by Dr. Litton, 1,000 parts of the water yielding 8.791 of solid matter.

	In 1,000 parts.
Carbonate of protoxide of iron,0084
Carbonate of lime,1898
Carbonate of magnesia,0183
Chloride of calcium,4964
Chloride of magnesium,6944
Sulphate of lime,8156
Chloride of potassium,1808
Chloride of sodium,	6.2769
Silica,0094
Sulphuretted hydrogen,014056
Free carbonic acid,0550

The drills used in this work were of simple wedge-shape for soft rock, and four-square for hard rock. They screwed into an iron rod 80 feet long and 2½ inches in diameter, weighing about 600 lbs. This was screwed to a pair of slips, by which arrangement the drilling was effected by

the weight of the bar alone. The main rods were hickory poles made of 2 pieces, split and joined together; the lengths were about 80 feet each. They were suspended to a spring beam worked by a steam engine running 80 revolutions in a minute, and giving a stroke of 14 inches. The turning of the rods was done by hand. Four men were required to carry on the operation. The time actually spent upon the work was only 83 months; the whole cost is stated by Dr. Litton to have been not less than \$10,000; but by later authority it appears to have exceeded double this amount. It may with propriety be referred to as an example alike honorable to the proprietors and to the country itself, of a great undertaking being successfully carried to its termination by individual enterprise and perseverance, without government aid. Of all the wells sunk in the United States, none are so remarkable for the difficulties encountered and successfully overcome as that at Charleston, S. C. Since the year 1824, no less than 5 attempts have been made by the city government to obtain good water by this means. In 1848 the last operation was commenced under the direction of Maj. Welton, who had had much experience in sinking artesian wells in Alabama. The strata first penetrated were alluvial sands, saturated with water, which caused them to run as quicksand. These were shut out by cast-iron tubing of 6 inches diameter, which penetrated the clays and marls of the postpleiocene formation, and finally reached the depth of 280 feet, where it rested upon a rock of the eocene formation. From this point down, alternations of hard rock and loose sands were met with, the latter causing the same trouble as those above, running in and filling the well, sometimes even to the height of 140 feet up from the bottom in a single night. When it was found impossible to draw out the sands from these beds, the plan was adopted of shutting them out by tubing. The bore of the lower part being first enlarged from $8\frac{1}{2}$ to $5\frac{1}{2}$ inches, was lined with sheet-iron tubes to the depth of 700 feet. Sand flowing in at 1,020 feet rendered it necessary to take out the thin tubing, and replace it with heavier tubes of 4 inches diameter, and $\frac{7}{8}$ of an inch thick, which screwed one upon another; this was done to the depth of 1,102 feet. The sinking was extended, of 3 inch bore, to 1,250 feet, the last strata being sandstones, sand, and marls, probably of the cretaceous formation. The discharge, 10 feet above the surface, is about 1,200 gallons an hour. The water is saline, and disagreeable to the taste, but soft. Its temperature is 87° . It is used for steamboats, and the demand is such that another well, 30 feet distant, was commenced in February, 1858, which it is intended shall be carried down of 1 foot bore. This has already reached the depth of 950 feet. By the use of steam power the work is much more rapidly carried on than was that of the old well with horse power. The whole cost to the city, of both wells, has thus far been about \$35,000.—In New York city, artesian

wells were sunk years ago by Mr. Levi Disbrow, and the business has since been continued to the present time by his son, Mr. John Disbrow. The structure of the island is exceedingly unfavorable for very successful results to be expected from these enterprises, the strata being nearly vertical, and separated from all more elevated districts by deep salt water channels. The supply of fresh water likely to be met with below the surface cannot therefore be very large; nor can it, for want of sufficient head, rise to any great height in the wells. One of the oldest and deepest of these wells is at the United States hotel, known, when the well was sunk, as Holt's, between Pearl and Water streets. The boring for the first 126 feet was in stratified sands, and blue clay alternating with river mud. At this depth the surface of the rock was struck under a bed of coarse gravel; and below this the shaft was continued in the gneiss rock 500 feet farther. The upper 200 feet of the well was bored 3 inches in diameter; the remainder was $2\frac{1}{2}$ inches. The water for a time was tolerably good, but soon became impregnated with the salt river-water, until it was at last rendered unfit for use. At the corner of Bleeker street and Broadway, a well was sunk 448 feet, of 7 inches bore—the first 42 feet through sands and gravel, and 406 feet through the hard gneiss rock of the island. The water, as stated by Mr. Levi Disbrow, rose within 80 feet of the surface, and to the amount of 120,000 gallons in 24 hours. At the dry dock, 11th street, East river, the rock, met with at 180 feet, was penetrated 200 feet further. Many other wells of this nature have been sunk in and near the city, but with no features of particular interest.—The attention of the United States government has recently been directed to the subject of supplying water to the vast plain of Llano Estacado, by means of artesian wells. This plain, in the 32d parallel of latitude, lying between Arkansas and Missouri on the east, and Mexico and the Mesilla valley on the west, would, if supplied with water, afford a route to the extreme south-west, some hundreds of miles shorter than any other. It is covered with a hardy, nutritious species of grass, which the cold of winter cannot destroy, and thus pasturage for cattle through the whole year is furnished. In order to open this communication, the war department, in 1855, sent out a party under the direction of Capt. Pope, for the purpose of sinking artesian wells. His first encampment was upon the bank of the Pecos river, in the 32d parallel of latitude. At the distance of 15 miles due east from this point, he sunk the first well. The geological formation he found favorable for his work. The alternating strata of indurated clay and cretaceous marls were easily bored through, and yet were sufficiently hard to prevent the walls from falling in. At the depth of 360 feet, the first stream of water was struck, which rose to the height of 70 feet in the tubing. At the depth of 641 feet, the second

stream was struck, which rose 400 feet in the well. Five miles eastward from this point, in the succeeding year, he sunk a second well. Here he struck the same streams which he had before found, and at the depth of 860 feet he struck another which rose to the height of 750 feet in the tubing. Having experimented thus far, he was obliged to suspend his labors, as his materials were exhausted; but enough has been done to show the practicability of supplying water to this great plain by the method proposed, and it is to be hoped that at no distant day congress will make further appropriations, and that the work may be successfully completed. —There is a class of wells to which the name negative artesian wells, or drain wells, has been given, that are sunk to convey away surface waters into some absorbing stratum. They are of service particularly about manufactories, from which large quantities of impure liquids are discharged, the flow of which upon the surface might prove a nuisance. If there is reason for believing in the existence of any sandy stratum below the surface, or one of limestone, which usually abounds in fissures, a well of this kind may be sunk with reasonable prospect of its answering the desired purpose. —The process of sinking artesian wells is called boring. It is conducted by augers or drills attached to the end of an iron rod, and this connects by screws to another rod, and so on to any length required. To the upper end of the rod a transverse handle is attached, by which the instrument is partly turned round by 2 men at each time it is raised and dropped. The cutting edge of the auger or drill thus chips a fresh line across the bottom of the hole at each blow. The blow is given by the rod falling by its own weight after it is lifted a few inches. The lifting is done by the men at the handle assisted by another one at a higher elevation, who vibrates a long horizontal pole fastened at one end in a pile of stones, to the middle of which the rod is suspended by a chain. The vibration of this elastic pole lifts and drops the rod, and the workmen turn it by the transverse handle. As the rod becomes heavier with its increasing length, other contrivances are adopted for raising it; as by a windlass in the place of the pole, a rope being coiled round it, one end of which is held fast by a laborer as the windlass is turned, lifting the rod hung on the other end. By letting go the rope the coil unwinds, and the rod falls; another expedient is by cams attached to a windlass. But the weight of the rods becomes at last too heavy to be raised by men, and machines are contrived to be worked by horse power. At the well of Grenelle it required 8 horses to work the whim or machine for lifting out the rods. As the hole is carried down, it is necessary in most situations to protect its sides with tubes of wrought-iron. Sometimes tamping with clay answers the purpose near the surface. A set of these tubes is sent down one on another in lengths of about 6 feet, one screwing into

another, or attached together by a collar. If a second set should be required at a lower depth, it must be of a less diameter so as to go through the former, or this must be all drawn out with instruments prepared for this purpose, and the hole enlarged. The various kinds of instruments employed for sinking the hole, enlarging it, raising out the material as it accumulates, and for breaking up the instruments themselves, or the rods that may become detached and drop in, are too numerous and of too complicated forms to be described without drawings; and the same may be said of the various operations connected with the sinking of the holes. The well-known slow progress of the work is owing to the time required for drawing out the whole length of rods to discharge the ground-up fragments that collect in the bottom of the hole. This must be done with every few inches sunk, or even oftener than this; and as the work used to be conducted, it was necessary, after drawing out all the rods to which the drill was attached, to send them down again with a cylindrical spoon, gathering up the fine fragments. This was then lifted out, each length of rod unscrewed as it came up, and then the whole returned with the drill to recommence the sinking. The length of time consumed by occasional accidents has been already referred to in the account of the Grenelle well. An improved and more simple process has been introduced, taken from the Chinese, by whom it has been in practice from time immemorial. Their artesian wells are wonderful for their depth and numbers. The missionary Imbert stated, in 1827, that in the province of Ou Tong Kiao, in a district 10 leagues long and 4 leagues wide, these wells may be counted by "tens of thousands," sunk at very remote periods for the salt water and bituminous matters which come out with the waters. These products are met with at the depth of nearly 1,800 feet; and some of the wells that had lost them, have been carried down even to 3,000 feet. From this enormous depth currents of carburetted hydrogen come up in such quantity, that this is used by its combustion to furnish heat for evaporating the salt water. Instead of using rods to sink these wells, the Chinese suspend the cutting drill, which is attached to a heavy metallic rod 6 feet long and 4 inches in diameter, by a rope or chain which passes over a wheel. Around the drill is a cylindrical chamber, which, by means of simple valves, takes up and holds the broken fragments. As the rope is raised and dropped, it gives by its torsion a turn to the drill, causing it to vary its position at each stroke. When the cylinder requires to be discharged, it is easily wound out by a windlass or horse-whim. The rope is protected from wear by knobs of wood attached to it at intervals. This principle has been successfully applied in Germany to sinking holes for ventilating mines. With large drills 18 inches in diameter, a hole of this size has been carried down several hundred feet deep. It might also be well applied

to exploring for mineral veins and beds of coal, as is now sometimes done with the more expensive process. We have authentic accounts that in France by this new method an operator, M. Collet, contracts to sink wells in the chalk formation as deep as desired at 9 francs the running metre, which is 51 cents the foot. His apparatus costs only \$100. With the aid of 2 workmen he sinks at the rate of 25 to 35 feet a day in the chalk. He has already sunk near 100 wells, each of which has furnished pure water at an expense not exceeding \$60. With such results it may well be regarded as extraordinary that the old process still continues in general use. The objections to the process suggested by Burat, in his *Géologie Appliquée*, are that the rope is liable to break, that stones are liable to fall in and obstruct the operation, and that there is danger of the apparatus deviating in soft strata from a vertical course, thus rendering the tubing impracticable.

ARTEVELDE. I. JACQUES VAN, a citizen of Ghent in the 14th century, famous as a leader in the popular tumults of the time, and who became the absolute governor of Flanders, driving Count Louis of Orey into exile. He was of a very distinguished family, but caused himself to be enrolled in the guild of brewers in order to acquire popular influence. By his great riches, talents, and eloquence, he soon became a popular idol, and was chosen by 50 other corporations, beside the brewers, as their leader. He appears to have governed with despotic spirit, and according to Froissart, "he had in every town and castlewick through Flanders, sergeants and soldiers in his pay to execute his orders, and serve him as spies, to find out if any were inclined to rebel against him, and to give him information. At the same time he banished all the most powerful knights and esquires from Flanders, and such citizens from the principal towns as he thought were least favorable to the earl; seized one-half of their rents, giving the other moiety for the dower of their wives and support of their children." So formidable was the power of Artevelde, that his alliance became an object of great interest to Edward III. of England in his designs on France, and the protector, or *Buwaert*, as Artevelde was styled, became a most intimate friend of the monarch, who sent ambassadors to solicit his alliance. It was at Artevelde's instance that Edward added the French lilies to the royal arms of England, and styled himself in addition to his proper title, king of France; which assumptions were continued by the British sovereigns until the union with Ireland. The reason of this pretension on the part of Edward was doubtless to secure the allegiance of the Flemings, who had vowed not to make war against France. Their scruples were overcome, but the British invasion not being successful, Artevelde began to dread the vengeance of the count of Flanders. In order to secure the protection of England he endeavored to induce the people to expel the counts from the succession, and ac-

knowledge the Black prince, the son of Edward, as their sovereign. This excited a tumult which Artevelde in vain endeavored to pacify, and he was massacred in his own house in 1345, after 10 years of power. II. PHILIP VAN, the son of the preceding, was named in honor of Philippa of Hainault, queen of Edward III., who stood godmother at his baptism. In 1382, nearly 40 years after the death of his father, when war had again broken out between the men of Ghent and the count of Flanders, the people remembering the former services of Jacques van Artevelde, sought his son, carried him to the market-place, and by acclamation chose him *Buwaert* or governor. It is said that one of his earliest acts when in power was to revenge the death of his father, by putting to death 12 of the principal conspirators against him. He at once engaged vigorously in the war, and at the head of 5,000 men marched against Bruges, before which city he encountered the count of Flanders, and totally defeating his army, entered the place. He sent off to Ghent 500 of the principal citizens of Bruges as prisoners, and the count of Flanders himself escaped with great difficulty. The booty which fell to the men of Ghent proved of immense value, gold, silver, jewels, and precious stuffs being found in such quantities, that for a fortnight 200 carts were constantly occupied in transporting the pillage from Bruges to Ghent. All the towns in Flanders excepting Oudenarde submitted to Artevelde, who assumed the style of a sovereign prince, living on his return to Ghent with great magnificence, giving rich and costly banquets, and adding to his name the title of *Regard de Flandres*—the overlooker of Flanders. Among the articles with which Artevelde enriched the city was the golden dragon of Bruges, as large as an ox, which, for a long period afterward, surmounted the belfry of Ghent, and was said to have been brought from Constantinople by the Flemings, who followed the fortunes of Baldwin, count of Flanders, during the 4th crusade.—While besieging Oudenarde some of the men of Ghent having destroyed several towns on the frontier of France, the duke of Burgundy instigated Charles VI. of France to take up arms against Artevelde, and in favor of his vassal, the count of Flanders. Artevelde endeavored to propitiate the French monarch, but without success, and he then despatched ambassadors to England to solicit aid, and obtain the payment of 200,000 crowns, which Jacques, his father, had lent to Edward III. 40 years before. Failing in these requests, and several of his letters to the French sovereign having been treated with contempt, Artevelde prepared for war, while a French army under the command of Oliver de Olisson, the constable of France, marched for Flanders, the young king Charles VI. taking part in the expedition. Peter du Bois, one of Artevelde's commanders, was defeated by the French, who slew a large number of the Flemings, and the town of Ypres surrendered to

Charles without striking a blow. Finding that difficulties were thickening around him, Artevelde determined to risk a general action with the French, and encountered them Nov. 27, 1882, at Mont d'Or, near Ypres. He was totally defeated, slain after fighting bravely, and the army he had brought into the field was scattered, leaving 25,000 dead. The combat, styled the battle of Rosbecque, scarce lasted an hour. The body of Artevelde was found, and no wounds being discovered, his death was by some attributed to suffocation from the pressure of the throng during the flight, and after being stripped it was left suspended to a tree. The fortunes of Philip van Artevelde have formed the subject of an elegant dramatic poem, by Henry Taylor, of England.

ARTHRITIS (Gr. *ἄρθρις*, articulation or joint). This word is technically used to denote inflammation of the joints, of which there are 3 kinds, *i. e.* traumatic arthritis, rheumatic arthritis, and gouty inflammation of the joints. For the 2 latter varieties, see **RHEUMATISM** and **GOUT**. Traumatic arthritis is a frequent complication arising from wounds or bruises, contusions and surgical operations in or near the articulations. Acute inflammation of the articulation sometimes occurs also, without external cause, from the absorption of pus or morbid matter within the system. Women suffering from recent childbirth, or persons affected with phlebitis, blennorrhagia, or purulent infection, are liable to suffer from arthritis. Blows, falls, sprains, violent distension of the joint, fractures and wounds made by sharp instruments, may all produce acute inflammation in the joints.—All the parts of the joint may be involved, or some of the external or internal tissues only, for the intensity of the inflammation is much greater, when the capsule of the joint is lacerated and admits the air. During the first day or two, the case may seem very simple and without danger to the patient, but often on the third or the fourth day, or even later, the symptoms become more severe, and the pain excessive.—Traumatic arthritis is sometimes so severe as to derange the general health profoundly, causing delirium and convulsions; the skin is burning hot, the tongue is red, bile is vomited, and the patient suffers much from bodily pain and mental anxiety. Suppuration is the usual termination of this kind of inflammation. The prognosis is sometimes favorable, and sometimes not. When traumatic arthritis is superficial, it is easily cured; but when deeply seated and admitting air into the joint, it is a serious disease. In traumatic arthritis, the proper treatments consist of cloths and compresses steeped in cold water, and placed around the inflamed parts; gentle, passive movements of the joint; rest for the whole body, and particularly for the implicated limb; cooling diet, with appropriate sedatives and other medicines. Cupping and leeching are sometimes useful; and where suppuration has commenced, it is commonly more prudent to allow it to form its

own opening for evacuation, than to make an incision which may give rise to serious complications.

ARTHUR. The life and deeds of this ancient British hero, if indeed there ever was such a person, have been so involved in fiction, that it is not easy to give other than a mythological account of him. Nennius and Geoffroy, the most ancient Cymric poetry, the Triads, the poems of Llywarch Hen, and of Taliessin, speak of him as a prince and warrior, but not greatly superior to others of his contemporaries. His exploits occurred in the beginning of the 6th century. Nennius says that he gained 12 victories over the Saxons. Cerdic the Saxon was his great opponent, and his efforts were chiefly directed toward confining the Saxon within the then limits of Wessex. Modred, his nephew, revolted from him, which brought on the fatal battle of Camlan in Cornwall, in 542. Modred was slain, and Arthur mortally wounded. He was conveyed by sea to Glastonbury, where he was buried. Tradition preserved the place of his burial, and the tomb was opened by order of Henry II., in the 12th century. Giraldus Cambrensis, the historian, was present, and saw the bones and sword of the monarch, and a leaden cross let into his tombstone, with the inscription, in rude Roman letters, *Hic jacet sepultus inclitus rex Arturus in insula Avalonia*. The British Celts long believed that he would some day come back and lead them on again to drive the Sassenach into the sea, and vindicate for the Celtic race the undivided sovereignty of Britannia. The Arthur of romance is the son of Uther Pendragon, by Igerna, wife of Gorlois, duke of Cornwall, and owed his birth to a magical device, by which Uther, assuming the form of the lady's husband, obtained access to her. At the battle of Mount Badon he slew 470 Saxons with his good sword Caliburn and his lance Ron. He also drove the Scots and Picts back to their highland fastnesses. He destroyed the Pagan temples of the Saxons, and restored Christianity; the following year he conquered Ireland in a shorter time than Cromwell did, and not content with Erin, passed over to Iceland and annexed it. Then he spent 12 years in peace. Ten years more were occupied in conquests made in Norway and Gaul. Returning to Britain again, he held a great gathering at Caerleon, in Monmouthshire, where tributary kings in scores attended him. The Romans demanded tribute of him, and to chastise their insolence, like Dathi of Ireland, he rushed through Gaul impetuously, and was preparing to cross the Alps, when the revolt of his nephew Modred, who had allied himself with the Saxons, Scots, and Picts, recalled him. The story of his death in the romances is not different from that detailed above, as the nearest approach to historical verity. Britain, both north and south of the Tweed, abounds in memorials of Arthur; there are Arthur's Seat, Arthur's Round Table, Arthur's Castle, and the constellation (Telyn Arthur)

Arthur's harp. His name is most frequently found in Wales.

ARTHUR, RICHARD, a British vice-admiral, born 1778, died at Plymouth, Oct. 26, 1854. He was from his earliest youth connected with the naval service, and gradually rose from a captain's servant to the rank of a commander. This was conferred upon him in 1805, on occasion of his capturing 4 Spanish schooners in the gulf of Maracaibo, and on his cutting out another of the hostile boats from under the batteries of Santa Marta. During the Scheldt expedition of 1810, he gave another evidence of his courage by running in under the batteries of Dieppe, and attacking 7 lugger privateers, one of which he succeeded in bringing out. This daring exploit led to his promotion to post rank, and he was appointed vice-admiral in 1853.

ARTHUR, TIMOTHY SHAY, an American author, born near Newburg, in Orange county, N. Y., in 1809. He was about eight years of age when his parents removed to Baltimore, and his boyhood was passed with but few privileges of education. He was apprenticed to a trade, was for several years a clerk, and in 1833 visited the West as agent of a banking company. Meantime he had entered upon a course of reading and study, and upon his return to Baltimore became connected with a newspaper, and began to publish a series of short novels. His productions are numerous, consisting chiefly of works of fiction of a domestic character, written with a moral aim. They have been widely circulated in the newspapers and in cheap editions, and have been received with popular favor. For several years Mr. Arthur has also been actively engaged in the profession of journalism.

ARTHUR'S SEAT, a hill in the vicinity of Edinburgh, from the summit of which tradition says that King Arthur beheld the country, and near which he defeated the Saxons. The rocky point with which it terminates rises 822 feet 8 inches above high-water mark at Leith. From its peak the traveller may survey the centre of the kingdom, and obtain a complete view of Edinburgh, the whole forming a landscape hardly to be surpassed in Great Britain.

ARTHUR'S STONE, an enormous block of millstone on the summit of Cefu Bryn, a hill of Wales, Glamorganshire. It is 14 feet in length, and 7 feet in thickness, resting on 8 supporters, and is mentioned in the Welsh Triads as one of the 3 most stupendous works in Britain.

ARTICHOKE, (*cynara scolymus* and *cynara hortensis*), the green and globe artichokes of the gardens of Europe and America. They were known in the south of Europe as early as 1548. These plants resemble large thistles—the portion eaten is the under side of the head before the flower opens. The whole head is removed and boiled, the leaves laid aside and the bottom eaten, dipped in butter with a little pepper and salt. A sauce made of butter and spices is fre-

quently used. The French sometimes gather the heads when not larger round than a dollar, eat the lower end of the leaves raw, dipping them in oil, pepper, and vinegar. The globe variety is generally preferred by gardeners. Artichoke seed should be sown in a gentle hot bed, or warm open border as early in the spring as frost will permit. The plants should be set at a distance of 4 feet apart each way, in a stony soil, well prepared. They will bear heads the succeeding year. Some gardeners place 6 plants in a hill, making the hills 6 feet apart. Artichokes may be raised from sets or shoots which so often occur in old plants. They should be removed and carefully transplanted. As often as heads are removed from a plant it should be broken down to encourage the growth of new shoots. In autumn all plants should receive a good supply of earth or litter. Stable dung is too heating, and should never be employed. In the spring remove the autumn covering and take away all offsets except two or three of the best. During the first season the young plants of the previous year will produce heads from June till October. In succeeding years they will give heads from May until June or July. To have them the whole season, an annual plantation must be made. The flowers of the artichoke have the property of rennet in curdling milk. The French use the heads of the second crop of artichokes when dried, baked in meat pies with mushrooms. Artichoke heads are sometimes made to grow larger by tying a ligature tightly around the stem 3 inches below each.—The **JERUSALEM ARTICHOKE** (*helianthus tuberosus*, order *compositae*) is not a true artichoke, but the root of a species of sun flower. In Italian it is named *girasole*, or sun flower, and in English it is corrupted into Jerusalem. In America it is sometimes known as Canada potato and Virginia potato. It was well known in England as an edible root, about the year 1620, having found its way thither from Brazil. The tubers are good for swine and cattle, they are capable of resisting the severest degree of cold when left in the soil the whole winter; being lifted in spring they form excellent food for stock. The Jerusalem artichoke may be grown in all classes of soil, and when grown in light sands and gravels, swine are allowed to dig the tubers for themselves. It is difficult to eradicate this plant from the soil, and it is seldom entirely removed where once rooted in a rich soil. The tops cured in autumn form an excellent hay, yielding 5 or 6 tons per acre. Sandy soil of fair quality is said to yield from 1,200 to 1,500 bushels per acre. They are not quite as nutritious as the potato, containing 72.2 per cent. of water, being about 4 per cent. more than is contained in the potato. Thomas Noble, of Massillon, Ohio, planted artichoke tubers in drills 2½ to 3 feet apart, using a little more seed per acre than for potatoes—result 1,500 bushels per acre—fed to sheep. Tops cut and cured in October were preferred to corn fodder. Cordage is sometimes made out of the tops, and in

the south of Europe a kind of coarse cloth is manufactured from them. The farmers of America would do well to turn their attention to this root as a valuable adjunct to the feeding department of the farm.

ARTICLE, in grammar, the first part of speech. It is used before nouns, and makes them either definite or indefinite in their signification. In the English language *a* is the indefinite, *the* the definite article. There are traces in all languages which show that the article was originally a pronoun. The Greek and the German decline the article, in the 3 genders, and in all the cases; the Latin language does not use it at all. The Greek language has no indefinite article.

ARTICLES OF FAITH, concise statements of tenets held and promulgated by any religious body, assent to which is the condition of church fellowship. The Protestant church distinguishes the articles of faith into fundamental and non-fundamental (terms first used by Hunnius, 1626), making faith in the fundamental alone essential to salvation. Articles of faith are of progressive growth. It does not appear that the primitive churches made use of them. The apostle speaks of "the form of sound words," but it is not clear that he had reference to any known formulary of doctrine. That which in the church is now known as the Apostles' Creed, though it may be a perfectly correct statement of apostolic doctrine, appears not to have been referred to during the first 3 centuries of the church, as possessed of apostolic authority. As Christianity began to spread, and churches were organized with a wide geographical separation from each other, the personal labors of the apostles being now concluded, and the circulation of the Scriptures limited, formularies of faith became more or less necessary to keep up organization and intercourse. These were at first very brief, and far from being perfect digests of Christian doctrine. They gradually increased in definiteness, by collations and revisions. Thus the council of Nice (325) constructed a sort of eclectic creed from those which had already sprung up (as the Apostles', and that of Athanasius). So the councils of Constantinople (381) and Ephesus (431). The successive enlargement of creeds had been necessary to shut out heretics, who, on account of the advantages of church communion, would put their own construction on the laconic and unguarded forms in which the faith of the church had been at first expressed. When the reformation commenced (1517), the attempt was natural to express as pointedly as possible the fundamental differences between the reformers and the church; and when the church of England was organized, there was a new and more strenuous effort to express in concise, yet conciliatory language, the faith of a church which hoped to harmonize the opposing religious elements of the realm. The result was the 39 articles "for the avoydeing of the diversities of opinion, and the stablishing of con-

sent touching true religion, put forth by the queen's authority" (1562). These articles were chiefly drawn up by Oranmer and Ridley. All candidates for ordination must subscribe these articles. The general doctrine of the English church concerning the sense in which she requires subscription, was declared in the reign of James I., viz.: that "they should be taken in the literal and grammatical sense." An attempt was made to change the articles (1643), and give them a more Calvinistic form, and so a more pointed condemnation of Antinomianism. The articles of the Methodist Episcopal church have been constructed on the basis of the 39 articles, as well as those of many other ecclesiastical organizations of modern date. The English church has from time to time discussed the question whether the 39 articles are Calvinistic or Arminian in their theology, as also whether they teach the doctrine of baptismal regeneration. Among other articles of faith, though not specially so designated, may be mentioned the Augsburg confession, the Helvetic confession, that of the church of the Netherlands, consisting of 87 articles, and afterward made the basis of the symbol agreed upon by the synod of Dort. Articles of faith are by all Christian churches required to be either directly revealed in the Scriptures or in the church, or logically deducible from such revelations, in order to be binding. Other tenets may be held by individuals, but are not the basis of church organization.

ARTICULATA, the third great division of the animal kingdom, in the classification of Cuvier, and by him subdivided into 4 classes. Other naturalists have subsequently added 4 more, making the following 8 classes, of which the first 4 are those of Cuvier:

1. Annelida, as leeches, earthworms, &c.
2. Crustacea, as crabs, lobsters, prawn, shrimps, &c.
3. Arachnida, as spiders, scorpions, mites, &c.
4. Insecta, as beetles, flies, butterflies, &c.
5. Myriopoda, as centipedes.
6. Cirrhopoda, as barnacles and sea-anemones.
7. Rotifera, wheel-shaped animalcules, aquatic.
8. Entozoa—lowest of the worms—parasites upon or within other animals.

Each of these classes will be found treated under its own name. The articulata may properly be ranked, upon the whole, as higher in the animal scale than the mollusca, although, as in this division, some species may be found less highly organized than are some of the radiata, the 4th division of the series. For the articulata possess a high development of the locomotive organs, in which the mollusca are particularly deficient. The nervous system, also, is so organized that it presents a sufficient characteristic for designating the group; and the name *homogangliata* has been proposed by Prof. Owen as a substitute for that of *articulata*, this having reference only to the external conformation of the body in transverse rings, which may be of the soft skin, or integument, or else serve, in the form of a hard shell, as an external skeleton, to which the muscles are attached. This arrangement of the nerves is a chain of knots,

or ganglia, symmetrically disposed upon a double cord, which passes through the ventral region of the body, and from each ganglion nervous filaments pass off to the different segments of the body. A nervous ring from the anterior pair of ganglia encircles the œsophagus. Filaments connect this with the organs of the senses, and the œsophageal ganglia have hence been regarded as analogous to the brain in the higher orders. They are more and more concentrated as the animal occupies a more elevated position in the division, the members of the body being at the same time brought into closer connection. The symmetrical arrangement of the nerves suggests that of the members also; and the limbs are found arranged in pairs, in the centipedes each pair proceeding from one of the articulations of the body. In the higher classes, as the crustacea, the same symmetry of pairs of limbs is perceived, and the connection of each pair with a segment of the body even when the thorax, or body, needing no flexibility for locomotive purposes, has its rings very obscurely defined. The lower groups contain the greater number of articulations, or rings, and these are usually soft, upon an elongated body, furnished, in most cases, with no true limbs. Progressive motion is obtained by the bending of the flexible body in one and another direction, the muscles which effect this occupying a large portion of the body which in other animals is usually devoted more to the organs of nutrition and digestion. These, in the articulata, are not so elaborate as in the mollusca. The organs for respiration are much more highly organized, particularly in the insecta. In the air-breathing species the blood is aerated by being exposed to the action of the air introduced within the body, the fluid being distributed in cavities, or tubes, permeable to the air; the former appear to be analogous to lungs. In the articulata is found the greatest diversity of forms and habits of life. The largest animals of the division are the lobsters and crabs of the crustacea; the rest are, for the most part, of small size, many of them so minute as to pass unnoticed in the watery elements in which they abound. In the few representations of the classes enumerated above are recognized animals which live in salt water and in fresh water, others that sport upon wings in the air above the surface of the earth; some that burrow beneath and avoid the light of day, and others whose haunts are within the bodies of other animals. Among so many varieties every mode of progression is met with, by swimming, crawling, skipping, flying, &c., each peculiarly adapted to the circumstances in which the animal is placed, and altogether presenting, as before remarked, a high development of the locomotive organs; and if any class, like the cirrhopoda, appear to be badly provided for in this respect, the deficiency is found to be wonderfully made up to them by the faculty they possess of attaching themselves to floating bodies, and thus becoming, though fixed to these, the greatest of

all travellers, being carried to all parts of the earth, and suffering no detriment though they pass from the warm waters of the tropical seas into the icy currents of the polar regions.

ARTICULATION, a term in anatomy, denoting the various modes of union between the bones of the skeleton. We may class articulations under 8 general heads, viz., movable joints, immovable joints, and joints of a mixed order, being somewhat movable, without much relative displacement of the contiguous surfaces. Movable joints are the most complex and various in structure; immovable, the most simple. Movable joints are common in the limbs, and the articulation of the lower jaw with the skull; immovable joints are common in the head and face and lower portion of the trunk; mixed forms of articulation are common in the spinal column and the upper portions of the trunk. The hinge-joints of the elbows and the knees, allowing free movements in one plane only, form one order of the movable class; the ball-and-socket joints of the hip and shoulder, allowing free movements in a circular direction, form a second order of the movable class; and different combinations of these 2 orders, as seen in the articulations of the lower jaw with the skull, of the hands and feet with the arms and legs at the wrists and the ankles, and also of the bones of the hands and fingers, feet and toes, form a third order of the movable class. The elbow-joint, in fact, is of a compound order, being of the hinge-joint form, with reference to the cubital movement of the forearm on the arm, and of the ball-and-socket form, with reference to the radial movement of the forearm on the arm, in what are termed the supination and pronation of the hand and arm. The class of immovable joints may also be subdivided into different orders and varieties. In the sacrum and the pelvis many bones which are distinct at first, literally grow together, in some subjects, so as to efface all trace of original separation, while in others traces remain visible of former separation and ulterior consolidation. In the cranium and the face there are numerous varieties of modes of junction between different bones connected by immovable articulation. The most prominent order of this class in the cranium is the serrated suture, the firmness of the union being increased by alternate notches, or indentations, and projections, like the teeth of a saw, formed on the edges of the bones, the teeth of the one being adapted to the indentations of the other. In this manner the bones of the skull unite at the top of the head and in the centre of the forehead. In other cases bevelled edges overlap each other, and in this manner the temporal bones are joined to the parietal bones of the skull. Another form of fixed articulation is the ridge-and-groove, a ridge being formed on the edge of one bone and a grooved fissure in another to receive it. By this means the bony part of the septum of the nose is inserted into the floor of the nasal cavity to divide the nostrils, and thus form a double cavity

by means of a partition wall.—The mixed class of articulations contains very many varieties of adaptation. The mode in which the ribs are attached to the spinal column behind, and to the sternum in front, forms one simple order of the mixed class; the mode in which the vertebrae are connected with each other in the spinal column, another, more complex; and the mode in which the slightly yielding portions of the pelvic articulations are connected, a third and simple order of this class.—The movable articulations being the most complex in form and structure, will give the best idea of the various elements of an articulation; and the ball-and-socket joint, being the most simple of this kind, will serve the purpose of a simple illustration. In the hip-joint we have a kind of ball, or rounded surface, at the head of the thigh bone, which hemispherical surface is capped with a thin layer of cartilage, somewhat elastic in structure, and exceedingly smooth on its external surface. In the bones of the pelvis a socket is formed, exactly shaped for the reception of this hemispherical head of the thigh bone, and this socket is lined with a thin layer of dense, elastic, and polished cartilage, so that in the joint 2 polished surfaces meet together and allow free movement, with the least possible amount of friction, but to lessen the effect of friction, and facilitate the movements of these surfaces one upon the other, a delicate membrane surrounds the external borders of the articular cartilages, and secretes a viscid fluid which lubricates the surfaces, preventing actual contact and destructive friction of the cartilaginous tissues. This lubricating fluid is technically called synovia, and the secreting membrane synovial sac, or synovial membrane. To prevent dislocation of the joint a strong rope of fibrous tissue, very similar in structure to that part of an oyster which cannot easily be removed from the shell, connects the top of the ball with the bottom of the socket, in a somewhat loose but very strongly attached manner. This is termed the round ligament. It is very short and very strong. The outer surfaces of the ball and socket (not in the socket, but outside) are connected by means of a strong ligamentous band of fibrous tissue, loosely connecting the head of the thigh bone with the pelvic bones, on the outer rim of the socket, but strongly attached to the bones themselves, which it binds together firmly, while permitting a considerable freedom of motion, or rotation, in the joint. In other joints of the movable class the outer ligaments are not always continuous and circular bands as in this case, but take the form of distinct fibrous ropes, strongly attached to the bones, and forming strong, flexible bands, as strips of leather nailed to the body and the lid of a box serve as ligaments where there are no hinges. Thin, dense, elastic layers of cartilage cap the articular edges and surfaces of bones in the great majority of joints; strong, fibrous, and flexible ligaments connect the bones externally; and, where the joints are very mov-

able, synovial membranes surround the articulating surfaces, and the synovia which they secrete lubricates the surfaces exposed to contact, friction, and mobility.

ARTIFICIAL HORIZON, a horizontal mirror, usually the surface of a basin of mercury. Half the angular distance between a star and its image, seen in the artificial horizon, is evidently equal to the altitude of the star above the real horizon.

ARTIGAS, José, a South American general, born at Montevideo, in Uruguay, in 1760, died in November, 1825. During the insurrection of the Spanish colonies of South America, he held in his hands for a long time the fate of the new republic of Buenos Ayres. He was at first a captain in the Spanish army, but on account of some difficulty with a superior officer, passed in 1811 into the service of the junta of Buenos Ayres, and was intrusted with the command of a force with which he defeated the royalist army near Las Piedras. At the head of the *guachos*, as are called the native cattle drivers along the banks of the La Plata, he defeated the enemy in several encounters, and supported so vigorously the republican army which was pressing the siege of Montevideo, that his efforts procured an accommodation between the cabinet of Rio Janeiro and the government of Buenos Ayres. He, however, excited the jealous suspicions of Poeypredon, director of the junta, by whom he was declared outlawed, and a price set upon his head. But the *guachos* flocked again to the standard of their hero and of the champion of republicanism, in opposition to the centralized and monarchical government which it was the aim of Poeypredon to establish; and Artigas having defeated 2 armies which had been sent against him, obliged his enemies to cede to him the whole of Uruguay. He next carried his arms against the Portuguese, who had availed themselves of these dissensions to get possession of Montevideo, and forced them to negotiate. After various vicissitudes of fortune, supported by the whole democratic party, he made a conquest of Buenos Ayres in 1820. He found it difficult to support himself amid men of determined hostility and dangerous cunning, and, weary of the turmoils in which his life had been passed, he sought and found an asylum in a Franciscan convent; first, however, having disarmed and sent back to their rural labors the wild hordes of whom his army had been composed. In this religious retreat he terminated his stormy career a few years later. As a general, he was distinguished for his bravery and great activity. He exercised absolute authority over the *guachos*, whose mode of life he had entirely adopted. From the time of his elevation to power, he despised all the enjoyments and conveniences of civilized life. In his rude spirit there was a wonderful power of will which acted almost irresistibly upon the masses of men about him. The motives of much of his political conduct are yet veiled in mystery, and must be learned by a

perusal of the contemporary documents. At present he is but the shadowy though prominent feature of an obscure history.

ARTILLERY. The invention of gunpowder, and its application to throwing heavy bodies in a given direction, are now pretty generally conceded to have been of eastern origin. In China and India, saltpetre is the spontaneous excrecence of the soil, and, very naturally, the natives soon became acquainted with its properties. Fireworks made of mixtures of this salt with other combustible bodies were manufactured at a very early period in China, and used for purposes of war as well as for public festivities. We have no information at what time the peculiar composition of saltpetre, sulphur, and charcoal became known, the explosive quality of which has given it such an immense importance. According to some Chinese chronicles, mentioned by M. Paravey in a report made to the French academy in 1850, guns were known as early as 618 B. C.; in other ancient Chinese writings, fire-balls projected from bamboo tubes, and a sort of exploding shell, are described. At all events, the use of gunpowder and cannon for warlike purposes does not appear to have been properly developed in the earlier periods of Chinese history, as the first authenticated instance of their extensive application is of a date as late as 1282 of our era, when the Chinese, besieged by the Mongols in Kai-fang-fu, defended themselves with cannon throwing stone balls, and used explosive shells, petards, and other fireworks based upon gunpowder.—The Hindoos appear to have had some sort of warlike fireworks as early as the time of Alexander the Great, according to the evidence of the Greek writers Ælian, Otesias, Philostratus, and Themistius. This, however, certainly was not gunpowder, though saltpetre may have largely entered into its composition. In the Hindoo laws some sort of fire-arms appears to be alluded to; gunpowder is certainly mentioned in them, and, according to Prof. A. N. Wilson, its composition is described in old Hindoo medical works. The first mention of cannon, however, coincides pretty nearly with the oldest ascertained positive date of its occurrence in China. Chased's poems, about 1200, speak of fire-engines throwing balls, the whistling of which was heard at the distance of 10 oes (1,500 yards). About 1268 we read of fireworks on carriages belonging to the king of Delhi. A hundred years later the use of artillery was general in India; and when the Portuguese arrived there, in 1498, they found the Indians as far advanced in the use of fire-arms as they themselves were.—From the Chinese and Hindoos the Arabs received saltpetre and fireworks. Two of the Arabic names for saltpetre signify *China salt*, and *China snow*. Chinese red and white fire is mentioned by their ancient authors. Incendiary fireworks are also of a date almost contemporaneous with the great Arabic invasion of Asia and Africa. Not to mention the *marjanitz*, a somewhat mythical fire-arm said to have been known and used by Mohammed, it is certain that the Byzantine Greeks received the first knowledge of fireworks (afterward developed in the Greek fire) from their Arab enemies. A writer of the 9th century, Marcus Graecus, gives a composition of 6 parts of saltpetre, 2 of sulphur, 1 of coal, which comes very near to the correct composition of gunpowder. The latter is stated with sufficient exactness, and first of all European writers, by Roger Bacon, about 1216, in his *Liber de Nullitate Magia*, but yet for fully a hundred years the western nations remained ignorant of its use. The Arabs, however, appear to have soon improved upon the knowledge they received from the Chinese. According to Conde's history of the Moors in Spain, guns were used, 1116, in the siege of Saragossa, and a culverin of 4 lb. calibre, among other guns, was cast in Spain in 1182. Abdel-Mumen is reported to have taken Mohadia, near Bona, in Algeria, with fire-arms, in 1156, and the following year Niebla, in Spain, was defended against the Castilians with fire-machines throwing bolts and stones. If the nature of the engines used by the Arabs in the 12th century remains still to be investigated, it is quite certain that in 1380 artillery was used against Cordova, and that by the beginning of the 14th century its knowledge had passed from the Arabs to the Spaniards. Ferdinand IV. took Gibraltar by cannon in 1308. Baza in 1812 and 1828, Martos in 1326, Alicante in 1381, were attacked with artillery, and carcasses were thrown by guns in some of these sieges. From the Spaniards the use of artillery passed to the remaining European nations. The French, in the siege of Puy Guillaume in 1338, had guns, and in the same year the German knights in Prussia used them. By 1350, fire-arms were common in all countries of western, southern, and central Europe. That artillery is of eastern origin, is also proved by the manufacture of the oldest European ordnance. The gun was made of bars of wrought iron welded longitudinally together, and strengthened by heavy iron rings forced over them. It was composed of several pieces, the movable breech being fixed to the flight after loading. The oldest Chinese and Indian guns are made exactly in the same way, and they are as old, or older, than the oldest European guns. Both European and Asiatic cannon, about the 14th century, were of very inferior construction, showing artillery to have still been in its infancy. Thus, if it remains uncertain when the composition of gunpowder and its application to fire-arms were invented, we can at least fix the period when it first became an important engine in warfare; the very clumsiness of the guns of the 14th century, wherever they occur, proves their novelty as regular war-machines. The European guns of the 14th century were very unwieldy affairs. The large-calibred ones could only be moved by being taken to pieces, each piece forming a wagon-load. Even the

small-calibred guns were exceedingly heavy, there being then no proper proportion established between the weight of the gun and that of the shot, nor between the shot and the charge. When they were brought into position, a sort of timber framework or scaffolding was erected for each gun to be fired from. The town of Ghent had a gun which, with the framework, measured 50 feet in length. Gun-carriages were still unknown. The cannons were mostly fired at very high elevations, like our mortars, and consequently had very little effect until shells were introduced. The projectiles were generally round shot of stone, for small calibres sometimes iron bolts. Yet, with all these drawbacks, cannon was not only used in sieges and the defence of towns, but in the field also, and on board ships of war. As early as 1386 the English took 2 French vessels armed with cannon. If the guns recovered from the *Mary Rose* (sunk 1545) may serve as a clue, those first ship guns were simply let into and secured in a log of wood hollowed out for the purpose, so as to be incapable of elevation.—In the course of the 15th century, considerable improvements were made, both in the construction and application of artillery. Cannon began to be cast of iron, copper, or brass. The movable breech was falling into disuse, the whole gun being cast of a piece. The best foundries were in France and Germany. In France, too, the first attempts were made to bring up and place guns under cover during a siege. About 1450 a sort of trench was introduced, and shortly after the first breeching batteries were constructed by the brothers Bureau, with the aid of which the king of France, Charles VII., retook in one year all the places the English had taken from him. The greatest improvements were, however, made by Charles VIII. of France. He finally did away with the movable breech, cast his guns of brass and in one piece, introduced trunnions, and gun-carriages on wheels, and had none but iron shot. He also simplified the calibres, and took the lighter regularly into the field. Of these, the double cannon was placed on a 4-wheeled carriage drawn by 35 horses; the remainder had 2-wheeled carriages, the trails dragging on the ground, and were drawn by from 24 down to 2 horses. A body of gunners was attached to each, and the service so organized as to constitute the first distinct corps of field artillery; the lighter calibres were movable enough to shift about with the other troops during action, and even to keep up with the cavalry. It was this new arm which procured to Charles VIII. his surprising successes in Italy. The Italian ordnance was still moved by bullocks; the guns were still composed of several pieces, and had to be placed on their frames when the position was reached; they fired stone shot, and were altogether so clumsy that the French fired a gun oftener in an hour than the Italians could do in a day. The battle of Fornovo (1495), gained

by the French field artillery, spread terror over Italy, and the new arm was considered irresistible. Machiavelli's *Arte della Guerra* was written expressly, in order to indicate means to counteract its effect by the skilful disposition of the infantry and cavalry. The successors of Charles VIII., Louis XII. and Francis I., continued to improve and lighten their field artillery. Francis organized the ordnance as a distinct department, under a grand-master of the ordnance. His field-guns broke the hitherto invincible masses of the Swiss pikemen at Marignano, 1515, by rapidly moving from one flanking position to another, and thus they decided the battle. The Chinese and Arabs knew the use and manufacture of shells, and it is probable that from the latter this knowledge passed to the European nations. Still, the adoption of this projectile, and of the mortar from which it is now fired, did not take place in Europe before the second half of the 15th century, and is commonly ascribed to Pandolfo Malatesta, prince of Rimini. The first shells consisted of 2 hollow metal hemispheres screwed together, the art of casting them hollow was of later invention.—The emperor Charles V., was not behind his French rivals in the improvement of field-guns. He introduced limbers, thus turning the two-wheeled gun, when it had to be moved, into a 4-wheeled vehicle capable of going at a faster pace and of surmounting obstacles of ground. Thus his light guns, at the battle of Rémi in 1554, could advance at a gallop.—The first theoretical researches, respecting gunnery and the flight of projectiles, also fall in this period. Tartaglia, an Italian, is said to be the discoverer of the fact that the angle of elevation of 45° gives, *in vacuo*, the greatest range. The Spaniards Collado and Ufano also occupied themselves with similar inquiries. Thus the theoretical foundations for scientific gunnery were laid. About the same time Vannucci Birngoccio's inquiries into the art of casting (1540) produced considerable progress in the manufacture of cannon, while the invention of the calibre scale by Hartmann, by which every part of a gun was measured by its proportion to the diameter of bore, gave a certain standard for the construction of ordnance, and paved the way for the introduction of fixed theoretical principles, and of general experimental rules.—One of the first effects of the improved artillery was a total change in the art of fortification. Since the time of the Assyrian and Babylonian monarchies, that art had made but little progress. But now the new fire-arm everywhere made a breach on the masonry walls of the old system, and a new plan had to be invented. The defences had to be constructed so as to expose as little masonry as possible to the direct fire of the besieger, and to admit of a strong artillery being placed on the ramparts. The old masonry wall was replaced by an earthwork rampart, only faced with masonry, and the small flanking town was turned into a large pentagonal bastion. Gradually the whole of the masonry

used in fortification was covered against direct fire by outlying earthworks, and by the middle of the 17th century the defence of a fortified place became once more relatively stronger than the attack, until Vauban again gave the ascendant to the latter. Hitherto the operation of loading had been carried on with loose powder shovelled into the gun. About 1600 the introduction of cartridges, cloth bags containing the prescribed quantity of powder, much abridged the time necessary for loading, and insured greater precision of fire by greater equality of charge. Another important invention was made about the same time, that of grape-shot and case-shot. The construction of field-guns, adapted for throwing hollow shot, also belongs to this period. The numerous sieges occurring during the war of Spain against the Netherlands contributed very much to the improvement of the artillery used in the defence and attack of places, especially as regards the use of mortars and howitzers, of shells, carcasses, and red-hot shot, and the composition of fuzes and other military fireworks. The calibres in use in the beginning of the 17th century were still of all sizes, from the 48-pounder to the smallest falconets bored for balls of $\frac{1}{2}$ lb. weight. In spite of all improvements, field artillery was still so imperfect that all this variety of calibre was required to obtain something like the effect we now realize with a few middle-sized guns between the 6-pounder and the 12-pounder. The light calibres, at that time, had mobility, but no effect; the large calibres had effect, but no mobility; the intermediate ones had neither the one nor the other in a degree sufficient for all purposes. Consequently, all calibres were maintained, and jumbled together in one mass, each battery consisting generally of a regular assortment of cannon. The elevation was given to the piece by a quoin. The carriages were still clumsy, and a separate model was of course required for each calibre, so that it was next to impossible to take spare wheels and carriages into the field. The axletrees were of wood, and of a different size for each calibre. In addition to this, the dimensions of the cannon and carriages were not even the same for one single calibre, there being everywhere a great many pieces of old construction, and many differences of construction, in the several workshops of a country. Cartridges were still confined to guns in fortresses; in the field the cannon was loaded with loose powder, introduced on a shovel, upon which a wad and the shot were rammed down. Loose powder was equally worked down the touchhole, and the whole process was extremely slow. The gunners were not considered regular soldiers, but formed a guild of their own, recruiting themselves by apprentices, and sworn not to divulge the secrets and mysteries of their handicraft. When a war broke out, the belligerents took as many of them into their service as they could get, over and above their peace establishment. Each of these gunners or bombardiers received the com-

mand of a gun, had a saddle-horse, and apprentices, and as many professional assistants as he required, beside the requisite number of men for shifting heavy pieces. Their pay was fourfold that of a soldier. The horses of the artillery were contracted for when a war broke out; the contractor also found harness and drivers. In battle the guns were placed in a row in front of the line, and unlimbered; the horses were taken out of the shafts. When an advance was ordered, the limbers were horsed, and the guns limbered up; sometimes the lighter calibres were moved, for short distances, by men. The powder and shot were carried in separate carts; the limbers had not yet any boxes for ammunition. Manœuvring, loading, priming, pointing, and firing, were all operations of great slowness, according to our present notions, and the number of hits, with such imperfect machinery, and the almost total want of science in gunnery, must have been small indeed. The appearance of Gustavus Adolphus in Germany, during the 80 years' war, marks an immense progress in artillery. This great warrior did away with the extremely small calibres, which he replaced, first, by his so-called leather guns, light wrought-iron tubes covered with ropes and leather. These were intended to fire grape-shot only, which thus was first introduced into field warfare. Hitherto its use had been confined to the defence of the ditch in fortresses. Along with grape and case shot, he also introduced cartridges in his field artillery. The leather guns not proving very durable, were replaced by light cast-iron 4-pounders, 16 calibres long, weighing 6 cwt. with the carriage, and drawn by two horses. Two of these pieces were attached to each regiment of infantry. Thus the regimental artillery which was preserved in many armies up to the beginning of this century, arose by superseding the old small calibred, but comparatively clumsy guns, and was originally intended for case shot only, though very soon it was also made to fire round shot. The heavy guns were kept distinct, and formed into powerful batteries occupying favorable positions on the wings or in front of the centre of the army. Thus by the separation of the light from the heavy artillery, and by the formation of batteries, the tactics of field artillery were founded. It was General Torshanson, the inspector-general of the Swedish artillery, who mainly contributed to these results by which field artillery now first became an independent arm, subject to distinct rules of its own for its use in battle. Two further important inventions were made about this time: about 1650, that of the horizontal elevating screw, as it was used until Gribeauval's times, and about 1697, that of tubes filled with powder for priming, instead of working powder into the touchhole. Both pointing and loading became much facilitated thereby. Another great improvement was the invention of the prolonge, for manœuvring at short distances. The number of guns carried into the field during the 17th century,

was very large. At Graefenhagen, Gustavus Adolphus had 80 pieces with 20,000 men, and at Frankfort-on-the-Oder, 200 pieces with 18,000 men. Artillery trains of 100 to 200 guns were of very common occurrence during the wars of Louis XIV. At Malplaquet, nearly 800 pieces of cannon were employed on both sides; this was the largest mass of artillery hitherto brought together on a single field of battle. Mortars were very generally taken into the field about this time. The French still maintained their superiority in artillery. They were the first to do away with the old guild system and enrol the gunners as regular soldiers, forming, in 1671, a regiment of artillery, and regulating the various duties and ranks of the officers. Thus this branch of service was recognized as an independent arm, and the education of the officers and men was taken in hand by the state. An artillery school, for at least 50 years the only one in existence, was founded in France in 1690. A hand-book of artilleristic science, very good for the time, was published in 1697 by Saint Rémy. Still the secrecy surrounding the "mystery" of gunnery was so great that many improvements adopted in other countries were as yet unknown in France, and the construction and composition of every European artillery differed widely from any other. Thus the French had not yet adopted the howitzer, which had been invented in Holland and adopted in most armies before 1700. Limber boxes for ammunition, first introduced by Maurice of Nassau, were unknown in France, and indeed but little adopted. The gun, carriage, and limber were too heavy to admit of their being encumbered with the extra weight of ammunition. The very small calibres, up to 8 lbs. inclusive, had indeed been done away with, but the light regimental artillery was unknown in France. The charges used in the artillery of the times hitherto considered were, for guns, generally very heavy; originally equal in weight to the ball. Although the powder was of inferior quality, these charges were still far stronger in effect than those now in use, thus they were one of the chief causes of the tremendous weight of the cannon. To resist such charges the weight of a brass cannon was often from 250 to 400 times the weight of the shot. Gradually, however, the necessity of lightening the guns compelled a reduction of the charge, and about the beginning of the 18th century, the charge was generally only one-half the weight of the shot. For mortars and howitzers the charge was regulated by the distance, and generally very small. The end of the 17th and beginning of the 18th century was the period in which the artillery was in most countries finally incorporated in the army, deprived of its mediæval character of a guild, recognized as an arm, and thus enabled to take a more regular and rapid development. The consequence was an almost immediate and very marked progress. The irregularity and variety of calibres and models, the uncertainty of all

existing empirical rules, the total want of well-established principle, now became evident and unbearable. Accordingly, experiments were everywhere made on a large scale to ascertain the effects of calibres, the relations of the calibre to the charge and to the weight and length of the gun, the distribution of metal in the cannon, the ranges, the effects of recoil on the carriages, &c. Between 1780 and 1740, Bâllidor directed such experiments at La Fère in France, Robins in England, and Papacino d'Antoni at Turin. The result was a great simplification of the calibres, a better distribution of the metal of the gun, and a very general reduction of the charges, which were now between $\frac{1}{3}$ and $\frac{1}{2}$ the weight of the shot. The progress of scientific gunnery went side by side with these improvements. Galileo had originated the parabolic theory, Torricelli his pupil, Anderson, Newton, Blondel, Bernouilli, Wolff, and Euler, occupied themselves with further determining the flight of projectiles, the resistance of the air, and the causes of their deviations. The above-named experimental artillerists also contributed materially to the advancement of the mathematical portion of gunnery. Under Frederic the Great the Prussian field artillery was again considerably lightened. The short, light, regimental guns, not more than 14, 16, or 18 calibres long, and weighing from 80 to 150 times the weight of the shot, were found to have a sufficient range for the battles of those days, decided principally by infantry fire. Accordingly, the king had all his 12-pounders cast the same proportional length and weight. The Austrians, in 1758, followed this example, as well as most other states; but Frederic himself, in the latter part of his reign, again provided his reserve artillery with long powerful guns, his experience at Leuthen having convinced him of their superior effects. Frederic the Great introduced a new arm by mounting the gunners of some of his batteries, and thus creating horse artillery, destined to give the same support to cavalry as foot-artillery did to infantry. The new arm proved extremely effective, and was very soon adopted by most armies; some, as the Austrians, mounting the gunners in separate wagons as a substitute. The proportion of guns with the armies of the 18th century was still very large. Frederic the Great had, in 1756, with 70,000 men 206 guns, 1762 with 67,000 men 275 guns, 1778 with 180,000 men 811 guns. These guns, with the exception of the regimental ones which followed their battalions, were organized in batteries of various sizes from 6 to 20 guns each. The regimental guns advanced with the infantry, while the batteries were firing from chosen positions, and sometimes advanced to a second position, but here they generally awaited the issue of the battle; they left, as regards mobility, still very much to be desired, and at Kumsersdorf, the loss of the battle was due to the impossibility of bringing up the artillery in the decisive moment. The Prussian general, Tempelhof, also intro-

duced field-mortar batteries, the light mortars being carried on the backs of mules; but they were soon again abolished after their uselessness had been proved in the war of 1792 and '93. The scientific branch of artillery was, during this period, cultivated especially in Germany. Struensee and Toppelhof wrote useful works on the subject, but Scharnhorst was the leading artilleryman of his day. His hand-book of artillery is the first comprehensive really scientific treatise on the subject, while his hand-book for officers, published as early as 1787, contains the first scientific development of the tactics of field artillery. His works, though antiquated in many respects, are still classical. In the Austrian service, Gen. Vega, in the Spanish, Gen. Morla, in the Prussian, Hoyer and Rouvroy, made valuable contributions to artilleristic literature. The French had reorganized their artillery according to the system of Valière in 1782; they retained 24, 16, 12, 8, and 4-pounders, and adopted the 8-inch howitzer. Still there was a great variety of models of construction; the guns were from 22 to 26 calibres long, and weighed about 250 times as much as the corresponding shot. At length, in 1774, General Gribeauval, who had served with the Austrians in the '7 years' war, and who knew the superiority of the new Prussian and Austrian artilleries, carried the introduction of his new system. The siege artillery was definitively separated from the field artillery. It was formed of all guns heavier than 12-pounders, and of all the old heavy 12-pounder guns. The field artillery was composed of 12-pounder, 8-pounder, and 4-pounder guns, all 18 calibres long, weighing 180 times the weight of the shot, and of a 6-inch howitzer. The charge for the guns was definitely fixed at one-third the weight of the shot, the perpendicular elevating screw was introduced, and every part of a gun or carriage was made according to a fixed model, so as to be easily replaced from the stores. Seven models of wheels, and 8 models of axletrees, were sufficient for all the various vehicles used in the French artillery. Although the use of limber-boxes to carry a supply of ammunition was known to most artillerists, Gribeauval did not introduce them in France. The 4-pounders were distributed with the infantry, every battalion receiving 2 of them; the 8 and 12-pounders were distributed in separate batteries as reserve artillery, with a field-forge to every battery. Train and artisan companies were organized, and altogether this artillery of Gribeauval was the first corps of its kind established on a modern footing. It has proved superior to any of its day, in the proportions by which its constructions were regulated, in its material, and in its organization, and for many years it has served as a model. Thanks to Gribeauval's improvements, the French artillery, during the wars of the revolution, was superior to any other, and soon became, in the hands of Napoleon, an arm of hitherto unknown

power. There was no alteration made, except that the system of regimental guns was definitively done away with in 1799, and that with the immense number of 6-pounder and 8-pounder guns conquered in all parts of Europe, these calibres were also introduced in the service. The whole of the field artillery was organized into batteries of 6 pieces, among which one was generally a howitzer, and the remainder guns. But if there was little or no change in the material, there was an immense one in the tactics of artillery. Although the number of guns was somewhat diminished in consequence of the abolition of regimental pieces, the effect of artillery in a battle was heightened by its skilful use. Napoleon used a number of light guns, attached to the divisions of infantry, to engage battle, to make the enemy show his strength, &c., while the mass of the artillery was held in reserve, until the decisive point of attack was determined on; then enormous batteries were suddenly formed, all acting upon that point, and thus preparing by a tremendous cannonade the final attack of the infantry reserves. At Friedland 70 guns, at Wagram 100 guns, were thus formed in line; at Borodino, a battery of 80 guns prepared Ney's attack on Semenovka. On the other hand, the large masses of reserve cavalry formed by Napoleon, required for their support a corresponding force of horse artillery, which arm again received the fullest attention, and was very numerously represented in the French armies, where its proper tactical use was first practically established. Without Gribeauval's improvements, this new use of artillery would have been impossible, and with the necessity for the altered tactics, these improvements gradually, and with slight alterations, found their way into all continental armies.—The British artillery, about the beginning of the French revolutionary war, was exceedingly neglected, and much behind that of other nations. They had two regimental guns to each battalion, but no reserve artillery. The guns were horsed in single team, the drivers walking alongside with long whips. Horses and drivers were hired. The *matériel* was of very old-fashioned construction, and except for very short distances, the pieces could move at a walk only. Horse artillery was unknown. After 1800, however, when experience had shown the inadequacy of this system, the artillery was thoroughly reorganized by Major Spearman. The limbers were adapted for double team, the guns brigaded in batteries of 6 pieces, and in general those improvements were introduced which had been in use for some time already on the continent. No expense being spared, the British artillery soon was the neatest, most solidly, and most luxuriously equipped of its kind; great attention was paid to the newly erected corps of horse artillery, which soon distinguished itself by the boldness, rapidity, and precision of its manoeuvres. As to fresh improvements in the *matériel*, they were confined to the construction of

the vehicles; the block-tail gun-carriage, and the ammunition wagon with a limber to it have since been adopted in most countries of the continent.—The proportion of artillery to the other components of an army became a little more fixed during this period. The strongest proportion of artillery now present with an army was that of the Prussians at Pirmasens—7 guns for every 1,000 men. Napoleon considered 8 guns per 1,000 men quite sufficient, and this proportion has become a general rule. The number of rounds to accompany a gun was also fixed; at least 200 rounds per gun, of which $\frac{1}{4}$ or $\frac{1}{2}$ were case shot. During the peace following the downfall of Napoleon, the artilleries of all European powers underwent gradual improvements. The light calibres of 3 and 4 lbs. were everywhere abolished, the improved carriages and wagons of the English artillery were adopted in most countries. The charge was fixed almost everywhere at $\frac{1}{2}$, the metal of the gun at, or near, 150 times the weight of the shot, and the length of the piece at from 16 to 18 calibres. The French reorganized their artillery in 1827. The field-guns were fixed at 8 and 12 lb. calibre, 18 calibres long, charge $\frac{1}{2}$ weight of metal in gun 150 times that of the shot. The English carriages and wagons were adopted, and limber-boxes for the first time introduced into the French service. Two kinds of howitzers, of 15 and 16 centimetres of bore, were attached to the 8 and 12-pounder batteries, respectively. A great simplicity distinguishes this new system of field artillery. There are but 2 sizes of gun-carriages, 1 size of limber, 1 size of wheel, and 2 sizes of axletrees to all the vehicles used in the French field batteries. Beside this, a separate mountain artillery was introduced, carrying howitzers of 12 centimetres bore.—The English field artillery now has for its almost exclusive calibre the 9-pounders of 17 calibres long, weight $1\frac{1}{2}$ cwt. to 1 pound weight of shot, charge $\frac{1}{2}$ the weight of shot. In every battery there are 2 24-pounder $5\frac{1}{2}$ -inch howitzers. Six-pounder and 12-pounder guns were not sent out at all in the late Russian war. There are 2 sizes of wheels in use. In both the English and French foot artillery the gunners are mounted during manoeuvres on the limber and ammunition wagons.—The Prussian army carries 6 and 12-pounder guns, 18 calibres long, weighing 145 times, and charged with $\frac{1}{2}$ the weight of the shot. The howitzers are $5\frac{1}{2}$ and $6\frac{1}{2}$ -inch bore. There are 6 guns and 2 howitzers to a battery. There are 2 wheels and 2 axletrees, and 1 limber. The gun-carriages are of Gribbeauval construction. In the foot artillery, for quick manoeuvres, 5 gunners, sufficient to serve the gun, mount the limber-box and the off-horses; the remaining 3 follow as best they can. The ammunition wagons are not, therefore, attached to the guns, as in the French and British service, but form a column apart, and are kept out of range during action. The improved English ammunition wagon was adopted in 1842.

—The Austrian artillery has 6 and 12-pounder guns, 16 calibres long, weighing 185 times, charged with $\frac{1}{2}$ the weight of the shot. The howitzers are similar to those of the Prussian service. Six guns and 2 howitzers compose a battery.—The Russian artillery has 6 and 12-pounder guns, 18 calibres long, 150 times the weight of the shot, with a charge of $\frac{1}{2}$ its weight. The howitzers are 5 and 6-inch bore. According to the calibre and destination, either 8 or 12 pieces form a battery, one-half of which are guns, and the other half howitzers.—The Sardinian army has 8-pounder and 16-pounder guns, with a corresponding size of howitzer. The smaller German armies all have 6 and 12-pounders, the Spaniards 8 and 12-pounders, the Portuguese, Swedes, Danes, Belgians, Dutch, and Neapolitans 6 and 12-pounders.—The start given to the British artillery by Major Spearman's reorganization, along with the interest for further improvement thereby awakened in that service, and the wide range offered to artilleristic progress by the immense naval artillery of Great Britain, have contributed to many important inventions. The British compositions for fireworks, as well as their gunpowder, are superior to any other, and the precision of their time fuzes is unequalled. The principal invention latterly made in the British artillery are the shrapnel shells (hollow shot, filled with musket balls, and exploding during the flight), by which the effective range of grape has been rendered equal to that of round shot. The French, skilful as they are as constructors and organizers, are nearly the only army which has not yet adopted this new and terrible projectile; they have not been able to make out the fuze composition, upon which every thing depends.—A new system of field artillery has been proposed by Louis Napoleon, and appears to be in course of adoption in France. The whole of the 4 calibres of guns and howitzers now in use, to be superseded by a light 12-pounder gun, 15 $\frac{1}{2}$ calibres long, weighing 110 times, and charged with $\frac{1}{2}$ the weight of the solid shot. A shell of 12 centim. (the same now used in the mountain artillery), to be fired out of the same gun with a reduced charge, thus superseding howitzers for the special use of hollow shot. The experiments made in 4 artillery schools of France have been very successful, and it is said that these guns showed a marked superiority, in the Crimea, over the Russian guns, mostly 6-pounders. The English, however, maintain that their long 9-pounder is superior in range and precision to this new gun, and it is to be observed that they were the first to introduce, but very soon again to abandon, a light 12-pounder for a charge of $\frac{1}{2}$ the shot's weight, and which has evidently served Louis Napoleon as a model. The firing of shells from common guns is taken from the Prussian service, where, in sieges, the 24-pounders are made to fire shells for certain purposes. Nevertheless, the capabilities of Louis Napoleon's gun have still to be determined by experience,

and as nothing special has been published on its effects in the late war, we cannot here be expected finally to judge on its merits.—The laws and experimental maxims for propelling solid, hollow, or other projectiles, from cannon, the ascertained proportions of range, elevation, charge, the effects of windage and other causes of deviation, the probabilities of hitting the mark, and the various circumstances that may occur in warfare, constitute the science of gunnery. Though the fact, that a heavy body projected *in vacuo*, in a direction different from the vertical, will describe a parabola in its flight, forms the fundamental principle of this science, yet the resistance of the air, increasing as it does with the velocity of the moving body, alters very materially the application of the parabolic theory in gunnery practice. Thus for guns propelling their shot at an initial velocity of 1,400 to 1,700 feet in a second, the line of flight varies considerably from the theoretic parabola, so much so that with them, the greatest range is obtained at an elevation of only about 20 degrees, while according to the parabolic theory it should be at 45 degrees. Practical experiments have determined, with some degree of precision, these deviations, and thus fixed the proper elevations for each class of guns, for a given charge and range. But there are other circumstances affecting the flight of the shot. There is, first of all, the windage, or the difference by which the diameter of the shot must be less than that of the bore, to facilitate loading. It causes first an escape of the expanding gas during the explosion of the charge, in other words, a reduction of the force, and secondly an irregularity in the direction of the shot, causing deflections in a vertical, or horizontal sense. Then there is the unavoidable inequality in the weight of the charge, or in its condition at the moment it is used, the eccentricity of the shot, the centre of gravity not coinciding with the centre of the sphere, which causes deflections varying according to the relative position of the centres at the moment of firing, and many other causes producing irregularity of results under seemingly the same conditions of flight. For field-guns, we have seen that the charge of $\frac{1}{4}$ of the shot's weight, and a length of 16–18 calibres are almost universally adopted. With such charges, the point-blank range (the gun being laid horizontal), the shot will touch the ground at about 800 yards distance, and by elevating the gun, this range may be increased up to 3,000 or 4,000 yards. Such a range, however, leaves all probability of hitting the mark out of the question, and for actual and effective practice, the range of field-guns does not exceed 1,400 or 1,500 yards, at which distance scarcely 1 shot out of 6 or 8 might be expected to hit the mark. The decisive ranges, in which alone cannon can contribute to the issue of a battle, are, for round shot and shell, between 600 and 1,100 yards, and at these ranges the probability of striking the object is in-

deed far greater. Thus it is reckoned that at 700 yards about 50 per cent., at 900 yards about 35 per cent., at 1,100 yards 25 per cent. out of the shots fired from a 6-pounder, will hit a target representing the front of a battalion in column of attack (34 yards long by 2 yards high). The 9 and 12-pounder will give somewhat better results. In some experiments made in France in 1850, the 8-pounders and 12-pounders then in use gave the following results, against a target 30 metres by 8 metres (representing a troop of cavalry) at:—

	570 met.	600 met.	700 met.	870 met.	900 met.
12-p'ders, hits,	64 p.ct.	54 p.ct.	45 p.ct.	37 p.ct.	32 p.ct.
8-p'ders, " "	67 " "	44 " "	40 " "	23 " "	23 " "

Though the target was higher by one-half, the practice here remained below the average stated above. With field-howitzers the charge is considerably less in proportion to the weight of the projectile than with guns. The short length of the piece (7 to 10 calibres) and the necessity of firing it at great elevations, are the causes of this. The recoil from a howitzer fired under high elevation, acting downward as well as backward, would, if a heavy charge was used, strain the carriage so as to disable it after a few rounds. This is the reason why in most continental artilleries several charges are in use in the same field-howitzer, thus making the gunner to produce a given range by different combination of charge and elevation. Where this is not the case, as in the British artillery, the elevation taken is necessarily very low, and scarcely exceeding that of guns; the range-tables for the British 24-pounder howitzer, 2½-pound charge, do not extend beyond 1,050 yards, with 4° elevation; the same elevation, for the 9-pounder gun, giving a range of 1,400 yards. There is a peculiar short kind of howitzer in use in most German armies, which is capable of an elevation of from 16 to 20 degrees, thus acting somewhat like a mortar; its charge is, necessarily, but small; it has this advantage over the common, long howitzer, that its shells can be made to drop into covered positions, behind undulations of ground, &c. This advantage is, however, of a doubtful nature against movable objects like troops, though of great importance where the object covered from direct fire is immovable; and as to direct fire, these howitzers, from their shortness (16 to 7 calibres) and small charge, are all but useless. The charge, to obtain various ranges at an elevation fixed by the purpose intended (direct firing or shelling), necessarily varies very much; in the Prussian field artillery, where these howitzers are still used, not less than twelve different charges occur. Withal, the howitzer is but a very imperfect piece of cannon, and the sooner it is superseded by an effective field shell-gun, the better.—The heavy cannon used in fortresses, sieges, and naval armaments, are of various description. Up to the late Russian war, it was not customary to use in siege-warfare heavier guns than 24-pounders, or, at the very outside, a few 32-pounders. Since the siege of

Sebastopol, however, siege-guns and ship-guns are the same, or, rather, the effect of the heavy ship-guns in trenches and land-defences has proved so unexpectedly superior to that of the customary light siege-guns, that the war of sieges will henceforth have to be decided, in a great measure, by such heavy naval cannon. In both siege and naval artillery, there are generally found various models of guns for the same calibre. There are light and short guns, and there are long and heavy ones. Mobility being a minor consideration, guns for particular purposes are often made 22 to 25 calibres long, and some of these are, in consequence of this greater length, as precise as rifles in their practice. One of the best of this class of guns, is the Prussian brass 24-pounder of 10 feet 4 inches, or 22 calibres long, weighing 60 cwt.; for dismounting practice in a siege, there is no gun like it. For most purposes, however, a length of 16 to 20 calibres is found quite sufficient, and as, upon an average, size of calibre will be preferable to extreme precision, a mass of 60 cwt. of iron or gun-metal will be more usefully employed, as a rule, in a heavy 32-pounder of 16-17 calibres long. The new long iron 32-pounder, one of the finest guns in the British navy, 9 feet long, 50 cwt., measures but 16½ calibres. The long 68-pounder, 112 cwt., pivot-gun of all the large screw 181 gun-ships, measures 10 feet 10 inches, or a trifle more than 16 calibres; another kind of pivot-gun, the long 56-pounder of 98 cwt., measures 11 feet, or 17½ calibres. Still a great number of less effective guns enter into naval armaments even now, bored-up guns of merely 11 or 12 calibres, and carronades of 7-8 calibres long. There is, however, another kind of naval gun that was introduced about 85 years ago by General Paixhans, and has since received an immense importance, the shell-gun. This kind of ordnance has undergone considerable improvement, and the French shell-gun still comes nearest to that constructed by the inventor; it has retained the cylindrical chamber for the charge. In the English service the chamber is either a short frustum of a cone, reducing only very slightly the diameter of the bore, or there is no chamber at all; it measures in length from 10 to 13 calibres, and is intended for hollow shot exclusively; but the long 68-pdrs. and 56-pdrs. mentioned above throw solid shot and shell indiscriminately. In the U. S. navy Capt. Dahlgren has proposed a new system of shell-guns, consisting of short guns of very large calibre (11 and 9 inches bore), which has been partly adopted in the armament of several new frigates. The value of this system has still to be fixed by actual experience, which must determine whether the tremendous effect of such enormous shells can be obtained without the sacrifice of precision, which cannot but suffer from the great elevation required at long ranges. In sieges and naval gunnery, the charges are as variable as the constructions of the guns themselves, and the ends to be attained. In laying

a breach in masonry, the heaviest charges are used, and these amount, with some very heavy and solid guns, to one-half the weight of the shot. On the whole, however, one-fourth may be considered a full average charge for siege purposes, increased sometimes to one-third, diminished at others to one-sixth. On board ship, there are generally 3 classes of charges to each gun; the high charge, for distant practice, chasing, &c., the medium charge, for the average effective distances of naval engagements; the reduced, for close quarters and double shooting. For the long 32-pdrs. they are equal to $\frac{1}{6}$, $\frac{1}{4}$, and $\frac{1}{3}$ of the shot's weight. For short light guns and shell-guns, these proportions are of course still more reduced; but with the latter, too, the hollow shot does not reach the weight of the solid one. Beside guns and shell-guns, heavy howitzers and mortars enter into the composition of siege and naval artillery. Howitzers are short pieces intended to throw shell at an elevation up to 12 or 30 degrees, and to be fixed on carriages; mortars are still shorter pieces, fixed to blocks, intended to throw shell at an elevation generally exceeding 20 degrees, and increasing even to 60 degrees. Both are chambered ordnance; i. e. the chamber or part of the bore intended to receive the charge, is less in diameter than the flight or general bore. Howitzers are seldom of a calibre exceeding 8 inches, but mortars are bored up to 13, 15, and more inches. The flight of a shell from a mortar, from the smallness of the charge (1-20th to 1-40th of the weight of the shell), and from its considerable elevation, is less interfered with by the resistance of the air, and here the parabolic theory may be used in gunnery calculations without material deviation from practical results. Shells from mortars are intended to act either by bursting, and, as carcasses, setting fire to combustible objects by the jet of flame from the fuzes, or by their weight as well, in breaking through vaulted and otherwise secured roofs; in the latter case the higher elevation is preferred, giving the highest flight and greatest momentum of fall. Shells from howitzers are intended to act, first by impact, and afterward by bursting. From their great elevation, and the small initial velocity imparted to the shell, and consequent little resistance offered to it by the air, a mortar throws its projectile further than any other kind of ordnance, the object fired at being generally a whole town, there is little precision required; and thus it happens that the effective range of heavy mortars extends to 4,000 yards and upward, from which distance Sveaborg was bombarded by the Anglo-French mortar-boats.—The application of these different kinds of cannon, projectiles, and charges, during a siege, will be treated of under that head; the use of naval artillery constitutes nearly the whole fighting part of naval elementary tactics, and does therefore not belong to this subject; it thus only remains for us to make a few observations on the use and tactics of field artillery.—Artil-

lery has no arms for hand-to-hand fight; all its forces are concentrated in the distant effect of its fire. It is, moreover, in fighting condition as long only as it is in position; as soon as it limbers up, or attaches the prolonge for a movement, it is temporarily disabled. From both causes, it is the most defensive of all the 8 arms; its powers of attack are very limited indeed, for attack is onward movement, and its culminating point is the clash of steel against steel. The critical moment for artillery is therefore the advance, taking position, and getting ready for action under the enemy's fire. Its deployments into line, its preliminary movements, will have to be masked either by obstacles of ground or by lines of troops. It will thus gain a position parallel to the line it has to occupy, and then advance into position straight against the enemy, so as not to expose itself to a flanking fire. The choice of a position is a thing of the highest importance, both as regards the effect of the fire of a battery, and that of the enemy's fire upon it. To place his guns so that their effect on the enemy is as telling as possible, is the first important point; security from the enemy's fire the second. A good position must afford firm and level standing ground for the wheels and trails of the guns; if the wheels do not stand level, no good practice is possible; and if the trail digs into the ground, the carriage will soon be broken by the power of recoil. It must, beside, afford a free view of the ground held by the enemy, and admit of as much liberty of movement as possible. Finally, the ground in front, between the battery and the enemy, must be favorable to the effect of our arms, and unfavorable, if possible, to that of theirs. The most favorable ground is a firm and level one, affording the advantage of ricochet practice, and making the shot that go short strike the enemy after the first graze. It is wonderful what difference the nature of the ground will make in artillery practice. On soft ground the shot, on grazing, will deflect or make irregular rebounds, if they do not stick fast in it at once. The way the furrows run in ploughed land, makes a great difference, especially with canister and shrapnell firing; if they run crossways, most of the shot will bury themselves in them. If the ground be soft, undulating, or broken immediately in front of us, but level and hard further on toward the enemy, it will favor our practice, and protect us from him. Firing down or up inclinations of more than 5 degrees, or firing from the top of one hill to that of another, is very unfavorable. As to our safety from the enemy's fire, very small objects will increase that. A thin fence, scarcely hiding our position, a group of shrubs, or high corn, will prevent his taking correct aim. A small abrupt bank on which our guns are placed will catch the most dangerous of his projectiles. A dyke makes a capital parapet, but the best protection is the crest of a slight undulation of ground, behind which we draw our guns so far back that the enemy sees nothing

but the muzzles; in this position every shot striking the ground in front, will bound high over our heads. Still better is it, if we can cut out a stand for our guns into the crest, about 2 feet deep, flattening out to the rear with the slope, so as to command the whole of the external slope of the hill. The French under Napoleon were extremely skilful in placing their guns, and from them all other nations have learnt this art. Regarding the enemy, the position should be chosen so as to be free from flank or enfilading fire; regarding our own troops, it should not hamper their movements. The usual distance from gun to gun in line is 20 yards, but there is no necessity to adhere strictly to any of these rules of the parade-ground. Once in position, the limbers remain close behind their guns, while the wagons, in some services, remain under cover. Where the wagons are used for mounting the men, they too must run the chance of going into effective range. The battery directs its fire upon that portion of the enemy's forces which at the time most menaces our position; if our infantry is to attack, it fires upon either the opposing artillery, if that is yet to be silenced, or upon the masses of infantry if they expose themselves; but if a portion of the enemy advance to actual attack, that is the point to aim at, not minding the hostile artillery which fires on us. Our fire against artillery will be most effective when that artillery cannot reply, i. e. when it is limbering up, moving, or unlimbering. A few good shots cause great confusion in such moments. The old rule that artillery, excepting in pressing moments of importance, should not approach infantry to within 800 yards, or the range of small arms, will now soon be antiquated. With the increasing range of modern muskets, field artillery, to be effective, cannot any longer keep out of musket range; and a gun with its limber, horses, and gunners, forms a group quite large enough for skirmishers to fire at, at 600 yards with the Minié or Enfield rifle. The long-established idea, that who wishes to live long must enlist in the artillery, appears to be no longer true, for it is evident that skirmishing from a distance will in future be the most effective way of combating artillery; and where is the battle-field in which there could not be found capital cover for skirmishers within 600 yards from any possible artillery emplacement?—Against advancing lines or columns of infantry, artillery has thus far always had the advantage; a few effective rounds of grape, or a couple of solid shot plunging through a deep column, have a terribly cooling effect. The nearer the attack comes, the more effective becomes our practice; and even at the last moment we can easily withdraw our guns from an opponent of such slowness; though whether a line of *chasseurs de Vincennes*, advancing at the *pas gymnastique*, would not be down upon us before we had limbered up, must still remain doubtful.—Against cavalry, coolness gives the advantage to artillery. If the

latter reserve their grape to within 100 yards, and then give a well-aimed volley, the cavalry will be found pretty far off by the time the smoke has cleared away. At all events, to limber up and try to escape, would be the worst plan; for cavalry would be sure to overtake the guns.—Artillery against artillery, the ground, the calibre, the relative number of guns, and the use made thereof by the parties, will decide. It is, however, to be noticed, that though the large calibre has an undoubted advantage at long ranges, the smaller calibre approaches in its effects those of the large one as the ranges decrease, and at short distances almost equals them. At Borodino, Napoleon's artillery consisted principally of 3 and 4-pounders, while the Russians exulted in their numerous 12-pounders; yet the French small pop-guns had decidedly the best of it.—In supporting either infantry or cavalry, the artillery will have always to gain a position on its flank. If the infantry advances, it advances by half-batteries or sections on a line with the skirmishers, or rather in advance of it; as soon as the infantry masses prepare to attack with the bayonet, it trots up to 400 yards from the enemy, and prepares the charge by a rapid fire of case shot. If the attack is repelled, the artillery will re-open its fire on the pursuing enemy until compelled to withdraw; but if the attack succeeds, its fire contributes a great deal to the completion of the success, one-half of the guns firing while the other advances. Horse artillery, as a supporting arm to cavalry, imparting to it some of that defensive element which it naturally lacks altogether, is now one of the most favorite branches of all services, and brought to high perfection in all European armies. Though intended to act on cavalry ground, and in company with cavalry, there is no horse artillery in the world which would not be prepared to gallop across a country where its own cavalry would not follow without sacrificing its order and cohesion. The horse artillery of every country forms the boldest and skilfullest riders of its army, and they will take a particular pride, on any grand field-day, in dashing across obstacles, guns and all, before which the cavalry will stop. The tactics of horse artillery consist in boldness and coolness. Rapidity, suddenness of appearance, quickness of fire, readiness to move off at a moment's notice, and to take that road which is too difficult for the cavalry, these are the chief qualities of a good horse artillery. Choice of position there is but little in this constant change of places; every position is good so as it is close to the enemy and out of the way of the cavalry; and it is during the ebbing and flowing of cavalry engagements, that the artillery, skirting the advancing and receding waves, has to show every moment its superior horsemanship and presence of mind in getting clear of this surging sea across all sorts of ground where not every cavalry dares, or likes to follow.—In the attack and defence of posts, the tactics of artillery are similar. The principal

thing is always to fire upon that point from which, in defence, threatens the nearest and most direct danger, or in attack, from which our advance can be most effectually checked. The destruction of material obstacles also forms part of its duties, and here the various calibres and kinds of ordnance are applied according to their nature and effect; howitzers for setting fire to houses, heavy guns to batter down gates, walls, and barricades.—All these remarks apply to the artillery which in every army is attached to the divisions. But the grandest results are obtained by the reserve artillery in great and decisive battles. Held back out of sight and out of range during the greater part of the day, it is brought forward in a mass upon the decisive point as soon as the time for the final effort has come. Formed in a crescent a mile or more in extent, it concentrates its destructive fire upon a comparatively small point. Unless an equivalent force of guns is there to meet it, half an hour's rapid firing settles the matter. The enemy begins to wither under the hailstorm of howling shot; the intact reserves of infantry advance—a last, sharp, short struggle, and the victory is won. Thus did Napoleon prepare Macdonald's advance at Wagram, and resistance was broken before the 3 divisions advancing in a column had fired a shot or crossed a bayonet. And since those great days only can the tactics of field artillery be said to exist. (See also CANNON.)

ARTNER, MARIA THERESA VON, a German poetess, born at Schnitau, Hungary, April 19, 1772, died at Agram, Nov. 25, 1829. After the death of her father, who occupied a high position in the Austrian army, she resided for a time at Vienna. While at Vienna, she figured in society as a sort of Madame de Staël on a small scale. She was a lady of great intensity of feeling, and her poetical works are more remarkable for emotional power and poetic sentimentality than for intellectual force or artistic taste.

ARTOIS, once a province of France, now part of the department of Pas-de-Calais. Arras was its capital. Artesian wells derive their name from Artois. In the 8th century it was invaded by the Vandals, and subsequently by the Franks, who ruled over it till A. D. 863.

ARTOT, JOSEPH, a celebrated Belgian violinist, born at Brussels in 1815, died at Paris, July 20, 1845. When a mere child, he was able to execute very difficult pieces on the violin. In the *Conservatoire* at Paris, he won, at the age of 18, the first prize for violin playing. After travelling all over Europe with marked success, he associated himself in 1843 with M^{me} Damoreau, a gifted French singer, and they embarked for the United States, where they met with a flattering reception. Although Ole Bull and Vieuxtemps were in America at that time, Artot had his full share of success. His personal appearance made a favorable impression, while the neatness, elegance, and purity of his execution, and especially the melancholy senti-

ment which he imparted to music, secured for him the sympathy of the fairer sex, as well as the golden opinions of the critics. On his return to Europe, his health, which had always been feeble, failed rapidly, and he died at the age of 80.

ARTOTYRITES (Gr. *apros*, bread, *rupos*, cheese), a sect of the Montanists who flourished in the 2d century. They communed with bread and cheese, instead of bread and wine; hence their name.

ARTS, THE FINE. See **ART**.

ARTS, DEGREES IN. The degrees of bachelor of arts, *baccalaureus artium* (B. A. or A. B.), and *artium magister*, master of arts (A. M. or M. A.), are university degrees conferred under that name in Great Britain and America. The origin of these degrees is undoubtedly Italian and French. In modern France the first degree corresponding to the bachelor of arts, is *bachelier des lettres*, and the second corresponding to the master of arts is *licencié*. Previous to the institution of universities in the 11th and 12th centuries, the only academical distinction was the simple one of master and pupil. It should be said, however, that Cazenius II., by the 84th canon of a council held at Rome A. D. 826, mentions the appointment of *magistri* and *doctores*. They were synonymous terms, and this has been held by some to mean masters of arts and doctors of divinity; but the better opinion is that these *magistri* and *doctores* were only pedagogues. The whole number of arts taught in the universities of the middle ages was 7, namely, the *trivium*, consisting of grammar, logic, and rhetoric, and the *quadrivium*, comprehending music, arithmetic, geometry, astronomy. These are the original *artes*, whence our modern British and American graduates derive their titles. *Artiductor* and *artista* are ancient names for masters of arts. In the university of Paris the first degree conferred was that of *artista*. Gregory IX., who occupied the papal throne from 1227 to 1241, first instituted the inferior order of bachelors, about the derivation of which name the best opinion is that it comes from *bacilla* (little staves), either because the scholars were admitted to their degree by receiving a little staff, or because they were likened to the raw recruits for the militia who were called *bacillarii*, because they practiced with sticks in order to gain a knowledge of the use of the steel weapon. There is no doubt that both of these degrees of arts were conferred at Oxford, in their present form, in the time of Henry III., in the middle of the 13th century. Wood, in his "History and Antiquities of the University of Oxford," quotes the commentary of a certain Whetley upon Boëthius, written in the time of Edward I.: "When the said bachelor was created master, the chancellor gave him the badges with very great solemnity, and admitted him into the fraternity with a kiss on his left cheek, using these words: *En tibi insignia honoris tui, en librum, en cucullum, en pileum, en denique amoris mei*

pignus, oculus; in nomine Patrie et Filii et Spiritus Sancti. In the British and American universities, speaking generally, a course of 3 or 4 years at the university and the undergoing an examination, are required as conditions precedent to the degree of bachelor of arts. The degree of master of arts is conceded without any further examination; an interval of 2, 3, or 4 years only being required, and the payment of a fee. In Great Britain bachelors of arts generally take their master's degree, but in America, owing probably to the smaller amount of consideration paid to merely nominal distinctions, this formality is more neglected than made use of.

ARUNDEL, BLANCHE, the daughter of Lord Worcester, and countess of Arundel, died in 1669, aged 66. With only 25 men she defended Windsor castle against 1,300 of the parliamentary troops, and finally made an honorable surrender, the conditions of which were disgracefully broken by the victors. Her tomb is in the chapel of the castle.

ARUNDELIAN MARBLES. These marbles derive their name from Thomas, earl of Arundel, under whose auspices they were discovered by William Petty. They are also called Parian marbles, after the town of Paros, where they were supposed to have been found, and are occasionally referred to as Oxford marbles, from the fact that in 1667 the collection was presented to the university of Oxford. This collection, consisting of ancient statues, busts, mutilated figures, altars, sarcophagi, &c., arrived in England in 1627. They are described with great accuracy in Böckh's *Corpus inscriptionum Græcarum* (Berlin, 1848). The most interesting relic of antiquity included in this collection is the celebrated inscription called the Parian Chronicle, or *Marmor Chronicon*, a long, oblong slab of marble, on which was engraved, in capital letters, a chronological account of the principal events in Greece, and particularly Athenian history, from Cærops, 1582 B. C., to the archonship of Diognetus in 264. In the times of Charles I. the marbles suffered much injury, especially the chronological marble. The authenticity of the Parian Chronicle has been called in question by the Rev. I. Robertson, in his dissertation on the subject, published in 1788, and by others, but has been vindicated by many of the most learned men, particularly by Professor Porson.

ARUNS, an Etrurian name for the younger sons of royal or noble houses, while the elder was named Lucarno.

ARUSINI CAMPI, the Arusian fields, the scene of the last engagement between Pyrrhus and the Romans, were probably a tract of plain country, beginning within 2 miles of the city of Beneventum, lying along the river Calor, and traversed by the Appian way. They have been placed by some writers in Lucania, but the best authorities agree in placing the scene of the action near Beneventum.

ARVIRAGUS, a British king who reigned about A. D. 90. He was victorious over Claudius, but soon after treated with the Roman empire, being hard pressed in the siege of Winchester. He afterward married the emperor's daughter.

ARWIDSSON, ADOLF IWAR, a distinguished scholar of Finland, born 1791, at Padasjoki, in the government Tavestehus, where his father held a high position in the church. In 1817 we find Adolf teaching history in the university of Åbo, which he had previously attended as student. In 1821 he established the *Morgonbladet*, a journal devoted to literature and politics, but the liberal sentiments advanced therein gave umbrage to the Russian government. Not only was the paper stopped, but at the beginning of 1822, the unlucky editor, in consequence of an article contributed by him to another paper (the *Mnemosyne*), was deprived of his position in the university of Åbo, and expelled from the country. He betook himself to Stockholm, where he found not only a cordial reception, but an excellent appointment as librarian of the royal library, which he still holds. At the same time he acts as secretary of the Swedish printers' association, and as editor of its journal, which presents a complete and faithful record of the contemporary literary movements in Sweden. One of the most interesting labors performed by him at the Stockholm library is in connection with a catalogue of Icelandic manuscripts published by him in 1848. A valuable addition to the information about Finland is found in Rüh's work on the subject, which was translated into German by Arwidsson, an edition of the *Opera Omnia* of Calenius was brought out under his auspices, and Swedish literature is especially indebted to him for an admirable collection of songs (*Svenska Fornsänger*), current among the people in the times of Swedish antiquity. They were compiled by him from Rååf's collection, and form an interesting addition to the general literary gallery of Swedish poetry edited by Geijer and Afzelius.—**TAULA**, a Swedish engraver, born at Westervik, in South Sweden, toward 1660, died in 1705. He was a graduate of the university of Upsal, and engaged in his art at one of the museums of that city, when he suddenly removed to Stockholm in company with a beautiful nun, whom he had made his wife, but who died soon afterward. He sought consolation in the study of the Hebrew and other oriental languages, and a curious evidence of his industry is found in his engraving illustrative of the first of the 7 penitential psalms. This work appeared in the same year in which he died.

ARYA, ARYANA, in ancient Persian, **HARIVA**, in the modern, **HEBI**, a name given to various Asiatic countries. In the most general and extensive signification in the remotest antiquity, Arya was the denomination of a great part of western and south-western Asia. In the Sanscrit law of Menu, it comprised the territory between the Ganges and the Indus, the low-

lands of the Indus between the Himalayas or Hindoo Kooch and the Vindhyan, and the country in the mountains at the north, called in Sanscrit Arya-Varta, the land of the brave, which was the cradle of the primitive Aryans. The name of Arya transmitted through thousands of years, was retained by the region between the ancient Parapomus or Hindoo Kooch, the right bank of the Indus and the Medo-Persian territory, in all of which the Sanscrit was spoken. Another Arya, where the Zend was spoken, and according to the original text in the Zend called Haroion or Haroyu, the mother of peoples, was, as says the Zend tradition, the 6th Eden created by Ormuzd for his migratory children. In Persian and Macedonian times this Aria comprised Sogdiana, Hyrcania, and Arachosia. The region composing Iran, or Persia, is often called Arya. Some ancient writers mention an Arya, Aryana, in the remote western corner of the Caspian sea, and another on its eastern shores. In Thibet, likewise, the name Arrhia, or Arrhya, was used for a portion of the country. Arya proper, as laid down on the maps, was bounded N. by Bactria, S. by Drangiana, E. by the Hindoo Kooch, W. by the desert of Karamania and the Persian or Salt sea. It is a barren land, with a few fertile strips, in the valleys and along the banks of rivers. Its capital now, as in remote antiquity, is Herat, the ancient Artakoana, north of the lake of Arya, now called Zurra.—In the theory recognizing the tablelands of central Asia, in Thibet, north of the Himalayas, as the cradle of the races which peopled the greatest part of the globe, the Aryans correspond to the Japhetians, descendants of Japhet, in the Book of Genesis, and still more to what in modern times is called the Caucasian race. This primitive stock probably dwelt originally around the sources of the Oxus and the Jaxartes. Thence they migrated in various directions: some toward the north-west and Europe, others toward the south-west into Sogdiana and into the southern slopes and gorges of the Hindoo Kooch. To this northern locality, as to the primitive home of the Aryans, the Sanscrit and Zend religious and historical traditions all point. Thence the Aryans extended west and south. In the remotest times, the eastern Hindoos called themselves Aryans; but the Hindoos south of the Himalayas and along the Indus preserved that name to a later period. In the broad sense, all the inhabitants of south-western and western Asia, not of Semitic or Cushitic stock, including the Medes, were Aryans. The Aryans were divided into those speaking the Sanscrit and those speaking the Zend. It seems that in the most remote times a race from which the Afghans are descended, interposed itself between the 2 branches of the Aryans. The Zend branch descended west as well as south, as a conquering people, subduing or overthrowing, in western Asia and along the Indus, the Semitic and Cushitic empires, their theogonies and civilizations. Aryi, Aratti, is a name given by the eastern

Hindooes to the north-western tribes, to signify that they were not ruled by kings. In the Zend writings the Aryans are a people chosen and protected by Ormuzd. Their history disappears in the remotest and darkest night of time. More than 28 centuries before the Christian era, these western or Zend Aryans overthrew the Semito-Cushitic empire founded by Ninus or Zohack. They established a new one extending from the Indus to the Mediterranean sea, at times making inroads and devastating Hellas. These depredations, according to some historians, provoked the Trojan war. The Hyksos, who for a time ruled over lower Egypt, were expelled therefrom and migrated toward the west, are supposed by some to have been Aryans. The great Aryan empire to which Cyrus succeeded, or of which he was himself a restorer, or continuator, was never really destroyed, but through various transformations and vicissitudes continues as the Persian kingdom to our times. The tribe of Siahposh in the mountains of the Himalayas and that of the Ossets in Caucasus, are supposed to be the direct and unadulterated descendants of the primitive Aryans.—The ARYAN LANGUAGE, either as the root or as the substratum of the existing tongues, extends from the Ganges to the Atlantic ocean, from the southern region of the Himalayas to Cadiz, from Zealand to Sicily, and over the whole new world. Its principal branches are: I. The Sanscrit, or the Hindoo. II. The Zend, or the tongue of the land of Iran. III. The Greek, Latin, or Thracio-Pelagian. IV. The Celtic. V. The German. VI. The Slavic. VII. The Lithuanian, and possibly even very distantly the Iberian or Basque, as the primitive Iberians were either a branch of the Celts or the descendants of the Hyksos. The great philological prominence of this primitive language consists in its peculiar flexibility and vitality, by which through more than 45 centuries it has formed the vehicle for the mental development of our race. It has had the power to continually regenerate itself and to bring forth new linguistic creations out of what was decayed and breaking to pieces. It is most harmonious with the ever progressive spirit of man. It extends over the greatest geographical area, and in its varied scientific and artistic development, forms the most perfect and richest family of languages on earth. In the languages issuing from the Aryan, the mental culture of the human species has been best advanced, and is most prosperously developed; and modern civilization by a chain reaching through thousands and thousands of years ascends to this primitive source.

ARZACHEL, or ARZACHEL, a Jewish astronomer, a native of Toledo, in Spain, lived in the 11th century. He determined the apogee of the sun by 402 observations, fixed the obliquity of the zodiac at $23^{\circ} 54'$, was the author of the "Toledo Tables," which served as the basis of the famous Alfonsine tables, invented an astronomical instrument which bears his name,

and devised an ingenious theory, which was afterward adopted by Copernicus, to explain the inequalities in the apparent size of the sun. His treatises, translated into Latin, are found in the principal libraries of Europe.

ARZAMAS, a town of Russia in Europe, capital of the district Arzamas, government Nizhnee Novgorod, at the junction of the Choka and Tiosha; pop. 8,000. It is old and poorly built, and has 2 annual fairs.

AS, a Roman weight, equivalent to the libra of 12 ounces. The name is probably derived from *ās*, one, or the unit. *As* was also a Roman brass coin, originally an *as* in weight, but reduced at successive times, until it weighed but half an ounce; stamped at first with the figure of a sheep, ox, or sow; afterward with the face of Janus, and a ship's prow.

ASAFÆTIDA, also called *storcus diaboli* and *cibus decorum*, a resinous gum derived from the root of the *ferula asafetida*, a plant which grows in the mountains of Persia. It is soluble in alcohol and partially so in water. Its peculiar property is its strong disagreeable odor and taste. This is in the volatile oil it contains and which may be separated by distilling the aqueous or alcoholic solution. Asafetida is employed in medicine as an antispasmodic. In hysterics, nervous diseases, chronic colds, and affections of the lungs, and for numerous other diseases, it is found to be a highly efficacious remedy. It is also made use of in Persia as a condiment for flavoring sauces and food. The leaves are eaten and the root is roasted for the same purpose.

ASAHAN, or ASSAHAN, a town and district on the north-east coast of Sumatra. The district is intersected by a river of the same name, has tin-mines in the interior, and a population of 70,000. The town lies on the river, about 20 miles from the straits of Malacca, and exports rice, rattans, dye-woods, and horses.

ASAMA-YAMA, a volcanic mountain-peak, near the centre of the island of Nippon, in the empire of Japan.

ASAPH (the assembler), the person appointed by David as chorister in the musical services which he organized in connection with divine worship. The duty thus assigned him descended by a certain succession in his family, constituting them a kind of order (1 Ohron. xxv. 1, 2) parallel with the priesthood, though not equal to them in dignity or influence. Asaph is supposed to have composed some of the psalms in our canonical collection, as several of them bear his name. Kitto pronounces him a "master of didactic poetry, excelling alike in sentiment and diction." He was a Levite, and the son of Barachias. He is to be distinguished from 2 others of the same name mentioned respectively in Is. xxxvi. 8, and Neh. ii. 8.

ASAPH, SAINT, a personage of whom very little is known. He was the bishop of a small see in North Wales, about 200 miles north-west of London, established about the middle of the 6th century by Kentigern, whom Asaph suc-

ceeded. The ancient cathedral, which was of wood, was burned down. The second one, more substantially constructed, was nearly destroyed during the wars of Glendwyf, but was repaired and afterward used as barracks in the parliamentary wars. A new cathedral now occupies the site. The location of the cathedral of Asaph is near the confluence of the rivers Clyde and Elwy, and between them.

ASBEN, in Africa. See AIB.

ASBESTUS, AMIANTHUS (Gr. *ασβεστος*, unconsumable), a mineral of the hornblende family, which occurs in veins in the serpentine and other primary formations. It is remarkable for its structure, which is that of parallel fibres like thread laid closely together. These are so flexible that they can be picked out and woven into cloth. The finer variety, which has the lustre of white satin, is called *amianthus*, from *αμινθος*, undefiled. Cloth made of these minerals is not affected by any ordinary degree of heat, and may be thrown into the fire with no other effect than cleaning it. Such cloth was used by the ancients to wrap the bodies of illustrious dead on the funeral pile for preserving in it their ashes. A shroud of this cloth, containing burnt bones and ashes, was found in the Vatican at Rome in the year 1702. The material was long since applied in Milan to the making of firemen's dresses. The fibres are softened by steam, and the cloth made very coarse. We have the following interesting particulars of trials recently made with it for the same purpose in Paris; which it is the more desirable to record from the fact, that the mineral is abundant in this country, and on Staten island, in New York harbor, is found in bundles of fibres resembling slips of dry wood, some specimens furnishing these fibres of several feet in length. These trials commenced by 8 firemen, with their hands protected by amianthus gloves, carrying a bar of iron heated to whiteness some distance, and without losing their hold of it for more than 8 minutes. A fire of straw and small wood was lighted around a casting boiler, and when it was very hot a fireman, having his head protected by an amianthus hood and a metallic tissue, and bearing a wide shield upon his right arm, was placed in it, the fire being kept intensely hot while he remained. For a moment his head was surrounded by the flame, but the shield served to keep it off. He remained in this position 90 seconds, when the heat became unendurable. His pulse rose from 72 to 152. Another fireman repeated the experiment, protected by amianthus cotton, and remained exposed to the direct action of the flames upon his head for 3 minutes and 47 seconds. In another experiment, 2 long and high piles of wood and straw were erected, with side openings, through which the firemen could escape, if compelled to do so. The 4 men who were to enter the burning enclosure were covered with a new metallic texture; 2 wore an amianthus garment over a dress of cloth, made incombustible by borax, alum, and phosphate

of ammonia; the other 2 had a double garment of prepared cloth, and each of them had amianthus boots, with a double sole of the same substance. Finally, one of them carried a basket upon his shoulders, covered with metallic tissue, in which was placed a child 10 years old, dressed likewise in amianthus. This metallic tissue dress consists of a hood, the edges of which cover the shoulders and left sleeve, the right arm being protected by a shield, and of pantaloons fastened by hooks. Clothed with this armor and the habit of which we have spoken, the fireman can run or stoop easily, and can turn readily by placing one knee upon the ground. The 4 firemen thus attired penetrated to the centre of the flaming hedges, and, walking leisurely, went over it several times. In one minute, however, the child in the basket raised a cry, which caused the firemen to retreat precipitately. But it was found that he had suffered no harm; his skin was fresh, and his pulse, 84 when he entered, had reached only 96. He could undoubtedly have remained much longer, had he not been frightened, from the fact that one of the straps holding the basket to the man's shoulders having slipped a little, he saw the flames, and was afraid of falling. In a few minutes after he was as playful as ever, and experienced no inconvenience whatever. The pulse of the fireman who carried the child rose from 92 to 116. The other 3 men were in the fire 2 minutes and 44 seconds, and came out without having experienced any further inconvenience than great warmth. Their pulses rose from 88, 84, and 72, to 152, 188, and 194 respectively. The fire was very hot during the entire time. Asbestos has also been used for the lining of fire-proof safes and as a filter for chemical purposes. It is, however, in very little demand, though it is by no means a rare mineral in regions of primary rocks. Many localities in the United States furnish more beautiful specimens than are found at Staten Island, but nowhere perhaps is it so abundant, or of as good a quality for weavings. The island of Corsica is noted for the excellent quality and abundance of this mineral.

ASBURY, FRANCIS, a pioneer of American Methodism, and the first bishop of the connection in the United States. He was born in Handsworth, Staffordshire, England, in 1745, died March 31, 1816, in Virginia. He joined the local ministry of the Methodists at the age of 16, the itinerant ministry 6 years later, and was sent by John Wesley as missionary to America at the age of 25, in company with Richard Wright. In 1772 he was appointed by Wesley as general superintendent of the connection in America, an office which he resigned the following year in favor of Thomas Rankin, his senior in the ministry. But at the breaking out of the American revolution, 2 years later, Rankin, being a royalist, returned to England, and thus devolved the superintendency again on Asbury, the duties of which office he exercised through the entire struggle which gave

the colonies an independent political existence. Until the termination of the war, the Methodists of America had considered themselves members of the church of England, and their ministers laymen. They now considered the political changes of the country as separating them from that church, and therefore organized by themselves. Francis Asbury, ordained to the office by 2 presbyters, was constituted the first bishop of the new organization (1784), which office he held till his death, which occurred at the house of George Arnold, in Virginia, in the 71st year of his age, the 55th of his ministry, and the 31st of his episcopacy. During the 30 years of his episcopal labors, he travelled annually from the Androscooggin to the gulf of Mexico, and from the Atlantic to the Mississippi, and ordained not less than 3,000 preachers, and preached about 17,000 sermons. He was truly a man "in labors more abundant." Identified with the religious interests of this country through the two great struggles which have so greatly modified our political and social character, he became eminently American in his sympathies and character, and has left the mark of his native enthusiasm and energy upon the ecclesiastical history of the United States. His remains are now deposited in a vault under the Eutaw street Methodist church in Baltimore.

ASCALON, a city of Philistia, and one of the 5 satrapic seats in the time of the Judges. It lies midway between Gaza and Ashdod, on the Mediterranean, 40 miles W. S. W. of Jerusalem. It fell within the territorial limits of the tribe of Judah, and was conquered by that tribe, but subsequently regained, and, until after the times of Amos and Zephaniah, maintained a partial independence. Ascalon, with Ashdod, became an episcopal see in the 4th century, and has an important place in the history of crusades, until, by treaty between Richard and Saladin (1192), it was destroyed jointly by the Mussulmans and Christians, and (1270) Sultan Bibars filled up the port of Ascalon with stones, to prevent any further attacks by the crusaders. The wine of Ascalon is celebrated by Pliny—as are also the onions. The woes of the prophets on the 4 of the 5 satrapies of Philistia (Zech. ix. 6; Amos i. 8), accurately represent the present condition of those cities.

ASCOARIDES (Gr. *ασκαρίς*), a term used by Hippocrates, and now applied to 3 kinds of worms which infest the intestines of man: the *vermicularis*, maw-worm or thread-worm, which infests the rectum, or lowest intestine; the *tricocephalus dispar*, or long thread-worm, found in the cæcum or upper part of the large intestines; the *A. lumbricoides*, or large round worm, mostly found in the small intestines. These are not worms properly so called, but belong to the order of entozoa, in the lowest types of animal life, the radiata. The body of the large round worm is long, elastic, and fusiform, or tapering at the two extremities; the anterior being somewhat obtuse and furnished

with 3 tubercles, which surround the mouth. It was formerly believed that each individual intestinal worm united in itself both sexes, but modern observations show that the 2 sexes are distinct, in all the species of ascarides. See ANTHELMINTICS.

ASCENDING NODE, the point in a planet's orbit at which the planet passes to the north side of the plane of the earth's orbit.

ASCENSION. In astronomy, the right ascension of a heavenly body is its distance east of a line drawn from the pole of the heavens through the place of the sun at the vernal equinox. In other words, it is, among the stars, what longitude is upon the earth; and the first point of Aries answers to Greenwich or Washington for fixing a first meridian.

ASCENSION, a south-eastern parish of Louisiana, with an area of about 420 square miles, consisting chiefly of an alluvial plain on both sides of the Mississippi river. A great part of the land is subject to frequent inundations, and is extremely fertile, particularly on the banks of the river. Sugar and maize are the principal staples. In 1850 the productions were 13,488 hogsheads of sugar, 554,975 gallons of molasses, and 368,500 bushels of Indian corn. There were 3 churches, 1 newspaper office, and 300 pupils attending public schools. Capital, Donaldsonville. Pop. in 1850, 10,752, of whom 7,266 were slaves.

ASCENSION DAY, a festival of the Roman Catholic and Episcopal churches, kept in commemoration of the ascension of Jesus, recorded by the evangelist to have happened on the 40th day after his resurrection. It is kept on Thursday, and the day is also called Holy Thursday. It has been observed at least since A. D. 68, and perhaps earlier. In the 5th century Mamertus, bishop of Vienna, instituted a 3 days' preparation for this festival. They are the 3 days immediately preceding Holy Thursday, and are called Rogation days.

ASCENSION ISLAND, an island in the Atlantic ocean, between Africa and Brazil, about 8 miles in length and 6 in width. It has a fort which stands in lat 7° 26' N. long 14° 24' W. It is of volcanic formation, mountainous, and was barren and uninhabited until the imprisonment of Napoleon at St. Helena, when it was occupied by a small British force, who have continued to cultivate and improve it. Its shores supply a vast number of turtles. It serves as a depot for ship's stores and a watering place for ships.

ASOETIO (Gr. *ασοῖται*, wrestlers, or athletes; and *ασοῖσις*, exercise), a word commonly used by the Greeks to signify the exercises of the athletes during the course of training and preparation for athletic sports and trials of strength. These exercises were intended to inure the body to hardships, and prepare it for displays of force by strict rules of diet, as well as bodily exercises: all excesses of eating and drinking were carefully avoided; all indulgence was forbidden; and abstinence from sexual relations was enjoined.

The term was also applied to those who practised austere rules of virtue. The habits of chastity, poverty, fasting, watching, and retirement practised by the Pythagorean and Stoic philosophers, to train their minds and bodies to hardship and privation, were called *askesia*, or training exercise. Various orders of gymnosophists in Asia and East Africa, were ascetics, who like the present Sanyassana, Talopoina, and Bonzes, in eastern Asia, exercised their ingenuity in devising methods of self-torture. Among the Jews, the Nazarene Essenes were ascetics. According to Eusebius (*Hist. Eccles.* ii. c. 23), James the Just, the brother of Jesus, was an ascetic in Jerusalem, before the destruction of that city. The Christians in the 1st century, were more intent on purity of morals, than ascetic exercises. In the 2d century they began to make distinctions between the commands given to all believers, and the advice given to those who aimed at the higher degrees of evangelical purity. The ascetics among Christians, were divided into *abstinentes* and *continentes*. The former abstained from wine, meat, and agreeable food; the latter abstained, moreover, from matrimony, in order to attain to a higher degree of sanctity. Many laymen were ascetics in the early centuries of the Christian era, without retiring altogether from the business of life. Some of them wore the *pallium philosophicum* or philosophic mantle, and were called Christian philosophers. They formed a transition to the life of hermits and monks, which was regulated by the formation of monastic orders, in the 4th century.—*ASCETIC THEOLOGY* is the science treating of the practice of the theological and moral virtues and the counsels of perfection. Ascetic virtue consists in the practice of the maxims of ascetic theology, especially such as require great effort and self-denial.

ASCHAFFENBURG, a city of Bavaria, on the river Main, which at Aschaffenburg is crossed by a handsome stone bridge. It has a fine palace, formerly the residence of the electors of Mentz. Pop. 8,400.

ASCHAM, ROGER, an eminent English scholar, born in Yorkshire, 1515, died Dec. 30, 1568. This man, who has acquired renown, not only for his own abilities but from his illustrious pupils, Queen Elizabeth, Lady Jane Grey, Edward VI., the Brandon, dukes of Suffolk, and other great and honored persons, was of humble parentage, and was brought up by the liberality of Sir Anthony Wingfield, with whose sons he was educated. In 1530 he was placed at St. John's college, Oxford, where his diligence and application, especially to the Greek language, gained him his degree and a fellowship in March, 1534, a small preferment, which, however, made him no longer dependent on his friend and patron, Sir Anthony Wingfield. Ascham early embraced Protestant principles. In 1537 he became a college tutor, and was appointed by the university to read Greek in the public schools. When Henry VIII. founded a Greek lectureship Ascham was appointed to it, and in 1544 was

made university orator, a post which obliged him to prepare all addresses and write the complimentary and business letters to great men. For this his elegant Latinity, and the useful accomplishment of very beautiful penmanship, particularly qualified him. In 1548 Ascham was summoned to the appointment of teacher of learned languages to the Lady Elizabeth, afterward queen. He continued in her household for 2 years, when he quitted her somewhat suddenly from a pique against persons in her establishment. This discourtesy was long remembered by Elizabeth, whose favor he, however, eventually succeeded in recovering. In 1550 he was appointed secretary to Sir Richard Morysine, the English ambassador to the emperor Charles V., which appointment he retained for three years, until the death of Edward VI., and the ambassador's recall. During his absence he travelled in Germany, visited Italy, and wrote the results of his travels in "A Report and Discourse of the Affaires of Germany." Beside his duties as secretary, he read Greek with the ambassador, who was an earnest student. On his return in 1552, he was recommended to Bishop Gardiner, who appointed him Latin secretary to the queen, and on the death of Mary he was continued in his office by Elizabeth, who always required his services as tutor in the languages, in which he read with her several hours each day. Notwithstanding the emoluments of his places and his small pensions and other sources of revenue, he appears to have been in pecuniary difficulties at the time of his death, which was much lamented, and the queen declared "she would rather have thrown £10,000 into the sea than have lost Ascham." He wrote a small treatise on archery, intended as a justification of his love for that sport; it was entitled "Toxophilus" and was dedicated to Henry VIII., who ordered him an annual pension of £10 for it. He also wrote the "Schole-master," a treatise on the study of languages, which was first published by his widow. His letters to Oxford during his absence abroad were also collected and published. His works are published entire, Oxford, 1708, 8vo, and his English writings, London, 1815, 8vo, with a life by Dr. Johnson.

ASCHBAOH, JOSEPH, a German historian, born at Höchst, near Frankfort-on-the-Main, April 29, 1801. After having completed his studies at Heidelberg, and officiated as professor at Frankfort, he was invited in 1842 to fill the chair of history in the university of Bonn, which he continues to hold.

ASCHEBERG, RÜTGEN, a gallant Swede, born June 2, 1621, died April 17, 1693, who, by his prowess in the field, from a page gradually rose to the position of a field-marshal, and to the rank of a count. In the campaign of 1655, which brought Poland and Lithuania under the sway of Sweden, he took a distinguished part. At the close of the war he was admitted to the Swedish senate, and devoted the rest of his life to the promotion of the arts of peace.

ASCHERSLEBEN, a circle in Prussia, in the district of Magdeburg, of about 50,000 inhabitants, and a town of the same name, with a population of about 12,000, of whom about 10,000 are Protestants, worshipping in 5 churches, while the rest is composed of Roman Catholics, who have a church of their own, and of Jews, who meet in a synagogue. The town presents a fair array of schools, charitable institutions, and hospitals. The richness of the soil gives a preponderance to agricultural pursuits, but woollen and linen manufactures, and other branches of industry, thrive to some extent, especially potteries and stove manufactures, of which there are not less than 15, all in a high condition of prosperity. In former times the counts of Askanien resided here, and the ruins of their castle, which was destroyed in 1140, are still in existence on the neighboring Wolfsberg.

ASOLEPIADEAN VERSE, in Latin poetry consists of four feet: a spondee, 2 choriambi, and an iambus, thus:

— — | — — — || — — — | — — |

or it may be taken as consisting of 4 feet and a caesura: a spondee, a dactyl, and a caesura and 2 dactyls, thus:

— — | — — — | — — — | — — — |

Example: *Mæcenas atavis editis regibus.*

ASOLEPIADES OF BITHYNIA, an eminent physician who flourished at Rome in the early part of the 1st century B. O. Having little science or skill, he sought to attract public attention by denouncing the principles and practices of his contemporaries, and by asserting that he had discovered a simpler and more efficacious method of treating diseases. Food, bathing, and exercise, were the remedies which he chiefly employed to arrest the progress of sickness. He was remarkable for the assiduous attention which he bestowed on his patients, and not less remarkable for flattering their prejudices and indulging their caprices.

ASCOLI, an ancient city of Italy, in the Pontifical states, on the right bank of the Tronto, 16 miles west of the Adriatic. Pop. 18,000. It has a citadel, is well built, with a Jesuit's college, a museum, library, and a number of private palaces. Its harbor is defended by two forts, and is frequented by coasting vessels.

ASCONIUS, PEDIANUS QUINTUS, a Roman orator and grammarian, the most eminent of the ancient commentators of Cicero, delivered public instructions at Rome under the reign of Tiberius. He was a native of Padua, born a year or two before the Christian era, and died at the age of 85, during the reign of Vespasian. Livy and Quintilian were his pupils, and Virgil his friend and companion. Of his commentaries there remain several considerable fragments, which are written with clearness and elegance, and throw valuable light upon points of history and antiquities, and upon the forms of the Roman senate, courts, and popular assemblies. They have been republished in numerous editions, the best of which is that found in the 5th volume of Cicero's works, as edited by Orelli and Bai-

ter. The text is marred by corruptions and interpolations, and the best critics regard a portion of the commentaries usually ascribed to Asconius as the work of a later hand.

ASCUTNEY, an isolated granitic mountain on the boundary between Windsor and Weathersfield, Vermont. Its summit is 3,820 feet above tide-water, and 8,116 feet above the level of the Connecticut river. From its summit, which is much visited by tourists, is presented an extensive and beautiful prospect of the valley of the Connecticut.

ASEER, or **ASIR**, an independent state of Arabia, on the borders of Hejaz, Yemen, and Nedjed. It is situated in the interior of Arabia, near the 18th parallel of north latitude, and includes several fine valleys. These extend about 80 miles, and are at an elevation of about 8,000 feet. The lower valleys produce the date, palm, and cotton. The higher, almonds, figs, apricots, and grapes. The people of Aseer are bigoted disciples of Abd-el-Wahab, by whom they were converted to Mohammedanism in the beginning of the last century.

ASEERGHUR, or **HASSEER**, a town in British India, presidency of Bombay, district of Candish, 12 miles north of Boorhanpoor. It has a strong fort, well supplied with water.

ASELLI, or **ASELLIO**, **GASPABO**, one of the most eminent anatomists of his day, celebrated for the discovery of lymphatic vessels in the mesentery, was born at Cremona in 1581, and died in 1625. He came upon his discovery by pure accident, while dissecting a dog killed during the process of digestion. Aselli never spoke in public about his discovery, and one year after his death, in 1626, it was disclosed by some of his intimate friends. G. Hoffmann and Harvey at first contested the discovery. Harvey had already acquired universal fame, and Aselli was comparatively an obscure physician, but eventually Harvey was bound to acknowledge the merits of the new discovery. During the greater part of his life, Aselli practised at Milan. He was buried in the church of St. Pietro Celestina, where his friends erected a monument to him.

ASEN, in northern mythology, the most powerful if not the oldest race of the gods. They included 12 gods and the same number of goddesses, among the most renowned of whom were Odin, Thor, Baldur, Freyr, Frigga, Freyja, Idunna, Eira, and Saga. Their dwelling-place was Asgard, where was a splendid palace in which the council of the gods was daily held. Though this worship was native only to the tribes of Scandinavia, where it was celebrated in the poems of the Edda and in the popular songs, its influence extended throughout ancient Germany, and may still be traced in many German proper names. Thus the German names of the days of the week, which through the Saxons became incorporated into the English language, are derived from this mythology.

ASGILL. I. **JOHN**, an English lawyer, born about 1650, died in prison, in London, 1738. He made himself remarkable by his political

and religious opinions. In 1699 he was elected to the Irish parliament, but in consequence of the publication of his work, "The possibility of avoiding death, or an argument proving that according to the covenant of eternal life revealed in the Scriptures, man may be translated from hence into that eternal life without passing through death," London, 1700, was expelled from the Irish parliament, and his work publicly burnt in Dublin as blasphemous. On emigrating to England, he was elected member of the English house of commons, but was also expelled therefrom on the charge of atheism. Arrested for debt he passed the last 30 years of his life in the Fleet prison. II. SIR CHARLES, a British general, born about the middle of the 18th century, died 1833. He served in the American war and was taken prisoner at Yorktown. He was to have been put to death by way of reprisals, but was pardoned by Congress at the instance of the French government, and afterward served in Flanders and in Ireland.

ASH, a name applied to 4 different genera of forest-trees. I. *Fraxinus* (φραγς, separation; the wood being used for fences, or from the facility with which it splits), of the family *oleacea*, Juss., *dicocia diandria*, L. polygamous, calyx minute, 8 to 4 cleft; cord deeply 4-parted or none. Stamens 2 to 4. Pistillate flowers: ovary superior, compressed; 2-celled, with 2 ovules each; capsule with a membranaceous lanceolate wing (*samara*), 1-seeded by abortion; seed pendulous. Most of the species are indigenous in N. America (more than 80° E. of the Mississippi), many in Europe, few in Asia (1 in Nepal). Most are large trees, affecting shady and moist places, banks of rivers, or marshes; they prosper less in barren and bleak localities. The wood of most species is tough and elastic, and is used by wheel-wrights, carriage-makers, ship-builders, for many purposes. The most important species are the following: *F. acuminata* (*Americana*, *discolor*, white A.); leaves pinnatifid, leaflets petiolate, oblong, 8 to 4 pairs and 1 odd one, acuminate, shining, entire or slightly toothed, glaucous beneath, downy when young; grows 60 to 75 feet high. Best wood of all. From Canada to Carolina; believed to be an antidote to snake poison. *F. sambucifolia* (black, or water A.); leaves large; leaflets 7 to 9 pairs and 1 odd, sessile, ovate, lanceolate, rounded at base, rugose, shining, and smooth above, villous beneath on the veins; 60 to 65 feet high. *F. tomentosa* (*pubescens*, red A.); leaflets 7 to 9 pairs and 1; elliptic, acuminate, nearly entire, very long; petioles, and young branches downy. Good wood, more reddish than that of the others. *F. juglandifolia* (*viridis*, swamp A.); leaves very large, leaflets 4 pairs and 1; petiolate, ovate, serrate, glaucous beneath, pubescent on veins; a small tree. Michaux and Nuttall describe 7 more species and some varieties, among which *F. quadrangulata* (blue A.), of Tennessee and Kentucky, attaining 70 feet in height, with valuable wood, and *F. Oregona*, attaining 80 feet, are the most

remarkable. In Europe the principal species is *F. excelsior* (common A.), attaining 90 feet, with excellent wood, though inferior to the *Americana*. On its leaves swarm *cantharides* (Spanish flies), spreading a disagreeable smell. A variety with drooping branches (*weeping A.*) is grafted on tall stems, and converted into an arbor shading all around. II. *Ornus* (*opeiros*, mountainous), of Persoon (*Fraxinus ornus* L., flowering ash), of the same family with *F.*, but of the class *diandria monogynia*, L. calyx, 4-parted; corol, 2 or 4-parted, segments long, ligulate stamen, inserted, with 2 barren filaments; stigma emarginate; fruit-winged, 1-celled, 1-seeded. Trees of Europe, N. Asia and America. Leaves opposite, unequally pinnate; flowers in terminal or axillary panicles. Grows in shady woods. Among the American species, *O. dipetala* and *O. Americana* are most remarkable. In Europe, *O. rotundifolia* exudes the *manna*, a sweet substance which differs from sugar by not fermenting with water and yeast. It is a purgative medicine and of 2 sorts, the one whitish, which exudes by itself from fissures in the bark, and another brownish, condensed from the juice issuing from cuts made in the tree; this is more cathartic. The best manna is collected in Calabria and Sicily. Many species of *fraxinus* also yield it. The lilac and olive can be successfully grafted on the species of *fraxinus* and *ornus*. III. *Sorbus* (its bark being supposed to be an absorbent in consumption), of the fam. *Pomacea*, Juss., *icosandria 2-5 pentagynia*, L., classed under the genus *pyrus*. Calyx tubulous, urceolate, limb 5-parted; petals roundish; styles 2 to 5; drupe closed, 5-celled, with cartilaginous putamen; cells 2-seeded. *P.* or *S. Americana* (mountain-ash); leaves pinnatifid; leaflets oblong, lanceolate, acuminate, somewhat serrate; common petiole very smooth; flowers white, in terminal corymbs; fruit globose, yellowish-red, persistent almost all winter. Canada, and northern States. *Pyrus microcarpa* (small-fruited), extends from N. York into Carolina; smaller than the preceding; fruit scarlet. *S. aucuparia* (rowan-tree), common in the forests of N. Europe; grows up to 25 feet; fruit edible, after being frost-bitten and kept in hay for some time. The fruit of other species also affords food to many birds. Only one species (on the Sandwich islands) is known in the southern hemisphere. The fruits of many contain malic acid, and the flowers, bark, root of *aucuparia*, hydrocyanic (prussic) acid. The wood is valuable for many uses, and the branches were employed by the Druids in their rites. IV. *Zanthoxylum* (ζανθος, yellow, ξυλον, wood), of the family which is named from it by Juss., *dicocia pentandria* L. *Z. Carolinianum* (prickly ash, toothache-tree), a middle-sized tree with prickly branches. *Z. macrophyllum* (*pterota*, bastard iron-wood), in Arkansas, Florida; from 15 to 20 feet high. This species, as well as others (called yellow wood, satin wood, &c.) of much greater size, have hard, cross-grained wood

ASH, EDWARD, a London physician who died in 1829, and whose name acquired celebrity from its connection with the discovery of the galvanic battery, which became the basis for the construction of the Voltaic battery. Ash communicated the result of his investigations to Alexander von Humboldt, who published them in 1797, accompanied with remarks of his own on the irritability of the fibres. Various scientific essays were, in 1790, contributed by Mr. Ash to the "Speculator," a weekly London paper.

ASH, JOHN, an English Baptist divine, born in 1724, died 1779, was the author, beside some religious publications, of a dictionary of the English language, and of an introduction to Lowth's Grammar, which passed through a great number of editions. He also wrote a work called the "Dialogues of Eumenides." At one period he was coadjutor with Dr. Caleb Evans in the management of an academy at Bristol for the education of theological students of his own persuasion. Subsequently, and until the time of his death, he was pastor of a congregation at Pershore.

ASH-WEDNESDAY, the first day of Lent, called by the fathers of the church *caput jejuniæ*, the beginning of the fast, or *dies cinerum*, ash day, in allusion to the custom of sprinkling the head with ashes. The name of the day is a memorial of ancient manners. To roll oneself in the dust, to cover the head with ashes, was, in primitive times, a mark of profound grief. A man who appeared with his body, hair, and dress covered with dust, announced by such exterior his mourning and affliction. Examples of this are frequent in Scripture, being mentioned in Job, the Kings, the Prophets, and also the Gospels. David, to express the bitterness of his grief, says that he ate ashes like bread. In the first centuries of Christianity, when public penance was imposed, ashes were cast upon the heads of those who were condemned, and they were obliged to stand without the gate of the church, amid the lamentations of the people within. The ceremonies of Ash-Wednesday in Roman Catholic countries are a continuation of this primitive usage. The old linen of the altar and fragments of consecrated wood are burned, and the ashes carefully collected. Before the celebration of the mass, the priest in mourning robes recites penitential psalms, and solemnly blesses the sacred ashes. Then all the faithful approach and prostrate themselves, while the priest marks a sign of the cross with the ashes upon the forehead of each of them, repeating each time the words of the anathema pronounced upon Adam for his sin: *Memento, homo, quod pulvis es, et in pulverem reverteris*: "Remember, man, that thou art dust, and unto dust shalt thou return." The people having thus listened to the sentence of death, and each bearing upon his brow the prophetic ashes, return to their places. The sombre monotony of the ceremony, the silence which

follows it, the confusion of all ranks and the humiliation of all pride which attend this common recognition of the transiency of human life and the fearfulness of destiny, render it one of the gravest and most impressive of all religious rites. It is the overture to 40 days of penitential mourning, and follows immediately the wild excitements of the carnival, the heroes of the delirious and clamorous follies of one day kneeling on the next in silence and contrition around the altar of the church; and thus the utmost frivolity and disorder of a worldly spirit, and Christianity in all its severity and sadness as the veritable law of a fallen humanity, stand in immediate contrast. The use of ashes is omitted by those branches of Protestantism which retain any observance of Ash-Wednesday. In the Anglican church the maledictions denounced against impenitent sinners are read on that day, at the end of each of which the people repeat, Amen.

ASHANTEE, a powerful kingdom of western Africa, on the gold coast, in upper Guinea, bounded on the N. by the Kong mountains, S. by the Atlantic, E. by the rivers Volta and Loka, and W. by the Assinie river. It extends from lat. 5° 0' to 9° 30' N., and from long. 0° 55' E. to 4° 7' W. From comparative obscurity, this kingdom, under its successive rulers, has become a considerable power in Africa, having conquered many of the surrounding tribes, seized upon their territories, and compelled their chiefs to pay tribute. Its history does not reach back further than the commencement of the 19th century, when it began to advance in influence and power under King Osai Tutu. In 1807, while Osai Tutu Kwamina was king, 2 of his tributary chiefs escaping to the Fantee country, were there protected by the Fantees; and when he sent messengers demanding that they should be delivered up, the people, instead of complying, put his messengers to death. Upon a repetition of this offence, the king of Ashantee advanced into the Fantee country, at the head of an immense army, destroying towns and villages, and slaughtering men, women, and children indiscriminately, burning up provisions, and desolating the entire kingdom. The Fantees were followed even to the large seaport towns, and butchered by thousands. The British in the fort of Anamaboe took sides with the Fantees, when the Ashantee army attacked that stronghold also, and would have exterminated the garrison, had not the English governor caused a flag of truce to be displayed. The king compelled Col. Torrance, the governor, to come to the Ashantee camp to adjust the difficulty. In the engagement at Anamaboe alone, it is estimated that 12,000 were slain. In 1817, the Ashantees invaded the Fantee country a third time, reducing the people to such straits for food, that the English authorities deemed it expedient to pay the fine imposed upon the Fantees by the king, to induce him to retire. The incursions into the Fantee country interrupting the

business of the European merchants, the British resolved to send an embassy to the court of Ashantee to negotiate a treaty between the two countries. The treaty entered into stipulated that the monthly payment of 4 ounces of gold, by the English to the Fantees, as a rent for the ground on which the fort stood, should be transferred to the king of Ashantee, by right of conquest, and the governor formally and solemnly acknowledged that Fantee, including Cape Coast, and every other town in the neighborhood, belonged exclusively to Ashantee, the African company reserving judicial authority over such towns as stood in the vicinity of any of the castles. It was further agreed that Mr. Hutchinson, a member of the embassy, should remain at Coomassie as British resident, to see that the terms of the treaty were complied with. The Fantees again rebelled against the king of Ashantee, and were secretly aided by the British, who were anxious for his overthrow. The king was preparing to attack the British again, for their interference, when Mr. Dupuis arrived from England, having been appointed consul to the court of Ashantee. After much difficulty he succeeded in negotiating another treaty, mutually advantageous; but the African company refused to confirm it. As the commander of the British squadron refused to send the commissioners of Ashantee to England, Mr. Dupuis had to set out alone with the treaty, to submit it to the British government for ratification, the king promising to refrain from hostilities for a certain period. Two months after the expiration of that time, Mr. Dupuis not having arrived, the king placed Cape Coast fort under blockade. About the same time the charter of the African company was abolished by act of parliament, and its forts and other possessions transferred to the crown. Sir Charles McCarthy, the newly appointed governor-general of the Gold Coast, misled by the Fantees, who wished to be emancipated from Ashantee rule, and in a great measure ignorant of the nature of the relations between the British and the Ashantees, resolved to chastise them. The king of Ashantee, enraged at the hostile attitude of the English, and smarting under the insults of the Fantees, made extensive preparations for war. Hostilities began by the seizure of a negro sergeant in the British service, by the Ashantees, who put him to death. The king set out with a large army against Cape Coast, and Sir Charles McCarthy, rashly gathering an army of seacoast natives, advanced against him without waiting for a reinforcement of regular troops, under Major Chisholm. Jan. 21, 1824, an engagement took place across a narrow water-course. Sir Charles kept up a heavy fire during the day; but his ammunition became exhausted, and the Ashantees tried to force their way across the stream. They were repelled by the bayonet; but a party which crossed higher up, intending to cut off his retreat, attacked his force in the flank and rear, and cut them to pieces. Sir Charles himself re-

treated to where the king of Donkera was holding the enemy somewhat in check, and brought a field-piece to bear upon them. It was useless, however, for they came on like an overwhelming torrent, and the British commander and his officers, in attempting to retreat, were met by another party and instantly killed. Mr. Williams, his secretary, was taken captive, and remained a prisoner for some time in Ashantee. Every night they locked him up in a room with the heads of his companions in the war. It is said that the chiefs ate Sir Charles's heart, and dried his flesh and parcelled it out among the lower officers, while his bones were kept at Coomassie as fetiches. After this victory the Ashantees, content with their success, rested, awaiting overtures for a peace. Several other engagements followed, however, within a short time, one of which, against the English at Cape Coast Castle, nearly resulted in success; and there is little doubt that the fort would have been captured, had not smallpox and dysentery compelled the king to withdraw his army. Ultimately he was overawed, and compelled to send his son and his nephew to Cape Coast as hostages, and deposit 600 ounces of gold with the governor as security for his good behavior. Despite these reverses and losses, the Ashantees are still a warlike and powerful people, enjoying as much prosperity as any negro nation in western Africa.—They are, as will be perceived by the preceding sketch, a very barbarous people, even among African nations; but the abundance of their gold, the extent of their kingdom, and their savage and successful wars, have brought them into prominence. They have no military science, however, their success in battle depending not upon their skill, but upon the savage bravery of the overwhelming masses of warriors and slaves, which the Caboceers or chiefs bring together for the defence of the country. The king is commander-in-chief, often leading the army in battle. Among the Caboceers are grades or ranks, more distinct in the capital than in the field. As an instance of their bravery, it is recorded that many of them, after their last defeat by the English, were so mortified, or afraid of being degraded, that they sat down on kegs of powder in sight of the British camp, and blew themselves up. The government of Ashantee is a complete despotism, the king exercising absolute control over the lives and property of all classes. Holding such power, he naturally fears for its permanence, and in consequence keeps up such a system of espionage all over the country, that the remotest act or word of disaffection is promptly reported to him. When a subject is summoned to the king's presence, he goes in fear and trembling, not knowing whether he is about to be rewarded or beheaded. The king is the legal heir to all the property of his subjects, but usually abstains from taking any thing but the unwrought gold found among the effects of the deceased. Many rich men take advantage of this to have their gold made into orna-

ments, and distributed among their friends, to keep it out of the king's reach. Once in his life each Caboceer is allowed to display his wealth in public. On such occasions all the household are decked in rich robes and golden ornaments, and paraded in the streets to martial music, the affair concluding with a feast to the friends of the family. Bowdich says that one man, while he was at Ooomassie, displayed gold ornaments equal to 1,600 ounces of gold, or \$28,000. The king is the great property owner, levying a tax of 20 per cent. upon all manufactured gold, and a large percentage upon all gold taken from the mines. All taxes on trade, tribute from conquered provinces, and all the gold found in the market of Ooomassie, go into his coffers, making him the wealthiest man in Africa. On every possible occasion he makes a brave show of his wealth, loading his person, and his attendants, with ornaments of pure gold, and displaying the same precious metal in every conceivable way.—Slavery prevails in Ashantee on a large scale, many of the Caboceers owning 1,000 slaves each. These slaves are prisoners taken in war, men degraded for misconduct, and (by far the largest part) pagan negroes brought from the interior by their Mohammedan captors, and sold into bondage. While there was a free exportation of slaves to foreign countries, the slave trade was very prosperous here; but since its suppression along the seacoast, slaves have accumulated very largely. The distinction between master and slave is however becoming less marked; and the masters are afraid to abuse their power, believing that if they do, the slaves will bewitch them. Mr. Wilson knew many cases where the slaves held a larger number of bondmen than their own masters.—Polygamy is a favorite institution, a man's importance being rated according to the number of his wives. The king is limited to 8,888, which, with the exception of half a dozen, are dispersed to their plantations during the working season. While in the capital, they occupy 2 whole streets, but are secluded from all but the king and his female relatives. To see one of them even accidentally is visited with death. Adultery is punished by a fine, and violent retaliation on the part of the husband is regarded as mean and degrading. The Ashantee wife is a menial, far below her husband, ministering only to his passions, and providing for his wants. The extent of the population is difficult to determine; it has been estimated at about 8,000,000, including the tributary provinces, and 100,000 men were said to have been slain in their northern wars. The capital, Ooomassie, stands in lat. 6° 51' N. and long. 2° 18' W., and its population is variously stated by Europeans at from 15,000 to 100,000. McQueen, in his geographical survey of Africa, adopts the latter estimate, after a careful comparison of the estimates of Bowdich, Dupuis, and others. The soil is fertile, producing yams, Indian corn, sugar-cane, pota-

toes, plantains, bananas, and many kinds of tropical fruit. Cotton, indigo, and coffee are also raised in small quantities; but their cultivation might be indefinitely extended. From the coast to 60 miles N. of Ooomassie, the country is covered with a thick forest, through which travelling is extremely difficult, except by the paths or roads leading to the capital. The houses are built of clay, one story high, and thatched with grass. Their walls and doors are painted with a kind of chalk, and the outside of the doors and window-blinds often decorated with grotesque figures. The dwellings of the nobles and great men are built in a hollow square, into which the female apartments open; the roofs project over the sides fronting the street, under which there are lounges, and here the master of the house receives his visitors. The Ashantees are mechanical adepts, and manufacture gold ornaments with much skill and taste. They also tan leather, make swords, pottery, agricultural implements, and cotton cloth, the latter of beautiful patterns and durable quality, weaving it in strips of 4 inches wide, on a loom worked by strings held between the toes. Their commerce with the interior is very extensive, caravans from Houssa, Bornoo, and Timbuctoo occasionally visiting the capital. The exports are mainly gold dust, in which the country abounds (10,000 slaves being employed during the rainy season at the mines on the banks of the Barra, collecting it), ivory, and the jura nut. The mines are very rich, but imperfectly worked; and many of the richest, being sacred to their fetiches, are left untouched. The Ashantees seem to delight in the shedding of blood, and human sacrifices are part of their religious observances. At the festivals of Yam and Adai, —the former commencing early in September, when the yam crop is gathered, the latter occurring tri-weekly through the year,—human blood constantly flows. In Ashantee at least 6 different languages, or dialects of the same language, are spoken, and the Ashantee tongue is described as possessing superior euphony to many of the native languages. The wild animals are lions, elephants, alligators, hyenas, antelopes, deer, and a variety of snakes; the domesticated are principally cows, a small breed of horses, goats, and a hairy kind of sheep. In ornithology there are vultures, parrots, and a variety of small birds of splendid plumage and melodious song. (See Wilson's "Western Africa," New York, 1857.)

ASHBURN, THOMAS OF, an English Catholic writer, born at Ashburne, in Derbyshire, and lived about the middle of the 14th century. He wrote against the Lollards, and was the author of a treatise in reply to the *Dialogus* of Wicliffe. He also wrote a poem in English, with the Latin title *De Contemptu Mundi*.

ASHBURTON, a market town, and parish of England, county of Devon, and 192 miles W. S. W. of London. It has some woollen mills, and returns one member for the house of com-

mons. It is the birth-place of the celebrated lawyer, Dunning, afterward Lord Ashburton, and of the critic and poet Gifford.

ASHBURTON, LORD. See JOHN DUNNING. See also **BARING**.

ASHBURY, JOSEPH, an English comedian, born at London in 1688, died at Dublin, July 24, 1720. His first appearance as an actor was at Dublin, in the part of Iago, in Shakespeare's "Othello." He went to London, where he won much applause as a comedian; returned to Dublin, and remained a star of the first magnitude in the Irish theatre for the rest of his life.

ASHBY DE LA ZOUCH, a town of Leicestershire in England. Near it are the remains of a fine castle built by Lord Hastings, who was beheaded by Richard III. The town was garrisoned in the civil wars of Charles I. by the king. Its greatest interest lies in its being the scene of the great tournament held in the reign of Richard I., which has been portrayed to the life in "Ivanhoe."

ASHDALAG, a large village of Russian Armenia. It lies on the south slope of the Alaghez mountains, and is surrounded by rich fruit gardens, which flourish in a very mild climate. It is occupied by a population exclusively Christian.

ASHDOD, a city of southern Palestine, lying near the Mediterranean sea, a little north and east of Ascalon, and capital of one of the 5 satrapies of Philistia, after the death of Joshua, and the seat of the worship of Dagon. It fell within the allotment of the tribe of Judah in the territorial division of Palestine, though it was some time before they obtained possession of it, if indeed they ever did. We find that before the captivity the Jews had intermarried with the Ashdodites, for which Nehemiah cursed them. When the Philistines were victorious over the Israelites in the battle of Ebenezer, they captured the ark of testimony and carried it to Ashdod, and set it in the temple of Dagon, whose image twice fell prostrate before it, the second time breaking off the hands and head, so that only the stump of Dagon was left. The Greek name of this city was Azotus, and it is known in New Testament history as the place in which Philip is narrated to have been somewhat mysteriously found immediately after the baptism of the Eunuch, although above 80 miles distant from Gaza, where the transaction took place. The Arabs call this city at the present day Mezdel. It is also known in biblical geography as Eadud. It seems to have been a well-fortified place, and an important military post, from the time of the entrance of the Israelites upon the occupancy of the territory to the days of Psammetichus, who, according to Herodotus, laid siege to it for 29 years. It was also several times besieged, and partially taken by several other kings, as Uzziah, and Tartan, and the Moabean kings, who finally destroyed it, after having maintained a more or less successful struggle for independence since the days of Joshua. It

was afterward partially rebuilt by the emperor Gabinius. According to Robinson, Ashdod stands upon a low round eminence, with trees thick around it like a wood, probably olives, though that eminent traveller only passed within about 10 miles of it. It retains no traces of its former greatness. The heavy woes denounced by Zachariah and Amos on Ashdod, Gaza, and Ascalon, seem to find their historical counterpart in the present miserable and deserted condition of those cities; for at this day there is no king in Gaza, Ascalon is not inhabited, and the pride of the Philistines is cut off.

ASHE, a county forming the N. W. extremity of North Carolina, bordering on Virginia and Tennessee, area 600 square miles. It is a mountainous region, between the Blue Ridge on the S. E. and Stone mountain on the W. It has good grazing portions, but is generally not productive. Organized in 1800; capital, Jefferson; named in honor of Samuel Ashe, former governor of North Carolina; pop. 8,774, of whom 8,182 are free, and 592 slaves. In 1850 this county yielded 210,583 bushels of corn, 6,164 of wheat, 161,487 of oats, 4,904 lbs. of tobacco, 107,757 of butter, and 9,702 tons of hay. It contained 28 churches.

ASHE, JOHN, an officer in the war of the American revolution, and an active statesman in the period of the formation of our government, born in England in 1721, died in North Carolina, in October, 1781. He was 6 years old when his father emigrated to America and took up his abode in Newton, now Wilmington, on the bank of the Cape Fear river, in North Carolina; and there he gleaned his education, and grew to manhood. He was prominent in the politics of the colonies prior to the passage of the stamp act, having been several times a representative in the colonial assembly, of which body he was speaker from 1762 to 1765. The stamp act called forth his vigorous opposition, but he at first hesitated to follow all the opposition measures which the zeal and determination of the colonists suggested, and was as active in resisting the regulator movement of one party as the stamp act of the other. Subsequently he joined with the most zealous and patriotic of the colonists, and became active and influential as a member of the committee of safety at Wilmington, and of the provincial congress, which, it is said, he was the first to suggest, and in which he was an eloquent advocate of republicanism. He joined the army at the first outbreak of hostilities, having led a force to destroy Fort Johnson in 1775; and as brigadier-general he took part in the movements of Lincoln on the Savannah in 1778 and 1779. In the latter year he suffered a severe defeat at the hands of Gen. Prevost, at Brier Creek. He was made a prisoner in 1781, was released on parole on account of sickness, and died soon after. II. **SAMUEL**, brother of the preceding, and governor of North Carolina, born in 1725, died in January, 1818. He was

a lawyer by profession, and displayed his patriotism and talents in the council of safety, and the provincial congress of North Carolina, of which he was a leading member from 1774 to 1776. In 1777 he was appointed chief justice of his state, an office which he retained till 1796, when he was elected governor of the state. He retired from public duties in 1799. Though he was chiefly employed in civil capacities, yet in some of the emergencies of the times he served as a soldier. III. JOHN BAPTIST, son of the preceding, born in 1748, died in 1795. He entered the army at an early age, and in 1776 was appointed a captain of state troops in the continental service. He served throughout the war, reaching the rank of lieutenant-colonel, and closed his military career at the battle of Eutaw. He was elected to congress in 1787, and in 1795 was elected governor of the state of North Carolina, but died before his inauguration. IV. SAMUEL, brother of the preceding, born in 1768, died about 1880. He was a soldier of the revolution, and was made prisoner at the fall of Charleston, in 1780. After being exchanged he served with gallantry till the close of the war, first under the command of Lafayette, and afterward under that of Greene. He subsequently represented the county of New Hanover for many years in the general assembly of North Carolina.

ASHE, WILLIAM, born at Lisburn, Ireland, about the year 1759, distinguished as a performer on the flute, in which he effected some important improvements, and for which he wrote a number of concertos of considerable merit. He owed his education and subsequent advancement in the world to the generous patronage of Count Bentinck, a wealthy nobleman of Holland, formerly in the British military service.

ASHER, ADOLPHUS, a German bookseller and English author, born about 1800, died at Venice, Oct. 2, 1858. From 1820 to 1825 he lived in England, where for several years he was clerk of the Rothschilds. He afterward engaged at St. Petersburg in the diamond trade, and subsequently in 1827, while engaged in speculation at a Leipzig fair, he was determined by accident to become bookseller at Berlin. He became intimately acquainted with the book trade, and supplied a considerable portion of the rare works of the British museum, and the royal library of Berlin. Although a German, he had a partiality for the English language, in which he wrote his own works. His edition of the travels of Benjamin of Tudela is the best existing.

ASHES, the solid products of combustion, the residue of the burning of vegetable matters, coal, and animal substances. The term volcanic ashes is commonly applied to the finely comminuted dust ejected from volcanoes. This use of the word, according to Bory de Saint Vincent, is incorrect, the substance, by his examinations, proving to be not the products of combustion, but fine particles of lava ground to dust. Ashes are

composed of earthy matters and salts, and vary in quality and quantity with the materials that furnish them. Of wood ashes, even the different parts of the same plant furnish different quantities, and ashes of different compositions. The soil itself has an influence upon the kind and amount of materials taken up by the plants. Nearly all the substances found in the soil enter into the composition of vegetable matters, and are found in their ashes. Alumina is, however, very rarely met with. No inorganic substances found in the ashes of plants come from any other source but the soil. Of the portion of wood ashes soluble in water, and removed from them by leaching, or lixiviating, the greater part consists of the carbonate, silicate, sulphate, and muriate of potassa. Of the insoluble portion (leached ashes), carbonate of lime commonly forms about one-half. The remainder is mostly silicate and phosphate of lime, oxide of iron, and salts of magnesia. It is not supposed that the bases were combined with carbonic acid in the plants, but with organic acids, and that these were replaced by carbonic acid by the process of combustion. Plants that grow in and near the salt water contain soda instead of potassa, deriving it from sea salt. The following examples show how the quantity of ashes varies with the wood: From 1,000 parts, by weight, of oak, well dried, Kirwan obtained of ashes, 18.5 parts; from elm, 28.5; willow, 28; poplar, 12.2; ash, 5.8; pine, 3.4. The bark furnishes more ashes than the solid wood, and the branches than the trunk. Peat, and coal ashes, contain a large proportion of alumina; oxide of iron, carbonate and sulphate of lime, are also found in them. The principal uses of ashes are for making soaps, and for enriching land. The soluble salts of potash are dissolved out from them, and oil, or fatty matters, added to the alkaline, to produce the soap. The residue is a valuable manure, but evidently inferior to the ashes before the potash was extracted. Pot and pearl ashes are the salts of potash extracted from wood ashes. The name potash is at once traced to the method of its preparation from the extract of the ashes boiled down in iron pots. Barilla, or soda-ash, is a similar product of sea-plants, soda replacing the potash. It was formerly largely imported into this country, but is now excluded by cheaper preparations of soda direct from sea salt.—Ashes are sometimes used with lime and sand, to increase the strength of the mortar, and prevent its cracking. Bone ashes contain much phosphate of lime, the cause of the fertilizing properties of bones. Phosphoric acid, and phosphorus are prepared from these ashes. They are also used to make the "cupels," in which argentiferous lead is melted and oxidized for obtaining the pure silver. The cupels are merely bone ashes made into a paste with water, or beer and water, and then moulded and dried. In distilleries, ashes find an extensive use for the rectification of the alcoholic liquors, the alkaline matters neutralizing any acids that may be present, and thus

preventing their volatilization. It is a common impression that their great consumption in American distilleries is to give strength to the liquors after their dilution with water, and this is naturally confirmed by the violent caustic quality, not unlike that of the ley of ashes, for which much of the common whiskey of the country is remarkable. Ashes mixed with salt make a strong cement for iron pipes. Cracked pipes repaired with it bear as heavy pressure as new pipes. The cement acts on application of heat of 600°.—**SHOWER OF ASHES**, a phenomenon which frequently accompanies the eruption of a volcano. Quantities of matter resembling fine gray or black ashes are thrown aloft from the crater to prodigious heights, and borne by the winds to an astonishing distance. On the eruption of the volcano Tomboro, in the island of Sumbawa, east of Java, in the year 1815, a shower of ashes fell for 19 hours in succession. An English cruiser, 100 miles away from the island, was surrounded by the cloud, and received from it an addition to its freight of several tons' weight, and a Malayan ship was covered to the extent of 8 feet in depth. The ashes fell upon the islands of Amboyna and Banda, the latter 800 miles to the eastward, and this apparently in the face of the south-east monsoon, which was then blowing, but really carried by a counter current, the existence of which, in the higher regions of the atmosphere, was then first established. A similar phenomenon was observed in the eruption, in January, 1885, of the volcano Oseguina, on the south side of the gulf of Fonseca in Guatemala. Its ashes were carried to the eastward, over the current of the trade winds, and fell at Truxillo, on the shores of the gulf of Mexico. Ashes from Etna were deposited in Malta in 1829; and in the year A. D. 79, the cities of Herculaneum and Pompeii, which had 16 years before been destroyed by an earthquake, were buried beneath the showers which fell from the neighboring volcano of Vesuvius.

ASHLAND, a county in the N. E. part of Ohio, area 840 square miles. Its surface is hilly and undulating. The soil is of unsurpassed fertility, and especially productive of wheat, grass, and fruit. It is crossed by the Ohio and Pennsylvania railroad. It is well supplied with motive power by the Black Fork and Lake Fork rivers, which unite and form the Mohican. Organized in 1846; capital, Ashland; pop. 24,000. In 1850 this county yielded 446,818 bushels of corn, 888,718 of wheat, 278,610 of oats, 64,976 of potatoes, 22,826 tons of hay, 205,566 pounds of wool, and 868,988 of butter. It contained 44 churches, 2 newspaper establishments, 4,295 pupils attending public schools, and 70 attending academies and other schools.

ASHLAND, the home of Henry Clay, the eminent American statesman. The estate, situated about 1½ mile from the city of Lexington, in Kentucky, consists of about 800 acres, of which 200 are taken up by a noble park, charac-

terized by Lord Morpeth, who once passed several days there, as the nearest approach to an English park of any in the United States. The remainder is under a high state of cultivation, producing excellent crops of wheat, rye, hemp, &c. The house, which has been taken down since the decease of Mr. Clay, was a plain and modest structure, two stories in height, and surrounded by beautiful shade trees. This unpretending mansion was the home of Clay during more than 40 years, and after his death passed by public sale into the hands of his eldest son, James B. Clay, by whom it has been rebuilt.

ASHLARS, blocks of stone from the quarry. Sawed ashlars are the slabs, as they come from the mill, prepared for facing the walls of buildings. The term is most commonly limited to this application. Tooled ashlars are slabs marked with parallel flutings. They are often used in basements, and set so that the flutings are vertical.

ASHLEY, a county of Arkansas, bordering on Louisiana, and bounded on the W. by the Sabine and Washita rivers; area, 870 square miles. The surface is undulating, and highly productive of Indian corn, cotton, and tobacco, the latter being yielded in prodigious quantity. Capital, Fountain Hill; pop. 2,058, of whom 1,414 are free, and 644 slaves. In 1850 there were raised 65,787 bushels of corn, 14,979 of sweet potatoes, 689 bales of cotton, and 42,180 pounds of tobacco, the greatest quantity of that article produced in any one county in the state. It contains 10 churches, and 150 pupils attending public schools.

ASHMOLE, **ELIAS**, an English antiquary, and founder of the Ashmole museum at Oxford, born at Lichfield, May 23, 1617, died May 18, 1692. He was brought up for the law, and practised as a chancery solicitor. In the civil wars he quitted London and settled at Oxford. He adopted the royalist cause, and became captain in Lord Ashley's regiment of horse; and on the breaking of the king's cause by the battle of Worcester, he withdrew to Cheshire and abandoned politics altogether, until the restoration, when he obtained favor in the sight of the merry monarch, who bestowed upon him various honorable and lucrative offices. He was Windsor herald, commissioner of excise, and secretary of Surinam, with other appointments connected with those he already held. He married thrice: Eleanor Mainwaring, in 1638, lady Mainwaring, widow of Sir Thomas Mainwaring, in 1649, and on her death, in 1668, Elizabeth Dugdale, daughter of Sir William Dugdale. He was for a time the intimate associate of the astrologers and alchemists Lilly, Booker, Sir Jonas Moore, and Wharton, and in 1650 edited and published the arcanum of Dr. Dee, a work on Hermetic philosophy and the philosopher's stone. In 1658 he announced that he had abandoned astrology and alchemy in his "Way to Bliss," a treatise on the philosopher's stone. He compiled a collection of the various unpublished writers on chemistry, which

in 1652 he published under the title of *Theatrum Chymicum Britannicum*. In 1650 he made a catalogue of the coins in the Bodleian library, and in 1659 was so fortunate as to obtain from the younger Tradescant the museum of coins and curiosities which he and his father had collected at their house in Lambeth near London. In 1672 he presented to the king a history of the order of the garter, which he had long been preparing, and for which he received from the king a grant of £400. In 1679 his chambers in the temple were burnt, and the greater part of his library, with 9,000 ancient and modern coins, and destroyed a valuable collection of other highly interesting and curious articles. He had proposed to the Oxford authorities to present them with his collection and library, if they would provide a suitable building, and in 1682 the Ashmolean museum was opened.

ASHMUN, JEHUDI, agent of the American colonization society, born in Champlain, N. Y., April, 1794, died Aug. 25, 1838. He graduated at Burlington college in 1816, and after preparing for the ministry, was chosen a professor in the theological seminary at Bangor. Removing soon after to the District of Columbia, he engaged in the service of the colonization society, at first as editor of a monthly journal, but sailed for Africa, June 19, 1822, to take charge of a reinforcement for the colony of Liberia. Upon his arrival he found himself called upon to act as the supreme head of a small and disorganized community surrounded by numerous enemies. The duties of legislator, judge, soldier, and commander, were thrown upon him, and in a short time he so reanimated the spirit of the colonists, and restored their discipline as to enable them about 8 months after his arrival, by the aid of some fortifications he had constructed, and his own extraordinary bravery and conduct, to repel a surprise from a party of 800 savages, and to defeat them entirely a few days later when they had returned with increased numbers. When obliged by ill health to abandon the country, March 26, 1828, he left a community of 1,200 freemen. He arrived at New Haven, where he is buried, Aug. 10, a fortnight before his death. He not only saved the existence of the colony at Liberia, but established for it through his character an important influence over the surrounding tribes.

ASHMUN, JOHN HOOKER, professor of law in Harvard university, born in Blandford, Mass., July 8, 1800, died in Cambridge, April 1, 1838. He was entered at Williams college, but graduated at Harvard in 1818. He attended to mathematics above any other branches of the university studies, but soon devoted himself with the greatest zeal to the study of law. Here he achieved a rapid success, and upon his admission to the bar, he soon reached the front rank of the profession. He became associated with Judge Howe and Mr. Elijah H. Mills in conducting a private law school at

Northampton, and when the law department was organized at Cambridge in 1829, the first appointment was tendered him by a unanimous vote of the corporation. He held this situation until his decease, conducting his instructions and lectures with remarkable ability. His early death, in the opinion of those who were best able to judge of him, extinguished the promise of legal eminence unsurpassed, if not unequalled. His health had not been such as to enable him to put forth his whole intellectual strength, nor did his efforts receive any assistance from graces of manner; but his knowledge of legal science was profound and accurate, and his comprehension of the principles of law so perfect that he seemed to arrive at his decisions by an intuitive operation of the mind. Although the vigor of his reasoning powers was great, the accuracy of his conclusions was still more so—an unerring lamp appeared to lead him through the legal labyrinth. Even at his early age he was considered fully equal to the highest stations and responsibilities of the profession, and by his admirable private character had won a high degree of public esteem.

ASHTABULA, a county in N. E. Ohio, on the borders of Lake Erie and Pennsylvania, which was settled by natives of Connecticut in 1796. The surface is level, the soil clayey, and adapted to grazing purposes. Grand and Conneaut rivers both run through it. The county contained, in 1850, 28,766 inhabitants, and produced 56,618 tons of hay, 704,291 pounds of butter, 185,208 pounds of wool, 267,209 bushels of corn, and 189,478 of oats, which, with cattle, form its chief staples. It has railroad communication with Cleveland and Erie, and contained 55 churches, 8 newspaper offices, 4,688 pupils in the public, and 280 in private schools, at the date of the last census. Capital, Jefferson.

ASHTOLA, an uninhabited island of the Indian ocean, lat. 25° 8', long. 68° 48' E., 12 miles from the Mekram coast in Beloochistan. Its shores abound in turtle.

ASHTON-UNDER-LYNE, a manufacturing town and parish of England, county of Lancaster, on the Tame, 6 miles from Manchester. It is well situated for manufactories, of which there are 84 in active operation, spinning and weaving calicoes, working 8,588 horse-power, and occupying the labor of 14,500 work people. It has barracks, permanently occupied by a battalion of infantry. It sends one member to the house of commons. It is abundantly supplied with coal, and communicates with Manchester, Huddersfield, and Derbyshire by canals. It contains a large church of the time of Henry V., and places of worship for Methodists, Baptists, Unitarians, Roman Catholics, Moravians, and Jews. Pop. 80,676.

ASHTORETH, called by the Babylonians Mylitta, and by the Greeks, Astarte, the great female deity of the Syro-Arabian nations, bearing the same relation to their great male divinity, Baal, which the Hera or Juno of the

Greeks and Romans bore to Zens, or Jupiter. By Ashtoreth was originally meant the moon—"the queen of heaven"—and subsequently the planet Venus, and perhaps other celestial bodies. Under the name of Ashtoreth is supposed to have been worshipped one of the great agents by which animal life is preserved and perpetuated—the principle of conception and parturition. This goddess was variously represented in different ages and countries. In Canaan she was adored under the image of a heifer or calf. In Phœnicia she was at first represented by a white conical stone; afterward with the head of a bull or cow; and ultimately as a human being with a thunderbolt in one hand, and a sceptre in the other. The worship of Ashtoreth was sometimes performed in shady groves, sometimes in stately temples. Cakes made in the shape of a crescent, and male kids, are said to have been the offerings in which she most delighted. Eunuchs dressed in feminine attire, or women, were her favorite priests; and many of the rites in which they indulged at her altars were of the most lascivious and abominable character. The dove, the crab, and the lion, among animals, and the pomegranate among fruits, were sacred to Ashtoreth. The idolatry of Ashtoreth was introduced into Israel in the days of the judges, and was not finally extirpated till the reign of Josiah.

ASHWORTH, CALER, D. D., an English dissenting clergyman, born in Lancashire in 1722, died July 18, 1775. At the age of 18 he became a student in the seminary at Northampton, presided over by Dr. Doddridge, and having passed with credit through the course of study, was in 1746 ordained minister of a dissenting congregation at Daventry, a position which he retained till his death. He was recommended by Dr. Doddridge as the person best qualified to take his own place in superintending the education of young men for the dissenting ministry; and therefore, after the death of Dr. Doddridge in 1751, Dr. Ashworth became his successor as principal of the institution, and under his care several noted preachers and writers on theology were educated. Dr. Ashworth preached the funeral sermon of Dr. Isaac Watts.

ASIA, the largest continental division of the globe, includes a surface of about 17,500,000 sq. miles. The greatest breadth from N. to S. is 5,800 miles; the greatest length from E. to W. is 7,600 miles. It has a coast line of 35,000 miles, or, deducting the northern coast, in the Frozen ocean, the coast outline is about 30,800 miles. This amount gives a proportion of 459 sq. miles of surface to each mile of navigable coast line; a very large proportion of which belongs to the southern and eastern portions. The continent is bounded N. by the Arctic ocean, S. by the Indian ocean, E. by the N. Pacific ocean, W. by Europe, and S. W. by Africa, and is comprised between lat. $1^{\circ} 15'$ and $78^{\circ} 20'$ N., and long. 27° and 140° E. The surface ascends irregularly, but with a

steadily increasing elevation, from the outer line toward the centre. In central Asia the highland plains are upheaved to from 4,000 to 12,000 feet. These immense plateaus are surrounded on all sides and edged (so to say) by mountain ranges of the grandest proportions. They are subdivided by minor ranges into smaller regions. On the north and north-west, there is a prodigious extent of unbroken surface at the sea level, stretching from east to west, and from the Frozen ocean south as far as the Altai mountains. Before considering the table-lands of Asia in detail, it will be more convenient to describe the mountain systems. The number and extent of the mountain ranges whose various courses embrace every point of the compass, and their frequent breaks and want of continuity, throw some difficulty in the way of an attempt to give a simple and brief, yet comprehensive view. There seem to be 3 grand systems, that of the Altai, of the Hindoo Koosh, and of the Himalaya. The 2 latter are usually considered as one system; but we think there are sufficient reasons for dividing them. The Altai system belongs to central Asia, and runs in a mean line with the 50th parallel of N. latitude. It is the northern limit of the great eastern upland plateau. The Altai range, after running east from about 70° E. long., as far as 110° E., joins the great chain of the Aldan (called also the Stanovoi, or Yablonnois), which runs N. E. to the Arctic circle. Thus, an unbroken line is formed from the edge of the great Kirgheez steppe to Behring strait, sometimes in 2 and sometimes in 3 parallel lines, with extensive offsets and spurs running north and south. The centre of the great east and west chain, of which the Hindoo Koosh, or Indian Caucasus, is the connecting link, lies near the intersection of the 35th parallel and the 73d meridian. The towering peaks of the Hindoo Koosh connect the Kuen Lun, or Kwen-lun, and the Peling mountains of the east with the Parapomisan, Elbrooz, and the Armenian mountains of western Asia. This second great system traverses Asia throughout its entire length, from the Dardanelles to the Yellow sea. It separates the great desert of Gobi from China proper and Thibet, and divides the steppes of Toorkistan, or Independent Tartary, from the upland plateau of Iran.—The system of which the Himalaya is the colossal centre, takes a mean course N. W. and S. E., running from the extremest point of the Malay peninsula far into central Asia. The true Himalaya has a range of about 1,500 miles, with a breadth of 250. From about the point of intersection of the 28th parallel of latitude by the 90th meridian it takes a curvilinear mean N. W. direction until it strikes the Hindoo Koosh at an acute angle. Here the complication forms a group of the most stupendous peaks in the world. A modern traveller says: "I have counted here upward of 20 peaks exceeding 20,000 feet." Thence continuing a northern course, under the name of the Bolor, or Belor Tagh (a region of savage wilds, of which very little is known), the

system reaches the borders of Toorkistan. At this point it is joined at right angles by the Thian Shan mountains, which stretch far away E. into the desert of Gobi and upland plains of Mongolia. The southern extremity of the true Himalaya is connected with no less than 5 chains, which radiate from it fanwise, and traverse the peninsula of Indo-China with remarkable parallel regularity. Before these immense monuments of the earth's subterranean forces all other mountain systems, except the Andes, sink into comparative insignificance. And yet other extensive ranges are to be enumerated. The Ohang-pe Shan, a coast chain of Mantchooria, and the Corea, running N. E. and S. W., the Jushan and Kinyan, running N. E. and S. W., in the north-eastern part of China and Chinese Tartary, the Nanling in China proper, and the Vindhyan and the eastern and western Ghats of Hindostan. In western Asia we have also a chain on the Arabian peninsula, Mount Sinai, and the mountains of the Syrian desert, Lebanon, Carmel, and the other mountains of Syria and Palestine, and the Taurus, in Asia Minor, the Caucasus, between the Black and Caspian, and the Ural, running north from the Caspian to the Frozen ocean, belong to Europe equally with Asia. A chain of remarkable character and great extent branches off south from the extremity of the Aldan mountains, in the north-east of Asia, near the Arctic circle. This extraordinary chain traverses the length of the Kamtchatkan peninsula, and reappears from the ocean depths in the long succession of the Koorile islands, divides, or rather forms, the Japanese islands, again appears in the frequent intervals of the Loo Choo islands, terminating at the island of Formosa, nearly east of the Nanling mountains. In Kamtchatka the peaks of this chain are 14,000 feet high, and among them are several active volcanoes. It forms an outer ocean rampart to the eastern shores of the continent, enclosing between it and the mainland the seas of Japan and Okhotsk.—The elevated table-lands of Asia are, the great oriental plateau and the western plateau, or plateau of Iran. The great oriental plateau includes the upland plains of Mongolia and the great desert of Gobi, or Shamo, and part of Chinese Tartary. It extends from the Altaian chain, on the north, to the Kuen Lun (the continuation of the Hindoo Koosh) on the south. On the east it is separated from the alluvial lowlands of China proper by several mountain chains, while the Bolor Tagh, on the west, divides this region from the lowland plains of Independent Tartary, or Toorkistan, and from the lesser plateau of Iran. This immense series of upland plains comprises a surface of 7,500,000 sq. miles, or twice the area of Europe, at an elevation never less than 3,000 feet, and often far higher, above the sea. Its general character is a barren, dreary waste, exposed to a scorching summer sun, while in winter the cold, inseparable from a high altitude, is rendered still more insupportable by the bleak winds that blow from the north. South of the

Kuen Lun, the southern mountain rampart of the great plateau, the surface slopes upward into the still loftier mountain valleys of Thibet, a district which attains an elevation of 12,000 feet, stretching away to the foot of the towering Himalayas. On the south-east the great plateau is bounded by several mountain chains, and the territory of China proper descends by a succession of easy terraces to the margin of the Pacific ocean. On the north-east the land slopes downward, in like manner, through the steppes of Mantchooria, until the desert is checked by the Ohang-pe Shan mountains, whose eastern declivities descend abruptly—sometimes perpendicularly—to the ocean level. Northward, after passing the lofty chain of the Altai, the surface rapidly sinks to the level of the Siberian plains and steppes, the abode of a scanty population of wandering tribes. On the south-west the great plateau is bounded by the terrific and savage barrier formed by the Hindoo Koosh and Bolor Tagh, beyond which we find the western upland of Iran.—The 90th meridian, which may be taken to represent the mean north and south axis of Asia, coincides with the line of greatest elevation and depression, not only of the oriental plateau itself, and the mountains which traverse it, but also of the great Himalayan boundary chain. Commencing at the head of the bay of Bengal, this section line rapidly ascends through the valley of the Bramapootra and Bootan, and, scaling the aides of Himalaya mounts to the table lands, ascending at once to the mighty summit of Kunchinga, where it descends into the mountain valley of Thibet, 12,000 feet above the level of the sea. It cuts the Kuen Lun, the Thian Shan, the great and little Altai, and descending through Siberia along the valley of the Yenisei, reaches the Arctic ocean. At the intersection of this meridian by the 35th parallel, the great plateau, owing to the presence of the lowlands which here push far into its outline, is at its narrowest breadth. The western plateau, or plateau of Iran, is of an oblong shape. It commences about 70° E., extending west from the Hindoo Koosh and the Suleiman mountains as far as the shores of the Mediterranean, and north from the mountains which skirt the Persian gulf and Arabian sea to the lowlands of the Aral and Caspian. It includes a surface of 1,700,000 sq. miles. Its altitude is considerably lower than that of the eastern upland, nowhere exceeding 4,000 feet above the level of the sea. The physical character of the surface is greatly varied: the salt and sandy deserts of Khorassan, and Kirman, and Syria; the broken and diversified surface of Irak Azerbaijan and Koordistan; the rich alluvial plains of Mesopotamia, and the succession of hill, valley, and plain, which distinguish Anatolia and Syria. In the interval between the head of the Persian gulf and the southern shore of the Caspian, its region is greatly narrowed, less than 6° of latitude intervening. Both east and west of this line the plateau expands to its full width. The eastern

portion of this plateau is separated on the south and south-west from the ocean by a range of mountains running parallel with, but at some distance from, the coast. The strip between these hills and the sea is intensely hot, and the climate highly deleterious. On the north the Elbrooz terminates the table-land, and its northern declivities lead down to the deep depression of the Caspian. Between the Caspian and the Black sea the mountains of Armenia and the Caucasus raise an impassable boundary between the table-land and the steppes of the Don and Volga. On the south-west the plateau is separated from the highlands of Arabia by the lowlands west of the Euphrates. In general, the western plateau is deficient in water, but in the hilly districts there is a good supply of this indispensable agent to vegetation, and the labor of the husbandman is well repaid. In its climate, productions, and the variety of the human race by which it is inhabited, the western plateau presents points of analogy to Europe which are wholly wanting in the eastern plateau. This region includes the modern empires of Turkey in Asia, Persia, Afghanistan, and Beloochistan. Its soil is famous in history, and was the site of all the great oriental empires of antiquity, excepting the Indian and Chinese; on the east the Aryans, in the centre the Medes and Persians, Assyrians, and Chaldeans. Beyond them to the west were the kingdoms of Israel and Judea, with the mountain tribes, the Syrians, and the great trading communities of the Phœnicians, including the renowned cities of Tyre and Sidon. In the north-west were the wealthy, populous, and civilized Greek colonies of Asia Minor.—The lowlands of Asia are vast plains, as marked in character as the uplands which they surround. Their type is great depression of the surface, often below that of the ocean, with a remarkable uniformity of this level, affording but little fall to the great rivers which meander sluggishly to the sea. The great lowlands are the steppes of Independent Tartary, the plains of Siberia, the alluvial plains of China, the plains of Siam, and the lowlands of northern India, between the foot of the Himalayas and the Deccan. The primeval steppe north of the Caspian and Aral, the habitat of the Kirgheez Tartars, with their flocks and herds, is below the level of the Atlantic. In summer it is hot and dusty, in winter, cold and bleak. In spring and autumn an abundant, but thin pasturage covers it, soon to be dried up by the hot winds and the want of water. The peculiar atmospheric influences of the region prevent the growth of trees and the operations of agriculture. The inhabitants are nomads, among whom the usages or arts of civilization have made little progress. From the land of the Kirgheez the Siberian wastes extend north and north-east to the Arctic ocean and to the eastern shores of Asia, comprising an area of 7,000,000 sq. miles, equal to that of the eastern plateau. On the north the land is covered with impassable marshes, caused by the

overflow of the great rivers, the progress of whose waters to the Northern ocean is dammed up by the accumulated ice of the Arctic circle. In this region we find the maximum of cold, and so obdurate is the general character of the soil that a few valleys interspersed amid the spurs of the Altai in southern Siberia, which produce scanty crops of grain and fruits, have a reputation for fertility. In forcible contrast with the inhospitable plains of Siberia are the rich alluvial lowlands of China, which extend their fertile limits on the east. The facilities of communication afforded by great tidal rivers, the exclusion from the back country by the natural barriers of mountain and desert, have turned the Chinese upon themselves, and here we have the most stationary and most unchangeable among civilized nations. The lowlands of China are terminated to the south by the broken surface of Cochin China. But west of Cochin, Indo-China spreads out its fertile expanse, intersected by 5 fanlike chains, whose rich valleys present a soil of boundless productiveness. The lowland plain of Siam, a dead level, covered with a large amount of surface water, is particularly suited for those plants which require an unusual quantity of moisture. The plains of India extend from the foot of the semi-circle formed by the Himalaya, Hindoo Koosh, and Suleiman, south as far as the table-land of the Deccan, which forms the southern part of the peninsula. The Indian lowland and the strip of coast line between the shores of the Persian gulf and the upland of Iran, complete the general view of the lowlands. Outside the limits we have thus endeavored to sketch, lie the elevated table-lands of the Deccan, on the south of Hindostan, and the table-land of the Arabian peninsula. The Deccan table-land is of triangular shape, formed by the Vindhyan, on the north, and by the eastern and western Ghauts. It has a mean elevation of about 3,000 feet, and consists of plains, ridges, and single eminences. On the east, the Ghauts decline in a series of terraces to the sultry Ooromandel coast and bay of Bengal. On the west, the Ghauts slope down to the Malabar coast, which is bolder and covered with forest growth.—The Arabian table-land commences at the south-western edge of the Iranian plateau, from which it is separated by the plains of the Euphrates and the Syrian desert. The Nedjed, or northern Arabia, is a dry climate, resembling that of Persia, exposed to considerable thermometrical ranges. The Arabian peninsula consists of a table-land of considerable elevation, a parched-up and barren desert, subject to a blazing sky in the daytime, while by night the elevation makes the desert fire by no means unwelcome to the traveller. On the south, the land slopes to the more fertile plains of Yemen, which, though not really of remarkable luxuriance, is "the happy land" by comparison with the upland desert. We must also notice the extraordinarily depressed plain in the western part of the Iranian plateau, in which the Dead sea and

the sea of Tiberias are situated. This is altogether of an exceptional character, and seems to be unconnected with any other natural arrangement of the surface. The shores of the Dead sea are the lowest point on the Asiatic continent.—The Asiatic rivers are conspicuous for number, magnitude, and historical interest. If contiguity and facility of access by sea have been instrumental in promoting civilization, by means of commerce and the interchange of habits and ideas, it is undeniable that the facilities of communication afforded by great rivers have exercised an equally important influence on internal improvements, and the development of national prosperity. The unusual advantages resulting to Asiatic races from a peculiarity in the water-courses, designated by the term double system of rivers, have been much insisted on by some geographical writers. In Asia, the geographical fact of double rivers is more frequent than elsewhere. The contiguity of great cities erected along 2 navigable rivers, enclosing, as it were, an area of country, would certainly produce an important effect on civilization. But this result has equally taken place without the double rivers, while on the Amazon and its affluents, the Volga and Don, or even the Indus and Sutlej, we see no such specially marked social results. The Arabian peninsula and the desert of Gobi are riverless. The cause of this is to be found in the absence of rain. The desert of Gobi is in the region of south-westerly winds which traverse a long stretch of continent, and arrive at this point perfectly deprived of moisture. The mountain chains which surround the desert discharge their melting snows on their outer declivities. Arabia is situated between the heated regions of Africa and the Asian continent. The southern part only derives some advantage from the north-eastern monsoon, and this accounts for the fertility it enjoys. The terms riverless and rainless are comparative terms. It is not to be implied that there is not a water-course, nor that a shower is a miracle. Asia may be divided into 6 principal drainage areas. Their general outlines are nearly coterminous with the great surface divisions we have been describing. They are the Altaian or Siberian water-shed, the Manchurian, the Chinese, the Indian or Himalayan, the Armenian or basin of the Euphrates, and the great area of inland drainage, including the basins of the various inland lakes. If we except the Chinese rivers which run a mean E. and W. course, all the other important rivers of Asia that reach the coast run N. and S. The 40th parallel of latitude, which is the mean E. and W. line of the great central plateaus, seems to be the dividing line of the fluvial currents. The rivers in the area of inland drainage run in every direction, their courses being determined by the local accident of the surface. The rivers running north are those of the Siberian district; the Lena, the Yenisei, the Obi, and its great affluent the

Irtish. Their course is determined by the declivity of the northern side of the Altai system. The Lena is upward of 2,000 miles in length, and drains a basin of 800,000 square miles. The Yenisei is upward of 2,500 miles in length, and drains a basin of 1,000,000 square miles. The Obi exceeds 2,000 miles, and in its windings drains, with the Irtish and other tributaries, a basin of 1,350,000 square miles. Another river, the Olenek, is upward of 800 miles in length. These rivers abound in fish. We have already stated that the ice of the Arctic circle impedes their flow, and, of course, their navigation. The tributaries of these great rivers are navigable to a considerable extent, for, although they have a mean northerly course, they wind far to the east and west. In the north-east we find the great river Amoor, which drains the greater part of Manchuria and part of Mongolia. Its basin is triangular, and is included between the south side of the Aldan and the mountains of Kin Yan and Chang-pe Shang. It runs about 1,600 miles, and drains an area of 800,000 miles. The Hoang Ho, 2,000 miles long, and the Yang-tse-Kiang, or Kiang Khu, upward of 2,500 miles long, rise on the north and south declivities of the Kuen Lun chain. This and the Peling separates them in their whole course until near the termination of their great courses, when they again approach each other. They describe an immense circuit, and are united to the east of the mountain range by a system of canalization. The Hoang Ho traverses the plains of China, and, like the Mississippi, brings down an amazing quantity of sedimentary matter, which gives its name to the Yellow sea; their drainage area amounts to 1,400,000 miles. The Canton river, or Hoang Kiang, rising in the province of Yunnan, empties into the bay of Canton. The easterly course of these rivers is determined by the slopes of the mountains which separate the Thibetian plateau from the lowlands of China, and which gradually decline toward the Pacific in a succession of terraces.—We now come to the rivers flowing south, including the river systems of Indo-China, of eastern and western Hindostan, and, further to the west, the Tigris and Euphrates. Among them are 6 rivers of the first magnitude. All, except the Tigris and Euphrates, flow from the Himalaya and its off-sets; and 3, the Bramapootra, the Indus, and Sutlej, present the singular feature of rising on the northern declivity, and breaking through the chain to find their basin and outfall on the southern side. The rivers of Indo-China are the Irrawaddy, the Menam, and the Cambodia, together with some smaller rivers. They take their rise in the Thibetian plateau to the north of the Himalaya chain, and, passing to the east of the true Himalayas, they traverse the Burman empire and Siam down the valleys formed by the mountain chains of Indo-China, and find their way to the sea in the bay of Bengal and gulf of Siam. The Ganges and Bramapootra form a double system. They rise at opposite

sides of the Himalaya, which separates their basins; they afterward converge, and finally fall into the sea within 40 miles of each other at the upper end of the bay of Bengal. The Ganges takes its rise from the southern declivity of the Himalaya, 18,000 feet above the sea, about 200 miles N. W. of Delhi. It issues a full-grown stream 120 feet wide from a perpendicular wall of ice. The sacred river has a great number of tributaries, all taking their rise from the southern slope of the Himalaya, the holiest of which, the Jumna, joins it at Allahabad. The Ganges flows into the bay of Bengal, which it enters by numerous mouths, forming, during the last 200 miles of its course, an extensive delta. The Bramapootra, "the offspring of Brama," does not receive this name until it has run an extensive course under the names of the Sanpoo and the Lohit; it rises near the sources of the Indus and Sutlej, on the northern declivity of the Himalaya, in lat. 80° N. long. 82° E. The Sanpoo flows E. through Thibet as far as the meridian of 90° , when it turns to the south and forces a passage through the mountain chain into Assam; there it takes its grander name, and makes a long course almost due south through Assam and Bengal. It flows into the bay of Bengal; some of its mouths communicate with those of the Ganges, but the 2 rivers preserve independent channels. The drainage area of the Ganges and Bramapootra amounts to 650,000 square miles. The other great river of south-eastern India is the Indus, which has its origin on the northern declivity of the Himalaya, not far from the sacred lake of Manasarowar. It takes a W. N. W. course, runs through the valley of little Thibet, and, intersecting the great Himalaya chain in about 85° N. lat. and 74° E. long. west of the valley of Cashmere, it descends S. W. to the plains of the Punjab. The Sutlej, the chief tributary of the Indus from the E., also springs from the sacred lakes, and flows westward along the valley. At about 75° E. long. it also breaks through the Himalaya mountains, and descends S. W. into the plains of the Punjab. From Mittun the Indus flows on southerly, and empties itself into the Arabian sea by several mouths. Its length is 1,650 miles, and it drains an area of 400,000 square miles. The Indus and the valley of the Punjab possess the highest historical interest, and the ford in the neighborhood of Attock has been the great crossing place of all the conquerors, proceeding from the highlands of Persia or eastern Asia, into the rich territory of India. The Euphrates rises in two sources, one in the interior of Armenia, not far from Mount Ararat, the other in the mountains of Erzroom, on the table-lands. The river describes a circuitous course to the west, and then descends in rapids through the Tauris mountains southeasterly across the plains of Mesopotamia. The Tigris has its principal source in the mountains of Armenia, west of Lake Van. Its first course is rapid, particularly after it receives the waters

of the Zab, but on the plains its current is slow. Near the city of Bagdad, the Tigris and Euphrates approach to within 12 miles of each other, and from this point they run nearly parallel for more than 100 miles. They unite above Bassorah, and form one stream, the Shat-el-Arab, which flows into the Persian gulf. They drain a basin of nearly 800,000 square miles. The names of these great rivers bring all the flood of historical recollection full upon the mind. The Euphrates is mentioned among the rivers of Paradise, the first seat of mankind. It is "the waters of Babylon," "the great river." Some of the mightiest cities of antiquity were on its banks. Its waters gave fertility to the lands it traversed, which supported an immense population. In central Asia, the region of inland drainage, there are several rivers of considerable size. These drain into the numerous lakes of the interior. The Helmund rises in the Hindoo Koosh, flows N. W. into the lake of Hamoon, after a course of 650 miles. The Jehoon or Oxus (another of the scriptural rivers) flows through Bokhara and the Sihon or Jaxartes, traverses the N. E. part of independent Tartary. They discharge into Lake Aral. The area of inland drainage contains a number of smaller rivers which are mere collecting channels for the waters that fill the several lakes, both salt and fresh, of central Asia; the most important of these is the Kashgar or Yarkand, which empties into the lake of Lop Nor.—The internal water surface of Asia is small when compared with the coast area of the land. There are, however, several lakes, of which the Caspian sea, the lakes Aral and Baikal, are the principal. Although not comparable either in extent or importance with the great fresh water lakes of the North American continent, these inland reservoirs are of great size, and possess much peculiar geographical interest, from the great number of salt lakes as well as from their low level. The Caspian sea is the largest salt lake in the world. Its level is much below that of the ocean, and according to a recent Russian survey, upward of 800 feet below that of the Black sea. It receives the waters of the Volga, the Ural, and several minor streams. Its inland width is about 200 miles, and length from N. to S. 760 miles. Bordered on the N. by Russian territories and on the S. by Persia, its situation as a means of rapid communication on the frontier is of the first importance in the affairs of central Asia. The lake Aral is east of the Caspian, from which it is separated by the desert of Khiva. It is about 60 feet above the ocean level. Its waters are saline, but not so impregnated with salt as those of the Caspian. It receives the water of the Jehoon and Sihon, the ancient Oxus and Jaxartes. It is about 800 miles long and 150 miles wide. Great diminution in the depth both of the Caspian and Aral has taken place in modern and even in recent times. Tradition connects the two seas at some former period, and the presence of extensive depressions between them, with surface

layers of salt, favors the belief. Between the lake Aral and Lake Baikal, the depressions of the surface are shown in a chain of lakes and watercourses, the Balkash, or Zengri, Zanson, Khasebach, and Onbzhahor, all on the south of the Altai and the edge of the eastern plateau. Toward the centre are the Lop Nor and Koko Nor. The lake Baikal is a fresh-water lake, in the Altai mountains, and is the largest body of water at the same altitude on the globe. It is 1,535 feet above the level of the sea. It receives the waters of a great number of rivers, of which the Selenga is the chief, and its only outlet is the river Angara, which does not discharge a tenth of its waters, and falls into the Yenisei. It has an area of 15,000 square miles. Near its southern end is the Russian trading settlement of Kiakhta on the frontier between Siberia and Mongolia. In the Himalaya are situated the lakes of Manasarowar and Bakas Tal, not remarkable for their size, but interesting for the religious veneration in which they are held for the reason that the sources of all the great rivers of the Hindoos are in their vicinity. These lakes are 15,000 feet above the level of the sea. The lakes of western Asia are the lake Asphaltites or the Dead sea, and the sea of Tiberias. Independently of the historical interest that attaches itself to the Dead sea, it is of interest to the geographer and naturalist, lying at a level of 1,312 feet below that of the Mediterranean and surrounded on all sides by sandy deserts and volcanic hills. The sea of Tiberias, though only 60 miles distant, is nearly 1,000 feet higher, and encompassed by agreeable scenery. The salt lakes of Van and Ooroomesyah in Armenia are divided by the frontier line of Turkey and Persia. —The climate of Asia embraces every general variety and every local incident: the rainless and riverless plains of Gobi, and the superabundant moisture of the Indian sea-coast, the extremes of heat and cold in Siberia and the steppes, the more equable and agreeable climate of Asia Minor, gradations of temperature indicated both by a latitude ranging from the equator to the pole, and by a vertical range from several hundred feet below the level to 25,000 feet above it. In no part of the earth's surface are the modifications of temperature, and consequently of products, more strongly marked; while in some particular spots the inhabitants behold at one view in their valleys and hill-sides the animal and vegetable life of the tropics, of the temperate, and of the frigid zones. The same principal divisions which classify the watersheds will nearly serve for a general description of climate. The great plains of Siberia are exposed to the extremes of heat and winter cold. The town of Yakootsk, lat. $62^{\circ} 1' N.$ and long. $129^{\circ} 44' E.$, has a mean annual temperature of $13^{\circ} 48'$, and is consequently the coldest town in the world. But even this extreme is more endurable than that of Tobolsk, in which the thermometer sometimes remains for weeks at $86^{\circ} F.$ in summer, while the mean winter temperature is zero. The general

cause of this excessive disproportion is to be found in the distance of the plains from the ocean, whereby the intermediate veil of mist and cloud which in more equable climates tempers the intensity of the sun's summer rays, is wanting in Siberia. In winter the same cause produces a contrary effect. No friendly breeze charged with moisture reaches these plains to mitigate the severity of an arctic cold. The south-western winds are prevalent. These, which in Europe are warm, reach Siberia after having traversed wide expanses of land covered with ice and snow, and become cold land winds. Beside this, the marshes in the north hold the ice for a long period, and contribute to depress the temperature. The same remarks apply to the steppe district north of the Caspian and Aral, though the climate is less intolerable, and indeed to the whole of Asia north of lat. 35° . The mean annual temperature of Pekin, lat. $39^{\circ} 54'$ is $52^{\circ} 3' F.$, or 9° lower than that of Naples, which is rather more northerly. The mean winter temperature of Pekin is $4^{\circ} 5'$ lower than that of Copenhagen, which is 17° further north. The steppes are a treeless district for hundreds of miles. In spring and autumn they are covered with a luxuriant herbage of tall grasses, like the American prairies, which in summer is dried up. In Siberia extensive forests of pine and other northern trees are found in some parts within the arctic circle, while in the valleys of the Altai and other sheltered places, the cereals are cultivated. The immense rainless salt desert of Gobi, whose surface is far lower than that of Thibet, and far above that of Siberia, is exposed to variations of climate so extreme that there are no vegetable productions, except the very hardiest desert shrubs. The western plateau partakes of the excessive cold in winter and heat in summer, which mark the steppe district, but if we except the salt desert of Khorasan, the surface, though generally deficient in water even in the fertile parts, is agreeably diversified, and in parts its productiveness richly rewards the cultivator. In northern India we find the great varieties of climate consequent upon vertical irregularities of the surface. In Afghanistan we find summer in the valley, spring on the hill-side, and winter on the top, and even where we have not the panorama of the year thus spread out before the eye, the same result is attained, only on a more extended scale in contiguous districts. The sultry and oppressive plains of Sind give to the natural loveliness of Cashmere all the added force of contrast. In southern India and in the valleys of Burmah, Siam, and Pegu, we have the region of the monsoons, those regular winds which prevail alternately from south-west to north-east in the Indian ocean. The enervating influences of this climate are mitigated by the cool breezes from the mountain ranges. In the prolific vegetation, the magnificent specimens and the gorgeous array of the forest and jungle, we see the result of warmth and moisture, the two conditions most favorable to vegetable

generation and development. In approaching the equator the line of perpetual snow commences at a gradually increasing altitude. The Himalaya chain presents the singularity of a difference in the snow line on the northern and southern declivity. On the southern declivity, lat. $30^{\circ} 45'$ to 31° N., the snow line of the Himalaya is at 12,982 feet above the level of the sea, about equal to that in the same latitude in other quarters of the globe. But on the northern declivity, owing to the influence of the currents of air coming from the Thibetian plateau, the snow line does not commence until the height of 16,680 feet. This fact, which was announced by Von Humboldt, and disputed, has been established beyond doubt. In Von Humboldt's great work on central Asia, the subject of climatology is presented to the reader in the following general summary: "The continent of Asia extends from east to west, over a breadth of longitude 8 times as great as that of Europe. Between the mouths of the Yenisei and the Lena, it attains the 75th degree of latitude. Everywhere its northern coasts reach the limits of perpetual winter; the summer limit of the polar circle is only at a few points beyond the coast line. In the open plains of the meridian of Baikal, no friendly mountain chain breaks the force of the polar winds until the 52° parallel, while in the plains west of the meridian of the Bolor-Tagh the unbroken expanse reaches to the still lower latitude of 38 or 36. The north wind sweeps over a snow-covered surface which stretches away to the pole and includes the region of the maximum of cold. Continental Asia presents a comparatively limited surface to the solar influence of the torrid zone. Between the meridians which bound the eastern and western limits, those of Cape Tchoukotskoi and the Ural, in the enormous range of 121° of longitude, the equator passes over the ocean. With the exception of a small part of the islands of Sumatra, Borneo, Celebes, and Gilolo, there is no land in all this breadth under the equator. The continental portion of Asia in the temperate zone enjoys but little of the rising strata of warm air which the vicinity of Africa makes so beneficial to Europe. Other causes of coolness in Asia are its configuration in a horizontal sense, the form of its contours, the inequalities of its surface in a vertical direction, and its easterly position in relation to Europe. Asia comprises an upheaving of the continent in continuous masses, without depression or important peninsular extensions north of the 30th parallel. Lofty mountain systems running east and west, whose highest chains seem to confine those of the tropics to the nearest lying vicinities, oppose themselves in a long line to the passage of the southern winds. Very lofty plateaus which, with the exception of western Persia and Thibet, are less connected with each other than they are generally considered to be, lie scattered from the mountain knots of Cashmere and Ladakh as far as the sources of the Orkhon, in a gene-

ral S. W. and N. E. direction. They traverse or enclose valleys, uplift and maintain masses of snow until far in the summer, and by the currents which they send down exercise an influence on surrounding regions, and depress their temperature. These uplands change and individualize the climate east of the sources of the Oxus to the Altan and Tarbagatai far in the interior of central Asia between the parallel chains of the Himalaya and the Altai. Finally, Asia is separated by the whole width of Europe from the seas west of the westerly coast, which, in the temperate zone, are usually warmer than the eastern shores of a continent (unless cool ocean currents depress the mean temperature). The breadth of the European continent from the meridian of the background of the Finnish lowland, contributes to the cooling down of the prevalent westerly winds, which become land winds to that part of the old world lying east of the slightly elevated mountain wall of the Ural."—The line of the limit of trees in Siberia is determined by the convexity of the coast-line, from which it preserves a tolerably even range, the most northerly point is about 70° north, at which point the usual Alpine vegetation of mosses and saxifrages commences. This is a region of marshes. From this point south, the Alpine pine, the fir, larch, and birch, are found in extensive forests. The long frosts, and the dry, cold winds, render Siberia unfavorable to the production even of the hardier kind of cereals at a latitude considerably lower than that of similar productions in Europe. In the south of Siberia the land is broken up into valleys and sheltered spots by the northern spurs of the great and little Altai, and here the successful cultivation of wheat and garden produce commences. The oak first appears at about the parallel 50° , near the northern end of the lake Baikal. The vast riverless and arid district of the upper plateau is an unbroken expanse of stony and sandy desert, unrelieved by tree or vegetation, if we except some few thorny cactuses and similar plants, although even to these the cold winters are unfavorable. Some few plants, which have been transferred to this inhospitable region, have reappeared, but in such stunted and altered shape that their character is lost. The asafetida grows on the southern region of this plateau near the Himalaya. In some of the sheltered places on the mountain-sides species of forest trees are met with, but under a much altered character. Westward toward the lower plateau, on little Thibet and in Thibet itself on the sides of the Himalaya, there are spots which favor cultivation, and somewhat approximate in the character of their flora to the more temperate region south of the dividing ranges. Lassa is celebrated by the Chinese for its vineyards. These perhaps are in sheltered valleys, Lassa itself being 9,000 feet high. Of the steppes we have already spoken in connection with the climate and the pastoral pursuits of their inhabitants.

The plateau of Iran is divided into 2 botanical regions. There are large tracts of fertile country, in which all the cereals flourish luxuriantly, together with the fruits and flowers which usually characterize the wild belts of the temperate zone. The drawback of these countries is the dryness of the atmosphere, for which the ancients found an antidote in irrigation. The Cyclopean remains of their works for this purpose in the plains of Mesopotamia and eastern Syria attest their industry, and history tells us of the rich reward which they harvested. In the present day the provinces of Irak Arabee, the hilly provinces of northern and western Persia, and the watered slopes of the mountains, yield vegetable productions of the first quality and of rare beauty. The climate closely resembles that of Spain. The tobacco of Sheeraz is unrivalled for its delicate fragrance throughout all the East, and wheat, maize, oranges, pomegranates, grow in perfection. The other region included in this plateau is desert, not truly the desert of central Asia, destitute of all vegetation, but only producing those types which tolerate an exceedingly arid soil and atmosphere. South of the Hindoo Koosh the climatic influences present the same general characteristics, but the fertility is increased by the presence of greater moisture. The vale of Cashmere in lat. $34^{\circ} 7'$, at an altitude of 5,818, possesses a climate which passes among orientals for the perfection of earthly loveliness, yet in this valley from December to March snow is found several feet in depth. The productions of Cashmere include every variety that does not require the uniform heat of the tropics. The choicest fruits and trees of Europe are here indigenous. The floating gardens of Cashmere, supported by the thick growth of aquatic plants, are objects of curious interest. The great plains of northern India are the balance to this luxuriant and bounteous nature, and the burnt-up plains of Sind and Beloochistan partake of the desert character before mentioned. The great Himalayan chain presents distinct zones of vegetable productions, with this remarkable circumstance, that on the Thibetian side (where, notwithstanding the great cold, the absence of moisture causes, as we have seen, an elevation of the snow line) the zone of vegetation rises much higher than on the southern side. Von Humboldt tells us that "the character of Himalayan vegetation is expressed by 8 species of pine, 25 oaks, 4 birches, 2 kinds of scutis (the wild chestnut tree of Cashmere, which grows to a height of 100 feet), 7 maples, 12 willows, 14 roses, 8 species of strawberry, 7 rhododendrons, one 20 feet high, and many other northern forms. Among the *coniferae* the *pinus deodara* (the timber of the gods) is nearly allied to *pinus cedrus*. Near the limit of perpetual snow are found the large and showy flowers of the gentian plant, *swertia*, *parnasias*, peony, and tulip, with others more peculiar to the Indian Alps." The tropical vegetation at the foot of the hills is found at a considerable

elevation, where sheltered valleys favor their growth. Wheat is cut at the altitude of 10,000 feet, capsicums, turmeric, and ginger at 4,000 feet. The true Indian region includes in its productions all the tropical plants and trees which dense forest, impervious to the rays of the sun, and bathed in continual moisture, will produce, while on the ascending highlands we meet with the productions of more temperate climates. The sapan, the teak, the bamboo, grasses which grow to canes, and reeds that shoot up into the dimension of trees, are found in the swamp and jungle. In the open grounds the palm and cocconut, the banyan tree, mangoes, plantains, bananas, guavas, the hazel nut, indigo, maize, cotton, hemp, sesamum, and a countless profusion of the most gorgeously colored flowers, make up the general idea of the Indian flora. The Chinese flora, with other peculiarities, possesses the tea-plant, whose successful cultivation is confined at present to the region on the eastern lowland, between the 80th and 88d parallel of north latitude. Attempts have been made to introduce it into that part of the Indian region which most resembles its native habitat; but although it has been successful in Assam, as a matter of scientific enterprise, it can hardly be said to have succeeded as yet in a commercial point of view.—Asia is probably the original habitat of all the domestic animals which have become so indispensably useful to mankind: the horse, the ox, the sheep, the dog, the camel. Few of these species are now to be met, even in Asia, in a really wild state. The Arabian and Syrian deserts, and the plains of Mesopotamia, have been renowned from the earliest ages for their incomparable horses. Of oxen, there are 4 distinct species: the Indian ox (*bos Indicus*), remarkable for his haunch, and held sacred by the Hindoos; the yak (*bos grunniens*), of central Asia, with silky tail, used for military standards and fly-flaps; the buffalo (*bos bubalus*), a huge unwieldy and ferocious brute in his wild state, but docile, though somewhat stupid, when domesticated; the gayal (*bos gaurus*), of Indo-China. Among goats the Cashmere variety is world-famous for the silky hair, of which the rare shawls are made. Of sheep, the fat-tailed Persian breed is remarkable. Dogs of all kinds and varieties abound in Asia. The pariah dog of Hindostan does the duty of a public scavenger, and another breed does the same duty at Mecca. The Persian greyhound, and the great mastiff of Thibet, are the noblest of the canine species. Among the carnivora, the Bengal tiger is the most terrible, and a singular circumstance is narrated of this animal, that during summer he ranges in the plains beyond the Himalaya. The elephant and the rhinoceros are great among pachydermata. The musk deer is a remarkable ruminant confined to Asia. Out of all the known species of animals, 422 are stated to belong to Asia, and of these 288 are peculiar to that continent.—The islands of Asia include the Kooriles,

the Japanese islands, the Loo Choo's, Formosa, the Philippines, Ceylon, the great islands of the equatorial region, Java and Sumatra, Borneo, Celebes, the Moluccas, and numerous minor groups, which will be treated under their respective titles. The islands of the equatorial region are distinguished by the same general characteristics of climate and natural productions. One point, in reference to the human variety by which they are inhabited, is worthy of notice. The western equatorial islands, contiguous to the continent, are principally inhabited by the Malay type. In the great island of Papua, though not at an extraordinary distance from the other, we find a new variety, the Papuan, which has gradually extended itself over the great Australian continent and Australasian islands. This variety is by some writers erroneously likened to the negro race; but the difference is marked both in the cranium and facial outline, and in peculiarities of the body and lower limbs. There is more affinity with the Malay than the negro. To the cotton plant and the sugar cane are added those plants, the development of whose aromatic property requires long-continued dry heat. Cinnamon, pepper, ginger, nutmeg, together with the cocoa palm, the bread-fruit, sago, papaw, and banana, now appear in all the vigor and luxuriance of their native soil and atmosphere. The carnivorous animals decrease in number and ferocity, their place being supplied by the quadrupeds and the reptiles, whose venomous powers are in the highest degree of concentration. In Papua the phalangiers appear in strong numbers, the marsupials become a more important class, and the bird of paradise is a magnificent addition to the feathered tribes.—The mineral wealth of Asia consists of gold, silver, and copper, found in various parts of the continent, the Ural and Altai being particularly rich in mineral deposits. Iron is found in all the hill regions beyond the limits of the great central plateau. Coal is found in China, in Turkey, and Japan. In India, veins of coal have been profitably worked for many years. Mercury is found in China, Thibet, Japan, India, and Ceylon; lead in China, in the Altai, Siam, Japan, Persia, Arabia, and the Taurus. Of precious stones, the diamond is found in India and Siberia; rock crystals and amethysts in the Altai, Himalaya, and Ural; the jade stone, in Toorkistan; the beryl in the Baikal range of the Altai; lapis-lazuli on the banks of the Oxus.—The kaolin clay of Japan and China enables those nations to reach their unattainable perfection in porcelain manufacture. The petroleum of the Caspian, the asphaltum of the Dead sea, the bitumen of the Euphrates, are remarkable productions. Rock salt is found in the Ural, and the Altai, while common salt is found on the surface throughout Asia. The organic remains of northern Siberia are peculiarly worthy of notice, possessing an interest far beyond the ordinary fossils of the geologist. Animals of extinct species have been found im-

bedded in ice, and preserved by natural process, in all the perfection of their original form.—If we turn to the pages of history, we recognize in this division of the world the probable birthplace of mankind, as determined independently of revelation. From Asia originated also the great religious movements of mankind; Pantheism and Buddhism; the Monotheism of the Jew, with its obligation to extirpate idolatry; the pure and benevolent faith of the Christian; the divine unity of Mohammed, with his injunction of compulsory acknowledgment that there is but one God and that Mohammed is his prophet. Northern and central Asia is the great parent hive from which swarms have issued to root up the ancient landmarks and overthrow kingdoms. Alaric, Attila, Genghis Khan, Tamerlane, are familiar names, but how many have escaped the notice of history! Far off in eastern Asia the torrent of migrating nations had been set in motion centuries before our era. The earliest known is "the attack of the Hiongnu (a Turkish tribe), on the fair-haired and blue-eyed perhaps Indo-Germanic population of the Usun, dwelling adjacent to the Yüeti Getæ in the upper valley of Hoang Ho in north-western China. This desolating torrent proceeding from the great wall erected against the Hiongnu (214 B. C.) to the most western parts of Europe, moved through central Asia north of the chain of the Himalaya." Asia was the seat of the Assyrian, Babylonian, Persian, and Macedonian empires, the mightiest of antiquity except the Roman. The great cities of Babylon, Nineveh, Susa, Ecbatana, Persepolis, Otesiphon, Seleucia, Palmyra, the cities of Asia Minor, Tyre and Sidon, with others equally memorable in history, keep before our minds the ancient glories of Asiatic power and dominion; while in after ages Bagdad, Bassorah, Damascus, Aleppo, and even the distant Samarcand and Balkh in the wilds of central Asia, bespeak the progress of civilization and intelligence. What does not mankind owe to Indian sages and Chinese philosophers? From them the ancients drew their inspiration. The priests of On, or Heliopolis, and of Thebes, borrowed the secrets of nature from India. Pythagoras and the Greeks acknowledged the source from whence their knowledge sprang. The Macedonians, victorious in arms, could not emulate the wisdom and knowledge of the Bramins. From Asia proceeded all the science, all the philosophy of antiquity, whether drawn from the long catalogue of facts recorded by the sages of Chaldea, whose chronology at Babylon, as known to Aristotle, extended back to 2400 B. C., or drawn from the lore of India and China. "In the early twilight of history we perceive several shining points already established as centres of civilization, radiating simultaneously toward each other." The investigations of the learned Lepsius have discovered drawings and inscriptions in the Egyptian tombs which take back the epoch of a consolidated civilization in Egypt to 3400 B. C. In the days of Abraham a kingdom in

all its political proportions is authenticated. There is every probability that this civilization was drawn from the fountain head of intelligence in northern India or China. The regular chronology of the Chinese goes back to 2700 B. C., or 1600 years before the siege of Troy. Many literary monuments of the 18th century, B. C., remain, and in the 18th, Tscheuli records the measurement of the length of the solstitial shadow, which was so exact that Laplace found it accordant with the theory of the alteration in the obliquity of the ecliptic. In the present state of knowledge as to Indian records and antiquities, the history cannot be established satisfactorily anterior to 1200 B. C., but some of the Sanscrit writers have traced out a period of 4000 years B. C. The great era of modern oriental history dates from the establishment of Mohammedanism and the downfall of the Roman and Persian empires. A second epoch may be said to commence with the discovery of the passage by the Cape of Good Hope, but this is properly only the inauguration of new commercial relations between the southern peninsula of India and the European powers. The rise of the East India company and the establishment of the British empire in India, form the epoch from which, in all probability, future historians will date the changes in southern Asia. The introduction and propagation by Mohammed of a new form of religious belief, set the primitive, vigorous, and highly imaginative inhabitants of the Arabian peninsula in movement. Passing over the various dynasties of the caliphate, we come to about A. D. 1000, when Sultan Mahmoud, a Khorasan chief, having subdued Afghanistan and the eastern part of Persia, made Ghuznee his capital, and swore that he would make an annual campaign into India for the establishment of Mohammedanism and the extirpation of idolatry. For 10 successive years he crossed the Indus, carried his conquering arms into the great peninsula, penetrated as far as Delhi; but though always successful in his forays, he achieved no permanent settlement. His successors filled the throne of Afghanistan until 1159, when Mohammed Goree, a native chieftain, expelled the dynasty of Mahmoud, succeeded to the throne of Persia, and carried the tide of conquest as far as the Ganges. In the west the energy of Mohammedanism was displayed in the vigorous resistance of the sultans of Egypt, Damascus, and Trebizond, to the forces of the crusaders, and the active harassing warfare which they maintained after the capture of Jerusalem by Godfrey of Bouillon, and the western princes (July 15, 1099), and by which they finally expelled the Christians from the Holy Land.—We approach a period from which the modern relations of Europe with central Asia, India, and China, may be said to have taken their first commencement. In 1296 another of the mighty migratory movements of nations took place. A vast human flood, under Genghis Khan, surged in from the plains of

oriental Asia, and like the bursting of some upland lake spread its overwhelming waves in a constantly increasing circuit until further progress was stayed by exhaustion. This extraordinary movement overwhelmed China, India, western Asia, and the conquering tide rolled on as far as the centre of Europe. The sanguinary battle of Liegnitz, in which Duke Henry of Silesia fell with the flower of Teuton chivalry, seems to have stayed the course of this terrible scourge. The Mongols, on the announcement of the death of Genghis, retired, but their yoke remained firmly fixed on Russia, where the Golden Horde held sway for more than 200 years. In Bagdad they terminated the dynasty of the Abbassides and the office of the Omra al Omrah. The caliph Mustanser made a vigorous resistance. His son and successor, Mostassem, led an immense army against the invaders, but he fell with 200,000 of his best troops, and the conqueror, Hulaku, took his seat on the throne of the caliphs. At the same epoch the Mongols established the succession of Genghis Khan on the throne occupied by the descendants of Mohammed Goree, thereby founding the Mongol power in India. (The successors of Genghis were subsequently displaced by Tamerlane's descendants.) The great body of the Mongols themselves embraced Buddhism, but at what period is uncertain, but probably after the death of Genghis. The Mongols of India adopted the dominant religion of northern India, in which Mohammedanism had, as we have seen, been introduced by Sultan Mahmoud of Ghuznee. By the same irruptive movement, the native dynasty of the Chinese was displaced, and a Mongol line of sovereigns set up in their stead, of whom Kublai Khan was the first and ablest. The conquerors made no attempt beyond grasping the supreme rule. The immense numerical superiority of the natives compelled the invaders to adopt their manners, customs, and language, while the Chinese, accustomed to a despotism, and indifferent to a change of masters, remained for a while content. Hitherto Asia had been known to Europeans only through the information obtained at second hand by the Venetian and Genoese traders with the Levant and Egypt. The productions of India and the far East found their way to Europe by the Red sea and Egypt, or by the Persian gulf, connected with the overland caravan routes between Aleppo, or Damascus, and Bagdad. An internal caravan route had been established, it is impossible to say how early, between Asia Minor, the valley of the Euphrates, and the ancient cities of Persia and Media. The Greeks of the Macedonian empire carried on a caravan trade between the cities of Babylonia and Persia, and north-western India. But among the fierce tribes of Hyrcania, Aryana, Gedrosia, and the other districts of Persia, it is not probable that there was much commercial intercourse.—In the middle ages, after the establishment of the Mohammedan empire, the long-established regular lines of communication be-

tween the Mediterranean and principal cities of Persia, and, by means of the Euphrates and Tigris, through Bassorah to the Persian gulf, and thence to the ocean, were soon adopted. From these cities not only was an inland commerce carried on among themselves, but from Teheran, by way of Nishapoor, Herat, and Cabool, the road was open into northern India, and by way of Bokhara, Samarcand, Cashgar, and Yarkand, the road was opened to the Thibetian plateau, and to the northern declivities of the Himalaya. The conquests of the Mongols of the Tartarian steppes, and southern Russia, were also the means of creating an intercourse in that direction. The conquests of the savage tribes, which in the course of 26 years had penetrated from the Chinese wall to Craoow, in central Europe, and to the shores of the Mediterranean in western Asia, induced a feeling of terror in Christendom. The monks, John di Plano Carpini, and Nicolas Ascelin, were sent to Batu Khan, at Karakorum, and in 1248, Rubruguis, or Ruysbroek, a Brabanter, was sent to Mangu Khan, the successor of the great Genghis. These men were sent as missionaries, from some vague hope of establishing friendly relations with the Mongolians, and even of inducing them to coöperate with the western powers in the conquest of the Mohammedans. Rubruguis has left some interesting accounts of the Mongols, and of their capital. In fact, he may be said to be the first European who has, from personal knowledge, given any account whatever of the great countries which the ancients distinguished by the vague name of Scythia, and of which very little has been gleaned from the works of the Arabian geographers. He recognized the identity of the Huns, Bashkirs, and the Hungarians, with the Fin, or Uralian type. He found Gothic tribes still preserving their language in the fastnesses of the Crimea. Twenty-five years after Rubruguis, the celebrated traveller, Marco Polo, also travelled in central Asia and Mongolia. He resided for a period at the court of Kublai Khan, the conqueror of China, by whom he was held in great estimation. He was employed by that sovereign in various ways, and was governor of the province of Kiang Nan. Marco Polo has earned the reputation of the Herodotus of the middle ages, and from him we have an admirable account of central Asia, China, and India, the correctness of which, though once doubted, has been amply confirmed by modern travellers. Great part is derived from his own personal recollections, the rest from compilation and information, in which it is thought by orientalists that he borrows from the Chinese writers, especially the travels of Hsuan Tsang, a Buddhist pilgrim of the 7th century. The communications opened with central Asia by the spread of the Mongol empire from Moscow to the eastern shores of Asia, and the information brought to Europe by Rubruguis and Marco Polo, served to increase the yearnings for participation in the fabulous wealth of the East. These led to

the discovery of the Cape of Good Hope by Bernardo Diaz, and the sea passage to India by Vasco da Gama in the 15th century.—Before that epoch, however, some not unimportant political changes had taken place in western Asia. The vast Mongolian empire of Genghis had, after a few generations, crumbled away. The tribes from whom the guards of the throne and person of the caliphs had been chosen, driven from their native plains by the Mongols, had assumed the position of independent conquerors, and had founded the Ottoman empire. In 1299 Othman led his followers into the ancient province of Bithynia, nearly opposite Byzantium, and made Broussa his capital. The able and energetic Amurath, and his terrible son Bajazet, soon overran the provinces of Asia Minor, and crossing into Europe, possessed themselves of the Byzantine provinces. But a new invasion of the Mongols, no less fearful in its accompaniments than the former, now swept over Asia. Tamerlane had conceived the idea of restoring the empire of Genghis. Setting his hordes in motion, he passed like an avenging whirlwind from the wall of China to the shores of the Mediterranean, smiting down and crushing every nation and dynasty which opposed his progress. For a short period the Mongol and Ottoman stood face to face. But two such neighbors could not long remain quiescent. Their vast forces met on the plains of Angora (A. D. 1402), to contend for the empire of the world. The forces of Bajazet are said to have numbered 500,000 fighting men, while Tamerlane's masses were still more numerous. Bajazet suffered a most complete overthrow, and was himself taken prisoner. But the Ottoman power, though shaken, was not broken. The vigor of Amurath III. restored it, and in 1453, his successor, Mohammed II., rode through the breach into Constantinople, after one of the most terrible sieges and valiant defences recorded in history. Under Solymán the Magnificent (A. D. 1520-56), the Ottoman empire reached its present limits in Asia, comprising Asia Minor, Syria, the country as far as the Tigris, and Arabia. A quarter of a century after the permanent establishment of Mohammedanism in Constantinople, Bernardo Diaz doubled the Cape of Good Hope (A. D. 1486). Three years afterward, Vasco da Gama arrived at Calicut, on the coast of Malabar. Da Gama made an alliance with the rajah of Calicut, and on his return, Almeida and his successor, Albuquerque, were sent out and formed Portuguese settlements. The city of Goa, which had belonged to the rajah of the Deccan, was besieged and captured (A. D. 1510), and became the capital of the Portuguese empire in the East. At this period, so pregnant with political consequences to Asia, China was in the hands of a Chinese dynasty, which had been established in 1257 by the extirpation of the Tartar descendants of Kublai Khan. In central Asia the empire of Tamerlane had rapidly broken up. The thrones of Samarcand,

Isfahan, Afghanistan, and Khorassan, were filled by descendants of Genghis or Tamerlane. A number of petty chiefs maintained their independence; and the Uzbecks, the successors to the country and predatory habits of the Turks, harassed all the territories within their reach. At the same point of time in which Albuquerque was founding European dominion in India, Baber, the great grandson of Tamerlane, was meditating the restoration of his ancestral empire in northern India, and had already commenced that career of action and enterprise which resulted in the accomplishment of his great design. In Persia the first of the Sufi dynasty had just ascended the throne: the promoter of those religious differences of Soonnees and Sheeahs which have proved the source of irreconcilable enmity between Turk and Persian. The Portuguese soon extended their relations with the inhabitants and princes of the Deccan, and Albuquerque directed a successful expedition against Malacca, where he received the submission of the keys of Pegu and Siam. He also seized Ormus at the mouth of the Persian gulf. In 1518, in consequence of his reports, an embassy was sent to China which was well received; and the Portuguese, having been fortunate enough to gain the favor of the court of Peking by extirpating a band of pirates that infested the coast, permission was given them to settle in the country, and Macao was assigned as a residence. From this point and from Goa they directed their operations, and in 50 years were masters of the Spice islands, and monopolized the whole trade of the eastern ocean; the Moguls themselves purchasing from the Portuguese the productions which they brought from more distant parts. The subjugation of northern India by the emperor Baber in 1527, and a succession of able princes, Humaiyoun, Akbar, Jehangir, Shah Jehan, and Aurungzebe, consolidated the empire of the Moguls in India. Abbas the Great, the shah of Persia, was contemporary with Aurungzebe, and raised the Persian empire to its highest pitch of modern greatness, while the vigorous opposition which he maintained against the power of the Ottomans, compelled them to turn their attention to their eastern territories. Europe owed a respite from the sultan's conquering arms. During this reign a battle between the Persians and the Usbecks took place near Herat, in which the Usbeck power was broken and Khorassan relieved from their incursions.—The brilliant successes of the Portuguese in India inspired adventurers of other nations with hopes of wealth. But it was not until the year 1600 that the English East India company was formed, and in 1612 English factories were established by leave of the native authorities at Surat, Ahmedabad, Cambay, and Gogo. The jealousy of the English adventurers at the power of the Portuguese soon induced them to join with Shah Abbas in reducing the island of Ormus, which had been in possession of the Portuguese ever since its seizure by Albu-

querque, in 1507. Accordingly, in 1622, the Portuguese were driven out, and Ormus again passed into the power of the Persians. From this the English, however, derived no immediate advantage. In 1641 the native dynasty of the Chinese, which had held the throne of Peking for nearly 8 centuries, was terminated by the rebellion of the mandarin Listching, and the Mantchoo Tartars again ruled the vast empire of China. In 1640 the settlement of Madras was founded by the East India company; in 1645 the factory which formed the foundation of Calcutta was established, and in 1664-'5, after a contest with the Portuguese, they succeeded in getting possession of the island of Bombay. The conclusion of the reign of Aurungzebe and the commencement of the 18th century was marked by the first appearance of the Mahratta powers, a confederation of Hindoo chiefs in India. At the same period the English East India company, which had been unsuccessful as a trading undertaking, was reorganized, and in 1708 a new body of adventurers was formed, and admitted to a participation in its rights and privileges. This body was destined before the lapse of a century to acquire and consolidate a larger and more powerful empire than had ever been governed by the Moguls in India. Other European trading companies beside the English and Portuguese had also obtained a footing in India. The Dutch, after their emancipation from the Spanish dominion, had applied all their energies to foreign commerce and to the formation of foreign settlements. In this they had been eminently successful. The French under the fostering care of Colbert sent out adventurers, and opened a direct trade with the Indies. All these European settlements entertained the deepest jealousy of each other, and self-defence, both from each other and from the native power, compelled them to keep up some degree of military force. The Portuguese indeed were under the dominion of a viceroy, who surrounded himself with all the pomp and state of a native prince. In 1715 a deputation went from the English company to the court of Delhi in reference to some concessions. It happened that the emperor Feroksheer, the great grandson of Aurungzebe, was seized with a severe illness. Dr. Hamilton, a physician to the company, cured the emperor of his malady, which had baffled the skill, or rather ignorance, of the court physician. In gratitude the emperor, at Dr. Hamilton's request, granted permission to the company to purchase 87 townships in Bengal, beside other valuable privileges which laid the foundation of Calcutta's future greatness. On the death of Aurungzebe in 1707, after a reign of 48 years, during which he had brought the whole peninsula under his power, the affairs of the empire had rapidly fallen into confusion. The Mahrattas attained great power. The various rajahs became virtually independent, acknowledging only a nominal allegiance to Delhi. The disorders which the firm hand of the

Mogul emperor had suppressed, reappeared, and the vast territory was torn to pieces by internal dissensions. The position of affairs in India in 1750 is thus described by an eloquent living writer: "A series of nominal sovereigns, sunk in indolence and debauchery, sauntered away life in secluded palaces, chewing bang, fondling concubines, and listening to buffoons. A series of ferocious invaders had descended through the western passes, to prey on the defenceless wealth of Hindostan. A Persian conqueror crossed the Indus, marched through the gates of Delhi, and bore away in triumph those treasures of which the magnificence had astounded Roe and Bernier; the peacock throne on which the richest jewels of Golconda had been disposed by the most skilful hands of Europe, and among others the inestimable 'mountain of light.' The Afghan soon followed to complete the work of devastation which the Persian had begun. The warlike tribes of Rajpoots threw off the Mussulman yoke. A band of mercenary soldiers occupied Rohilound. The Sikhs ruled on the Indus. The Jauts spread terror along the Jumnah. The high lands which border on the sea-coast of India poured forth a yet more formidable race—a race which was long the terror of every native power, and which yielded only after many desperate and doubtful struggles to the fortune and genius of England. It was under the reign of Aurungzebe that this wild class of plunderers first descended from the mountains; and soon after his death every corner of his wide empire learned to tremble at the mighty name of the Mahrattas. Many fertile viceroyalties were entirely subdued by them. Their dominions stretched across the peninsula from sea to sea. Their captains reigned at Poona, at Gualior, in Guzerat, in Berar, and in Tanjore. Nor did they, though they had become great sovereigns, therefore cease to be freebooters. They still retained the predatory habits of their forefathers. Every region that was not subject to their rule was wasted by their incursions." In 1746, war having broken out between England and France, Labourdonnais, the French governor of the Mauritius, conducted an expedition against Madras, the chief British settlement in India, which capitulated on the understanding that it should be ransomed. Dupleix, governor of the French settlement of Pondicherry, had other views. He had conceived the ambitious scheme of consolidating the states of Hindostan into one mighty empire, of which he himself should be the prime head and governor. This scheme involved the destruction of the British settlements, and accordingly at the instigation of the natives secretly promoted by himself, he removed the English authorities and proceeded to carry his great schemes into accomplishment, always under the excuse of supporting a native local interest. The first movements of the French and their native allies were completely successful. English interests were on the verge

of ruin when the daring courage and military genius of Robert Clive saved the settlements with a couple of hundred Europeans and 800 Sepoys. He attacked and carried the city of Arcot, which he held against the utmost efforts of the allies. Dupleix was not a soldier. The management of operations in the field was left to native commanders. Clive, who though tied to the civil service, was, as a contemporary said, "born a soldier," compelled his assailants to raise the siege. This decided the fate of India. Once launched on the tide of victory, the policy of merest expediency prevented the company from retracing their steps or refusing the advantage proffered by circumstances. In a few years the French power was annihilated, and by the year 1760 a partnership of traders in England had subdued the finest provinces of Bengal, Bahar, and part of Orissa, abounding in manufacturing towns possessed of an immense population and yielding a magnificent revenue. From that time the limits of the British empire in India have gone on steadily, increasing with but few reverses. Hyemali, Tippoo Saib, and the Mahrattas, were the great enemies which they had to meet in the field. The battles of Plassey and Assaye told the superiority of European discipline against irregular forces, however brave.—Turning from the progress of European power in southern Asia, we direct our attention to the north. We have already seen that on the first invasion of the Mongols, the Russians were placed under tribute to the Golden Horde. After Ivan the Terrible had rescued the nation from this disgraceful servitude, it happened that a Cossack chief, Jermack, having been arrested and condemned to death for his crimes, offered, if released, to extend the dominion of Russia into Asia. The conditions were accepted, and Jermack, at the head of his Cossacks, invaded Siberia, and in a battle fought near Tobolok established himself, and gradually brought all northern Asia under Russian supremacy. The comprehensive intellect of Peter the Great saw the means of extending Russian influence. He navigated the Volga, and appreciated the uses to which the Caspian might be applied in Russian relations with central Asia. An alliance was formed with the shah of Persia, and in 1722 Peter led an army through the passes of the Caucasus to the assistance of the shah, against the Afghan invaders. The footing once obtained in central Asia by the Russians has never been relinquished. By open war or under the still more dangerous mask of friendship, the court of Russia has maintained its grasp on the feeble court of Teheran. A plot was even concocted with Turkey, the hereditary enemy of Persia, for the dismemberment of the Persian kingdom, but this was defeated by the sudden vigor and energy of the usurper, Nadir Shah, who for a brief space restored the waning glories of the Persian name, and passing the Indus pursued a career of conquest as far as Delhi. During the return of his army laden

with plunder, he was murdered by some mutineers, and again the Persian empire was dismembered,—Afghanistan being erected into an independent kingdom, by Ahmed, one of Nadir's followers. During the first quarter of the present century the Mahratta war in India occupied British attention. On the conclusion of this the consolidation of the empire by the remodelling of native governments was successfully carried on. In the second quarter the war with China, Afghanistan, and Sind, has taken place, and vast extension of territory has resulted. Important changes will no doubt follow upon the suppression of the great Bengal rebellion of 1857, which is not yet concluded as this article goes to press.—In northern and central Asia the Russians have been occupied during the present century in organizing the details of their government, and fortifying their influence over the native tribes, especially in Persia and in Mantchooria, where they have lately taken possession of the valley of the Amoor. Permanent routes of communication have been established between Europe and Asia, both by land and water. The intelligence which was formerly communicated from Europe to China in 6 months, more frequently a year, is now regularly transmitted every fortnight and occupies 2 months, while the abolition of the exclusive trading privileges of the East India company, has opened the whole south of Asia to the commerce of the world, in which the United States has been found a formidable competitor. The political distribution of Asia is precisely what might have been expected from the configuration of the surface, and the natural barriers to internal communication. The same general political outlines which have obtained for unknown centuries, still obtain—dynasties have risen and fallen, conquerors have appeared and disappeared, like fiery exhalations, but the general political divisions, stamped by nature and retained by the unalterable character of the people, still remain. The drainage areas, the plains and lowlands, the climatology, which we have passed in brief review, have determined the permanent kingdoms and empires of Asia, and have affixed to them that character of durability which, contrasted with the mobility and restlessness of the West, seems to endure all things eastern with a perennial and unalterable character. The Russian, Chinese, Indian, Turkish, and Persian dominions, occupy the mass of Asia. Turkey and Persia divide the western plateaus of Iran and Arabia. The Indian empire occupies the plains and uplands of Hind, south of the Himalaya and Hindoo Koosh. The Chinese dominions include the alluvial lands of China proper, with a part of the eastern plateau, while Russia rules over the Siberian lowlands and a great part of the Mantchoo tribes. Central Asia is under no government worthy of being so called. Of the roving tribes, the Kirgheez Tartars are in process of absorption by the Russians. The

Mongols acknowledge a limited allegiance to China. Thibet, under its peculiar priest-government, is also under nominal subjection to the Chinese. The only really independent sovereign in independent Tartary is the savage and sanguinary despot of Bokhara. The peninsula of Indo-China is divided into the kingdoms of Burmah and Siam. The political influences of Asia are balanced by British supremacy in the south, and Russian in the north. The 2 great powers have long antagonized each other at the court of Persia, the key to central Asia and northern India. The deserts of Khiva, long thought impassable, have been traversed by the untiring perseverance of Russian generals; and a permanent footing has been obtained for Russia in the provinces to the south of the Caspian, and in eastern Persia by treaty concluded in 1857. In China, too, Russian influence is greater than that of any other nation. The Chinese voluntarily exclude themselves from interest in Asiatic politics; but internal wars in that kingdom may yet produce a renewal of those tremendous movements which we have seen affect the remotest borders of Europe. In the west, Turkey holds nominal power over Arabia; but so entirely nominal is it, that she cannot protect the caravans of pilgrims to Mecca without the aid of the viceroy of Egypt. Her influence, therefore, in Asiatic affairs, is a cypher. The empire of the east, with all its concatenation of high interests to mankind, lies between Great Britain and Russia.

ASIA MINOR. See ANATOLIA.

ASIATIC SOCIETIES. See SOCIETY.

ASIMAGOMY, a large lake in Upper Canada, in lat. 48° 35' N. long. 85° 30'; length 12 miles; average breadth 8 miles; it discharges into Lake Superior.

ASINARI, FEDERICO, conte de Camerano, an Italian warrior and poet, a native of Asti in Piedmont, flourished in the middle of the 16th century. His tragedy *Il Tancredi* is considered one of the best Italian tragedies. It was first published under the title of *Gismunda*, and erroneously attributed to Torquato Tasso.

ASIOLI, BONIFAZIO, an Italian composer of music, born at Correggio about the year 1769. As a boy he was precocious, and at 8 years of age composed without instruction. In 1799, after a successful career in Turin, Venice, and other Italian cities, he established himself in Milan, as musical director to the viceroy, and remained there for about 14 years. He was a good melodist.

ASIRMINTAR, an active volcano, in the island of Onekotan, one of the most northerly of the Koorile islands, lat. 49° 40' N. long. 155° 8' E.

ASKELOF, JOHAN KRISTOFER, a Swedish journalist, born in 1787, began life as employee in the public service, after having graduated as doctor of philosophy at the university of Lund. In the *Polyphem*, a weekly paper, which he founded in 1809, and conducted till 1812,

he opposed the Gallic tendency of the so-called classical or academical school, and thus contributed in some measure to nationalize Swedish literature. From 1812 to 1821 we find him engaged in various capacities in the service of Sweden. His last achievement in the latter year in connection with a convoy of corn to Italy failed to give satisfaction. He was connected with journalism in 1815 and 1816 as editor of the *Lifvet och Döden*, and in the subsequent year as conductor of a political periodical, in which he had Count Schwerin, and other eminent public men for collaborators. His editorial fame was, however, chiefly due to his conduct of a partisan journal, known since 1829 under the name of *Soenska Minerva*, which, owing to his intimacy with the members of the Swedish cabinet, contained accurate and trustworthy accounts of the ministerial movements, and of political affairs generally. In 1840, however, when a new ministry uncongenial to Askelöf's royalistic partisanship came into office, his paper lost its official flavor.

ASKEW, *ANNA*, whose name is sometimes spelled *Ascouer*, or *Ascuz*, an English Protestant lady, who was burned at Smithfield, July 16, 1546. She was a native of Lincolnshire, and with superior intellectual culture, had read and studied the Scriptures, and espoused the reformed opinions. Her husband, named Kyme, was a strong Catholic, and turned her out of doors. She went to London to sue for a separation, and attracted the sympathy of the queen, Catharine Parr, and many of the court ladies. Her denial of the corporeal presence of Christ's body in the eucharist caused her arrest and committal to prison. When examined before the lord chancellor Wriothesley, Bonner, bishop of London, and the lord-mayor of that city, she was asked, Whether the priests cannot make the body of Christ? She answered, "I have read that God made man, but that man can make God I have never yet read." Yet Burnet says, that after much pains she signed a recantation acknowledging that the natural body of Christ was present in the sacrament after the consecration, whether the officiating priest were a man of holy or of evil life. Her recantation did not save her. She was recommitted to Newgate, and asked to disclose who were her correspondents at court. She refused to reply, and was racked in the presence of the lord chancellor, but would disclose nothing. Her fortitude probably saved the life of the queen. As she was not able to stand after the torture she was carried in a chair to the stake, and suffered along with four others. She underwent this last trial with the same courage as the former.

ASLAN, or *ASCHANI*, or *ASLANI*, the name given to the Dutch dollar in most parts of the Levant. The word is of Turkish origin and signifies a lion, which is the figure stamped on this coin.

ASMANNSHAUSEN, a village on the Rhine in the duchy of Nassau, and in the borough of

Rüdesheim, of 600 inhabitants. It is famous for the wine of Asmannshausen, one of the best red Rhenish wines. Some judges prefer it to Burgundy. Its value lasts only 8 or 4 years.

ASMODÆUS, or *ASMODI*, in Hebrew an evil demon, who is mentioned in the later Jewish writers. In the book of Tobit he is described as murdering the 7 husbands of Sarah, one after the other. In consequence of this he has been facetiously termed the evil spirit of marriage, or the demon of divorce. In the Talmud he is called the prince of devils, and is said to have driven King Solomon out of his kingdom. Tobit got rid of him by prayer and fasting. Asmodæus is the hero of Le Sage's novel *Le diable boiteux*.

ASMONEANS, a family of kings who reigned over the Jews 126 years. From the hands of the Ptolemies Judæa passed (198 B. C.) under the rule of the Syrian kings, in the person of Antiochus the Great. At his death the government fell into the hands of his son, Antiochus Epiphanes. The intrigues for the office of the high-priesthood (in consequence of the political power attached to it by the elder Antiochus, who had made the high priest procurator of the province) resulted in a popular insurrection. This so incensed Antiochus Epiphanes, that he resolved on crushing this politico-religious importance of the Jewish province. He therefore not only put down the insurrection with great slaughter, but, as a more complete demolition of the insurrectionary cause, ordered that the Jews should change their monotheistic worship and address supplications and offer sacrifices to Jupiter Olympus, whose statue he had caused to be set up on the altar in the temple. This offence to the religious sentiments of the people was too great, and a violent popular resistance, headed by Mattathias, great grandson of Asmoneus, was the result. Here is the beginning of the Asmonean dynasty, though, in the person of Mattathias and his 4 elder sons, it is styled the Maccabæan dynasty, while the Asmonean proper is considered as commencing in Jonathan, his 5th son, because under him first, in consequence of an alliance with Rome, did the province of Judæa enjoy an established independence of the Syrian power. The Asmonean authority descended through a succession of kings, who ruled with greater or less success, to Hyrcanus II. He was supplanted by Herod the Great, who had so ingratiated himself into the favor of Cæsar, that he received the appointment to Judæa as a Roman province. At once to pacify and destroy the Asmonean dynasty, he married Mariamne, the granddaughter of Hyrcanus, and appointed Aristobulus III., who would have been the Asmonean heir, high priest. Soon after, fearing the influence of Aristobulus, he caused him to be drowned, and so ended (35 B. C.) the Asmonean line, and Judæa passed under the Roman power. Josephus gives a lengthened account of this political period. It is also narrated in the apocryphal books of the

Maccabees. The Jews enjoyed much prosperity under the Asmonean reign.

ASOPUS, the god of the river Asopus in Peloponnesus, was a son of Oceanus, or Neptune. He was married to Metope, the daughter of another river-deity, by whom he had 2 sons and 20 daughters.

ASP, a name given to more than one species of the venomous serpents. By naturalists, it is confined to the *vipera aspis*, which is a native of the European Alps. The historical asp, with which Cleopatra is believed to have destroyed herself, after the death of Antony—

Delliberatâ morte ferocior,
Sævæ liburnis scilicet invadens
Privata deducti superbo,
Non humilis muller, triumpho—

is generally supposed to have been the *cerastes Hasselquistii*. From many circumstances, however, and more especially from the description of Pliny, it is evident that the asp of the Roman writers, generally—and it is, therefore, to be presumed the asp of Cleopatra—is the common and celebrated Egyptian species, the *naia haja*, *el haja*, *haja nascher*, of the modern Arabs. "This deadly reptile, which is a close congener of the terrible nâg of the Hindoos, *naia tripudians*, the cobradi capello of the Asiatic Portuguese, was chosen by the ancient Egyptians as the emblem of the good deity, *Cneph*, and as the mark of regal dignity. The front of the tiara of the majority of the statues of the Egyptian deities and kings, is adorned with this serpent, and Devon's figure, with the forepart erect and the wood expanded, represents it nearly as it appears on the sculptured stone." It is remarkable that the nâg is still worshipped in some of the temples in India, where the Hindoos believe that, in sagacity and the malicious tenacity with which this serpent treasures up a wrong to avenge it, it is in nowise inferior to a man. This would alone be enough to identify the sacred naia of Egypt with the sacred nâg of Hindostan; particularly when it is remembered that very strong reasons exist for believing the superstition of the ancient Egyptians and the modern Hindoos to be almost, if not identically, the same. In proof of which, it may be adduced that the Hindoos of Sir David Baird's army, who landed from the Persian gulf to coöperate with Abercrombie against Napoleon's lieutenants, when they beheld the colossal idols of the ruined Egyptian shrines at Tentyra and Thebes, acknowledged them for their own gods, and worshipped them. The description of Pliny, however, while it identifies the asp of the Roman writers unmistakably with the hooded *el haja*, is doubly curious as referring to the story of its tenacious memory and treasuring up of wrong; which belief has, therefore, continued unchanged since his day, perhaps since the day when the magicians of Pharaoh converted their serpents into rods before Moses—a trick resembling which is still played with this very asp, by the serpent-charmers of the present time, who have the

power of throwing it into a cataleptic state, during which it is as rigid and immovable as a wand. The passage of Pliny is as follows: "The neck of the asp is capable of distension, and the only remedy against the bite is the immediate amputation of the wounded part. This animal, otherwise so much to be dreaded, has a sentiment, or rather a kind of affection, truly wonderful. It never lives alone, the male and female being constantly found together; and if one happens to be killed, the other seeks with the utmost fury to avenge its death. It knows and selects the destroyer from among crowds, it follows him to great distances, surmounts every obstacle, and can only be deprived of its revenge by the most speedy flight, or the intervention of some rapid river." Nor will it be altogether well for modern philosophers, or for those moderns who deem it philosophy to deny whatsoever they do not understand, too much to ridicule the statement of the old naturalist. Not only because it is at least worth the while to investigate, before discussing, the truth of a story which has endured unchanged for nearly 18 centuries, and which exists, in the same form, in the most remote parts of the world, but because stories of old writers, long held in contempt as fables, have often been proved to be most true; and because—more pertinently—some strange facts have recently come to light concerning the manner in which serpents will instinctively find the way to the place where their mates have been killed, and of the unnatural affection which they retain for their carcasses. The *el haja*, *naia haja*, or *haja nascher*, is of a dark and greenish hue marked with brownish, is hooded like the cobra, when it expands itself in rage, but wants the peculiar mark on the back of the neck which characterizes the Asiatic species, and which has been compared to a pair of spectacles. It varies in length from 3 to 5 feet, and is one of the deadliest serpents known. The bite produces acute local pain in the first instance; then a sense of deadly sickness; after which the sufferer falls into a comatose state, with convulsive fits, each less violent than the preceding one. In the last of these he dies, usually not many minutes after being struck; although that must in some degree depend on the nature of the tissue wounded. Owing to the almost instantaneous dispersion of the poison through the blood, it is not believed that excision could be of the slightest utility; nor is there any certain antidote known, against the deadly fluid, when once introduced into the veins. When she was bent on dying, Cleopatra could scarcely have found a surer or more painless agent.

ASPARAGUS (Gr. *σπαργα*, to tear), a genus of perennial plants, deriving their name from the prickles with which some of its species are furnished, belonging to the natural order of the *liliaceæ*, to the sub-order of the *asparagææ*, and differing only in the fruit from the *asphodeleæ*. The genus is distinguished by tuberous root-stocks, branching stems, thread-

like leaves, jointed pedicels, a 6-parted perianth, small greenish-yellow or white flowers, and a spherical berry. It embraces 26 species, many of which become hardy shrubs, and climb with their spiny branches as if by tendrils. A few of them are common in the East Indies, and around the Mediterranean; most of them are rare and of little importance, and none are natives of this country. Of the wild species, the most widely spread are the *acutifolius* and the *albus*, the needle-leaved, and the white, the former of which is common in France, Spain, Barbary, and the Levant; the latter is found in the same countries, France excepted, and is remarkable for its white and flexuous boughs in the midst of its green and caducous leaves; and the young shoots of both of them are eaten by the Arabs and Moors. But much the best known member of the genus is the *officinalis*, the common or garden asparagus, esteemed as a delicate culinary herb from the time of the ancient Greeks, and now cultivated in nearly all the gardens of Europe and America. It is thought to be native both on the shores of England and in rocky and sterile districts in Europe and Asia, and when it has attained its full development, is an elegant plant, from 8 to 4 feet high, with numerous branches loaded with fine and delicate leaves, and covered with small, greenish-yellow, bell-shaped, and almost solitary flowers. The asparagus served upon the table is the young and tender shoots of the plant, cut when but a few inches from the ground, and prior to ramification. It loves a dry, deep, and powerfully manured soil, and is raised from seeds either planted in seed-beds in the spring and transplanted the next year, or planted at first where they are to remain. During the first 2 years the young heads should not be cut; half of them may be cut in the third, and after that the full crop. The supply will begin to diminish after 10 or 12 years. The beds for asparagus are usually about 4 feet broad, and should be manured and trenched at least 2½ feet deep. The plants are in rows about a foot apart, and are thinned out till they stand about 6 inches from each other in the row, and in growing, a cluster of heads branch from each root. The crop may be reaped as often as it appears, being cut from a little below the surface of the ground, yet the plant degenerates by being cut late in the season. The bed should be annually, in the autumn, replenished with manure, dug in between the rows as deeply as possible without injuring the roots, and covered with pulverized manure, sea-weed, or other litter during the winter, as a protection from the frost. Asparagus is easily forced by the use of hot-beds, but the process of transplanting always injures or destroys the roots, and if, instead of transplanting, the bed be covered and the trenches filled with hot dung, which mode is sufficient to forward the crop one or two weeks, care must be taken to give the plants time to rest, and recover in the later part of the season.

ASPASIA, born in Miletus, was a daughter of Axiochus, and one of the most celebrated women in the most brilliant times of Athens and Greece. She united to beauty and womanly grace a great and varied culture of mind, and was devoted to politics and oratory. Her house in Athens was the rendezvous of the most prominent and gifted men. Socrates visited her often, and in the dialogues of Plato, Socrates puts into the mouth of Aspasia the beautiful obituary speech made before Menexenus. It is said that she taught Pericles the art of oratory. A deep and unshaken love united both. When Pericles was surnamed the Olympian Zeus, Aspasia was called Hera. Finally, Pericles separated from his wife and espoused Aspasia. The enemies of Pericles, and above all Aristophanes, accused her of having instigated by her influence the war with the Samians and the Peloponnesian war. Plutarch denies this, and Thucydides does not mention her name in connection with the subject. The opponents of Pericles publicly accused Aspasia of contempt toward the gods. Pericles defended her before the judges and won her cause. He had a son by her, and after his death Aspasia married Lysicles, a cattle dealer, who, by her influence, soon became a very eminent man in Athens. In antiquity her name was used to describe the most charming women. But as in Athens foreign born women were almost outlawed, and their children, even if born in lawful marriage, were considered as illegitimate, Aspasia is often included in the number of celebrated courtesans.

ASPASIE (CARLEMIOELLI), born in 1772, executed in 1795, one of the most terrible of the terrible women of the French reign of terror. She was believed to have been in a lunatic asylum, almost from her childhood up to the time of the outbreak of the revolution, when she effected her escape and took an active part in the exciting events of the day. When a famine desolated Paris, and added its horrors to the other horrors of that blood-stained era, Aspasia had made up her mind that the scarcity was artificially produced, in order to starve the people. She yearned for vengeance, and, after having made several ineffectual attempts to assassinate Boissy d'Anglas, the temporary president of the convention, whom she supposed to be the author of the famine, she put herself, on the 1st Prairial, 1796, brandishing a knife in her hand, at the head of the infuriated women who invaded the hall of the convention. They fired upon the deputy Féraud, and as he made an effort to raise himself from the ground upon which he had been thrown by the ball, Aspasia rushed ferociously upon the unfortunate man, smashing his head with her wooden shoes, the savage shouts and frantic cheers of the other women making the bewildering excitement of the fiendish scene perfectly appalling. She next pounced with her knife upon Camboulas, whose escape from her murderous attack was almost miraculous. She was arrested, sentenced, and

executed on the guillotine on the 24th Prairial, 1795. She obstinately refused to disclose the name of any of the other women, never lost even for a single moment her proud, cool self-possession, and expressed to the last her regret that Boissy d'Anglas and Cambouas had escaped with their lives. The facts of her life, as recorded by history, do not reveal any thing to warrant the plea of insanity, which was set up upon the popular belief that she had been an inmate of a lunatic asylum. She comes before us as a fanatical woman, whose passions being wrought up to the highest pitch by the excitement of the times, degenerated into a sanguinary fury. She was only 28 at the time of her death.

ASPECT, an astrological term, occasionally used in astronomy, defined by Kepler as "the angle formed by the rays of two stars meeting on the earth, whereby their good or bad influence is measured."

ASPEN, a species of the great genus *populus* (*arbor populi*), being planted in public places by the Romans) or poplar, of the family *amentaceæ* (katkin-bearers) Juss., *diaccia octandria* L. ament cylindric, scales lacerate, perianth turbinate, oblique, entire, anthers 8 to 30; female flower; stigma 4 cleft, capsule superior, 2 celled, 2 valved, many-seeded; seeds pappous. The aspen belongs to Lindley's order *salicaceæ* (willow). Of about 40 species of *populus*, belonging to Europe and North America, the aspen furnishes 3, viz.: *P. tremula*, leaf-lobes much developed, teeth distant, smooth on both sides, petioles long, vertically compressed, hence trembling in the faintest breeze; bark gray or greenish; roots trailing in long shoots; easily propagated, especially in sandy soil; wood white, soft, employed for small utensils, burning rapidly with little heat; the bark contains tannin; indigenous in Europe. *P. tremuloides*, indigenous in North America; resembles the preceding, but its leaves are smaller, suborbiculate, abruptly acuminate, serrulate, pubescent, and glandulous at the margin; wood light, used sometimes for summer hats; west of the Mississippi in scanty groups, in narrow valleys, near springs, it is smaller than in the north and middle states, where it grows to about 20 feet. *P. grandidentata* (the American large aspen), leaves oval-acuminate, unequally and sinuously great-toothed, almost glandless, smooth on both sides, villous when young; bark smooth, greenish, unbroken; rare in the middle states. All species of *populus* contain more or less of the febrifuge alkaloid called salicine. The buds of many are coated over with a balsamic resinous matter, especially the *P. balsamifera* or *tacamahaca* of Siberia and Canada, and *candicans* (balm of Gilead).

ASPERN and Essling, a town and village on the north side of the Danube, the former about half a league, the latter about 2 leagues below Vienna, situated on the great meadowy plain of the Marchfeld, extending from the river to the wooded mountain heights of the

Bisamberg, celebrated for the 2 days' terrible fighting between the French and Austrians, on May 21 and 22, 1809, and the first defeat of the emperor Napoleon, who was here beaten and forced to retreat by the archduke Charles.—In the early part of the campaign, Napoleon, with the grand army, had made his way through the Tyrol, up the rivers Inn and Isar; had defeated the archduke at Eckmühl; forced him across the Danube, into the mountains of Bohemia, at Ratisbon, which he took by assault, thus interposing between the Austrian army and capital; and then, detaching Davoust with 40,000 men to amuse the imperial general, had descended the Danube, and made himself master of Vienna; while from the Italian side his lieutenants, Eugene Beauharnois, and Macdonald, were advancing victoriously through Dalmatia, Carniola, and up the valley of the Muhr, in which Jellachich was severely defeated, to join their commander. In the mean time, the archduke Charles, who since his defeat at Eckmühl had been moving slowly down the river, on the northern side, hoping for an opportunity to fight at advantage and rescue the empire under the walls of the capital itself, took post with his army on the Bisamberg, over against the island of Lobau, and another smaller islet, which here divide the Danube into 4 channels.—The archduke was at the head of 100,000 men, and was in hourly expectation of being joined by his brother, the archduke John, with 40,000 more, which would have been raised to 60,000, had that prince effected his junction, as he was explicitly ordered to do, with Kolowrat at Lintz, and which would have occupied a most commanding position in the rear of Napoleon, and on the principal line of his communications.—It was Napoleon's object, who had concentrated under his own orders 80,000 admirable soldiers ready to take the field, including the imperial guard and the reserve cavalry of Bessières, to cross the Danube and give battle to the archduke, in the hope of crushing him before the arrival of his reinforcements. To this intent, he bridged the river from the right bank to the island of Lobau, with a structure of most solid materials, supported on 68 large boats and 9 huge rafts, and from Lobau to the Marchfeld, midway between the villages of Aspern and Essling, with a slighter fabric of pontoons; and on the morning of the 21st began to pass his troops across, with the utmost alacrity and diligence. The Austrian commander, from his mountain position, perceived the rashness of the manoeuvre, by which the emperor was pushing his vast host across a wide and rapid river, by means of a single bridge, which could only admit of a slow and gradual defiling of the men of all arms, over its long and narrow causeway, difficult to cavalry, yet more difficult to artillery; and which, in case of his being forced to retreat, scarcely offered a possibility of saving the army; and perceiving it, resolved at once to avail himself of the opportunity of crushing half the French host on

the northern bank, while the rest of the army was either in the act of passing, or on the southern side. Sending orders to Kolowrat, Nordman, and the other officers in command up the river, to prepare boats laden with heavy materials and combustibles for the destruction of the bridges, when the time should arrive, the archduke kept his great army out of sight, ordering his cavalry and outposts only to make a nominal resistance, and then to fall back before the advance of the French, which was led by Massena; until at 12 o'clock the movement of the enemy was sufficiently developed, above 40,000 French being already on the northern shore—to justify his assuming the initiative.—At that hour, descending from the wooded heights of the Bisamberg, with 80,000 men, of whom 14,000 were splendid cavalry, and 288 cannons, he precipitated himself upon the enemy, making the 2 villages of Aspern and Essling, on Napoleon's flanks, the principal points of his attack; the central space between these 2 strong places, which were built of stone, with garden walls and many enclosures, was occupied by the tremendous Austrian batteries, guarded chiefly by cavalry, with Hohenzollern's infantry in reserve in the rear. The fighting on both the flank attacks was terrific, and the fury of the assaults and obstinacy of the defence almost unparalleled in the history of war. Both villages were taken and retaken several times, and so terribly did the Austrian artillery devastate the French lines, that Napoleon ordered a grand charge of cavalry to take the batteries, if possible. The superb French cuirassiers of the guard charged with their usual impetuous valor, routed the Austrian horse, and would have carried the guns, but that they were hastily withdrawn, and the infantry formed in squares, which, as at Waterloo afterward, defied all attempts to break their impenetrable formation, and at last defeated the horse, and compelled them to retire, shattered and decimated, into their own lines. In the mean time, Aspern was taken by the imperialists, their centre was gradually but irresistibly gaining ground, in spite of the gallant devotion of the cuirassiers, who charged again and again with constantly diminishing numbers, and who alone prevented the French lines from being broken through.—Night brought a brief cessation of the strife; but the French had suffered a decided defeat in a pitched battle; their left flank was turned, their centre forced back almost to the bridges; and although Essling, on their right, had been defended by the gallantry of Lannes, it was surrounded by the Austrians, who slept on their arms among the French dead, waiting only the return of light to renew their offensive operations.—During the whole night, however, fresh forces were defiling across the bridges, and debouching upon the Marchfeld, and at daybreak, after all the losses of the preceding day, Napoleon had full 70,000 men in line, while Davoust was beginning to cross over at the head of 80,000 more. The battle began

by renewed attacks on the two disputed villages; Essling was carried by the imperialists, and Aspern retaken by the French. Both villages were the scene of desperate fighting all day long, and both were taken and retaken several times with the bayonet, but at last remained in the hands of the Austrians, who, in the evening, advanced their artillery beyond both places, and actually crossed their fire upon the rear of the French. But during these bloody conflicts, Napoleon, who was relieved by his vast accession of forces from the necessity of acting on the defensive, had recourse to his favorite manœuvre of an overwhelming attack on the centre. At the head of a huge column of above 20,000 infantry, with 200 cannon preceding them, and a tremendous cavalry force in their rear, he launched Lannes and Oudinot directly on the Austrian centre, where the lines appeared the weakest, between the left of Hohenzollern and the right of Rosenberg. At first, this tremendous attack seemed to be perfectly successful; the Austrian lines were forced; a huge gap made between Rosenberg and Hohenzollern, into which the cavalry burst with appalling fury, and cut their way clear through to the reserves of the prince of Reuss, far in the rear; and already the cry went abroad, that the battle was lost; but the archduke Charles was equal to the emergency; the reserve grenadiers were brought up at double quick time, and formed in a checker of squares; the numerous dragoons of prince Lichtenstein came galloping up behind them, and, with the colors of Zach's corps in his own hand, the gallant prince restored the battle.—The terrific column of Lannes could advance no further, but halting, began to exchange volleys with the squares, and, unable to deploy, was crushed by the concentrated fire of the batteries, playing on it at half musket shot. In vain the cavalry charged home on the bayonets of the squares, for not a square wavered or was broken; and, at length, the Austrian dragoons of the reserve, coming up with loud shouts, charged the cuirassiers in their turn, routed them, and drove them in confusion back upon their infantry, and completed the disorder. Immediately after this repulse, Hohenzollern broke through the French lines on the right of the centre with 6 Hungarian regiments of grenadiers, and carried all before him, even to the rear of Essling, which, with Aspern, were both carried finally by the imperialists. From these villages, as the Austrian centre was now driving all before it, in spite of the unparalleled exertions of the French army, which was now in full retreat to the island of Lobau, the Austrian batteries crossed their fire, with fatal effect, on the bridges, every shot telling on the crowded masses of men and horses.—Meanwhile, to augment the perils of the French, the bridge connecting the island with the southern shore was broken by the Austrian fireboats and rafts, and all escape from the island was rendered, for the moment, impossible. Still, with

unexampled firmness the rear-guard of the French held the Austrians in check, until, at midnight, the last of the enemy having withdrawn from the field of battle into the island, the thunder of the Austrian batteries ceased, and the exhausted artillerymen fell asleep beside their guns, worn out by the fatigues of that unparalleled and glorious day.—Seven thousand French were buried on the field of battle by the victors; 29,798 were carried, wounded and prisoners, into Vienna. Lannes and St. Hilaire were mortally wounded, and died a few days afterward. On the side of the imperialists, 87 superior officers, and 4,200 privates, were killed; beside 16,800 wounded. But the victory, gained under the very walls, and almost within sight of the capital, was complete; the enemy, broken, defeated, and dispirited, were cooped up in the narrow limits of the island of Lobau, and, had the archduke John, in obedience to his orders, made his appearance in the rear of the French with 60,000 fresh men, on the morning following the defeat of Aspern, it were difficult to say what might not have been the result.—But Napoleon's time had not yet arrived, and the nations were yet doomed to suffer 4 years longer, before the final downfall of the military colossus should restore them to their lost freedom, by the fields of Leipsic and Waterloo.

ASPHALTITES. See DEAD SEA.

ASPHALTUM, also called mineral pitch, compact bitumen, and Jews' pitch, the last name given it from its abundance in the lake Asphaltites or Dead sea of Judæa. It is one of the series of substances resulting from the changes which vegetable matters buried in the earth have undergone. It is more bituminous than the coals, and when pure is of the consistence of resin—but this varies with the temperature and with the amount of liquid bitumen or petroleum, which may be mixed with it, holding the more solid asphaltum in solution. It is, moreover, often intermixed with stony substances, and is even known to contain 80 per cent. of carbonate of lime. Pure asphaltum is insoluble in water, alcohol dissolves out of it about 5 per cent. of a resinous substance, and ether takes up 20 per cent. of another resin, that is not affected by the alcohol. It yields also a volatile oil. The remainder is a substance named by M. Boussingault, *asphaltene*, the composition of which is C_{20}, H_{16}, O_3 . Asphaltum burns readily with a red smoky flame, and leaves no ashes except those due to its impurities. It is but little if at all heavier than water; its color is black and dark brown, and does not soil the fingers. It melts at a temperature of boiling water, and consequently is unfit for use as fuel, and cannot be economically used for gas. Most of the geological formations contain it, but it is particularly common in the secondary and tertiary calcareous and sandy strata. In the primary rocks it is found only in small veins. It is obtained in large quantities on the shores of the Dead sea, in

Judæa, and is found floating upon its heavy saline waters. In the West India islands it is often met with, but most frequently the bitumen is in the liquid form called petroleum. The ancients made much use of this substance as a cement, and many varieties of it are well adapted for this use. The walls of Babylon were built with it. It was also used in embalming, probably dissolved in naphtha and injected into the hollow parts of the body. At present it is employed with sand and gravel for making pavements and roofs impervious to water; and also as an ingredient for the varnishes, called japans. Dr. Ure recommends it very highly for concrete for walks—but its want of uniformity of composition and uncertain supply in this country will probably prevent its taking the place of coal-tar, which though very likely inferior to some qualities of asphaltum, is adapted to most of its uses. The subject is further treated under BITUMEN. A patent for making a lubricating oil from asphaltum, like that obtained from the pitch lake of Trinidad, has recently been obtained in England by Dr. Simpson (who first applied chloroform as an anæsthetic agent), of Edinburgh and Prof. W. Thompson, of Belfast. The asphaltum according to the invention is first distilled at a temperature a little below that of a red heat. This produces a thick liquid, which is again distilled at the same temperature. The second distillation brings over a more limpid liquid—a fine residuum of charcoal being left in the retort. This oily liquid is subjected to stirring or agitation in a wooden vessel with about one-tenth of its bulk of sulphuric acid. A large proportion of the impurities unites with the acid, and when allowed to settle, falls to the bottom of the vessel. The clear liquid is then drawn off, and agitated with a caustic alkali or mixture of quicklime and chalk, allowed to settle and the clear drawn off. The resultant oil is then agitated with sulphuric acid as before, and again with the alkali or chalk, allowing time after each operation for the impurities to settle. When the oil has become a pale yellow color, it is put into an iron retort and distilled at a moderate heat, and about one-third of the quantity comes over as naphtha. The heat is then elevated, when the remainder comes over (leaving but a small residuum of charcoal), and is an oil nearly limpid. It is not equal to many other oils for lubrication, but one part of sperm oil mixed with nine parts of it makes a cheap and good oil for machinery. As vast quantities of oil are now employed for lubrication, and as the demand for it must increase with the progress of machinery of all kinds, a knowledge of every new source from which a supply can be obtained is of no small importance.

ASPHALTUM, ARTIFICIAL, a preparation of coal tar boiled to expel the volatile oils, which hold it in solution, and the water it contains. This is then mixed, in its condition of boiling pitch, with broken stones (limestone is the best), and finally it is run into moulds

upon a large table, which is divided into compartments to give it the form of blocks; or it is applied at once to its use as a covering for roofs, bridges, &c. The volatile oils may be collected and saved, but they are commonly allowed to escape. Two barrels hold about 1,000 pounds of tar; and in boiling this quantity one-fourth, or 250 pounds, is lost, of which about 210 pounds is essential oil, and 50 pounds is water. The remainder is fatty pitch. As the oils are valuable for the preparation of varnishes and lamp-black, and lubricating machinery, and may be used for adding to the illuminating power of gas by passing it over their surface, it seems that more attention might well be given to its preservation. The use of asphaltum for cement will be found more fully treated of under the head of BITUMEN.

ASPHODEL (*asphodelus*), a genus of perennial plants embracing several ornamental species, belonging to the natural order *liliaceae*, and to the sub-order *asphodeleae*. The name is of Greek derivation, implying the peerless or king-like flower, and the asphodels have long been among the favorite ornaments of the garden. They are all natives of the old world, and are found abundantly in the sunny districts of Greece, Sicily, Asia, and Barbary. The genus comprises 12 species, all of which have a bulbous root, erect undivided stem, long leaves, and showy flowers arranged in clusters, which in most of the species are spikes. The *luteus*, or common yellow species, is an old inhabitant of European gardens, into which it was introduced from the shores of the Mediterranean. It is branchless, about 2½ feet in height, has scattered, and almost piliform leaves sheathing the stock, and flowers of a beautiful golden yellow. It blossoms during 6 weeks in mid-summer. The *ramosus*, or white and branched asphodel, has a naked stem with ramifications near the summit, each of which is terminated by a spike of white star-shaped flowers having their petals streaked with purple. This is the famous herb which Homer describes as growing in the meads of Elysium. The ancients had a superstition that the manes of the dead were nourished upon its roots, and they therefore planted it in the neighborhood of sepulchres, and made it sacred to Proserpine. It still covers the hills and valleys of old Apulia, where it furnishes nourishment to the sheep. The *albus*, or upright asphodel, differs from the preceding by having a branchless stem, and also by having its flowers a little smaller and nearer together. The other species of asphodel are much less frequently cultivated in gardens than the 3 preceding.

ASPHYXIA (Gr. *ασφυξία*, formed of the privative *α*, and *σφυξίς*, pulse), a temporary or a final suspension of the motion of the heart, and the pulsation of the arteries. The word is commonly applied to suffocation, or the cessation of breathing, irrespective of the motion of the heart, which may continue some time after respiration ceases.—Respiration

and pulsation are, however, so intimately connected with each other in the continuance of life, and in the most approved methods of restoring animation after temporary suffocation by hanging, drowning, freezing, inhaling noxious vapors, and by other accidental causes of asphyxia, that no real inconvenience occurs from the apparent misapplication of the words cessation of the pulse, to the more prominent correlative, suspended respiration.—The prompt and most appropriate means of restoring life, in cases of temporary asphyxia, have called forth some most excellent remarks from learned men, of late, and caused the modes of treatment formerly adopted to be modified with much advantage. Not to dwell on by-gone methods, we may give at once an outline of the scientific views of Dr. Marshall Hall, with his remarks on the customary modes of treatment, and his reasons for supplanting them. The method he proposes is termed the "Ready Method in Asphyxia," because no apparatus of any kind is required. "The main indications are to renew inspiration, and improve the circulation; the means are physiological, and physical. All obstructions of the glottis being removed by placing the patient in the prone position, *i. e.* with the face to the ground, in which position any fluids and the tongue itself fall forward, our first effort is to excite respiration, physiologically; should this fail, our second is to imitate the acts of respiration, mechanically. Our next object is to endeavor to improve the circulation, which is done by promoting the flow of the venous blood, and to restore warmth in the limbs. Here, again, as we proceed, we must revert to the physiological principle of exciting respiration from time to time. All these indications are effected by the following short rules:

1. Treat the patient instantly, on the spot, in the open air, freely exposing the face, neck, and chest, to the breeze, except in very severe weather.

2. Send with all speed for medical aid and for articles of clothing, blankets, &c.

I. To clear the throat.

3. Place the patient gently on the face, with one wrist under the forehead. (All fluids, and the tongue itself, then fall forward, and leave the entrance into the windpipe free.)

II. To excite respiration.

4. Turn the patient slightly on his side; apply snuff, or other irritant to the nostrils; and dash cold water on the face, previously rubbed briskly until it is warm.

If there be no success, lose no time, but apply the 3d rule.

III. To imitate respiration.

5. Replace the patient on his face.

6. Turn the body gently, but completely on the side, and a little beyond, and then on the face, alternately, repeating these measures deliberately, efficiently, and perseveringly, fifteen times in the minute, only. (This number of thoracic movements per minute agrees with the natural order of respiratory thoracic dilatations and contractions, corresponding with a slow movement of the heart, averaging something less than sixty pulsations per minute, and therefore merits due attention.) The rationale of the operation is this: When the patient reposes on the thorax, this cavity is compressed by the weight of the body, and expiration is promoted; when he is turned on the side, this pressure is removed, and inspiration is facilitated.

7. When the prone position is resumed, make equable but efficient pressure along the spine, removing it immediately before rotation on the side. (The first measure augments expiration, the second commences inspiration.)

IV. To induce circulation and warmth.

8. Continuing these measures, rub the limbs upward, with a firm pressure and with energy, using handkerchiefs, &c.

9. Replace the patient's wet clothing by such other covering as can be instantly procured, each bystander supplying a coat or waistcoat. Meanwhile, and from time to time, proceed to the fifth rule.

V. To excite inspiration.

10. Let the surface of the body be slapped briskly with the hand, or

11. Let cold water be dashed briskly on the surface, previously rubbed dry and warm.

The measures formerly recommended by the medical profession, and now rejected by those who agree with Dr. Marshall Hall, are, removal of the patient, as involving dangerous loss of time; the bellows, or any forcing instrument; and, the warm bath, as positively injurious; galvanism, and the inhaling of oxygen, as useless. "The inhalation of dilute pure ammonia has in it more of promise."—For the treatment of still-born children, excitement of the skin, the alternate cool and hot bath (the cool temperature being 60°, and the hot 100° of Fahrenheit), postural respiration, as explained above, and rubbing with pressure upwards, are the remedies approved by practical success. As many practitioners still think well of the warm bath, as a means of resuscitation, we cannot do better than give the rationale of the fatal tendency of the warm bath in asphyxia. There is a physiological relation between the circulation and the respiration, any deviation from which, in either direction, is of a fatal tendency. In the course of the systemic (not the pulmonary) circulation, carbonic acid is formed; in respiration, the oxygen necessary for the formation of this carbonic acid is supplied, and the carbonic acid, so formed, is evolved from the system.—The immediate baneful effects of the suspension of respiration arise from the privation of oxygen, and from the retention of the carbonic acid previously formed, which becomes a blood-poison. An animal placed in perfectly pure nitrogen or hydrogen gas dies instantly in violent convulsions. And this is doubtless owing to the privation of oxygen, for carbonic acid gas might be exhaled into nitrogen or hydrogen gas. But an animal dies also in air, consisting of such a proportion of carbonic acid with oxygen, as to prevent the evolution of carbonic acid from the blood, although the quantity of oxygen might be so great that a taper blown out, and burning only as a spark, would be instantly kindled into a flame.—If without producing effects so sudden as those here described, we change the relative proportion of the respiration and the circulation, morbid phenomena are produced special to each case. If the circulation be disproportionately augmented, carbonic acid is formed, and being morbidly retained, alighter convulsion and slower death ensue. If the respiration is unduly and disproportionately augmented, the animal is cooled, for mere pulmonary respiration is a cooling process, by the difference of temperature of this inspired and expired air; and in this case, also, the animal dies, but now from loss of temperature. This latter is the case in the asphyxiated patient, if the respiratory movements be unduly hastened, that is

disproportionately to the rapidity of the remaining circulation. On the other hand, if in the asphyxiated we excite the circulation, without simultaneously and proportionately inducing the respiratory movements, we destroy the patient by carbonic acid, formed in the course of that circulation, and uneliminated by respiration. This statement leads to the proper subject of these observations, *i. e.* the rationale of the injurious and fatal tendency of the warm bath, in asphyxia, for it is injurious, and has, doubtless, of itself, proved fatal in cases in which the patient, without it, would have spontaneously recovered. In such a case, it is surely not less essential to the progress of science, and the medical art, to remove error than to establish truth. Warmth is so obviously a stimulus, and a stimulus is so apparently required for a patient taken out of the cold water, in a state of asphyxia, that in recommending the warm bath, we seem to be addressing ourselves to the common sense of mankind, and it was a step in advance to entertain a doubt on the subject. But when we begin to experiment, we learn that an animal deprived of respiration by being submerged under water, lives longer in cool water than in warm water, and learn to consider whether, in fact, coolness is not more favorable to life in the asphyxiated from submersion, than warmth. We recall to mind, too, that animals bear abstraction of respiration in proportion to their coolness. The hibernant animals, and the batrachian tribes, will scarcely drown at all. If a kitten be first cooled, or if it be immersed in cool water, it will not drown so soon as it would do if submerged at its ordinary temperature, in water of the same temperature. These facts have been established by Edwards, Brown-Séquard, and Dr. Marshall Hall. Again, all have heard of the Grotta del Cane, at Naples. The poor dog is put into the carbonic acid, and taken out asphyxiated. It is plunged, not into a warm bath, but into the water of the adjoining Lago Agnano, and taken out, restored.

ASPINWALL, a town upon the island of Manzanilla, in Navy or Limon bay. On the N. E. point of the island there is a lighthouse in lat. 9° 28' 30" N. long. 79° 58' W. This place was originally founded by the Panama railroad company as their Atlantic depot, and received its name from Mr. Wm. H. Aspinwall, a New York merchant, who was one of the first projectors of the railroad. The people of New Grenada, to which state it belongs, have never recognized the name, by which it is exclusively known in the United States, but still persist in calling it Colon. The settlement of the town was first commenced in 1850, when the engineers and laborers arrived upon the island of Manzanilla for the purpose of making the preliminary survey for the railroad across the isthmus of Panama. It has gradually grown up into a town of considerable importance, with the progress of the great enterprise to which it is indebted for its origin, and now contains some 200 houses and

about 1,500 permanent inhabitants. Its trade is exclusively dependent upon the railroad, and most of its people are employed either as laborers or officials in connection with that enterprise. The buildings are chiefly hotels, for the accommodation of travellers across the isthmus, warehouses for the temporary deposit of goods in *transitu*, and depots and offices belonging to the railroad company. The shipping is composed of steamers plying between Aspinwall and New York, Aspinwall and Havana, Aspinwall and New Orleans, engaged in the California trade, and the English West India mail steamers, which stop at Aspinwall in the course of their route to and from the gulf of Mexico, the West Indies and England. In addition to these steamers there are occasional small rigged vessels used for the trifling local trade of the place. The island of Manzanilla, upon which Aspinwall is built, lies on the east of Navy or Limon bay, near its opening from the sea. It is this bay which forms the harbors of the town, the chief one of which is on the west, where the largest ships can anchor within a short distance of the shore; but such is the exposure to the fierce northerly winds occasionally blow, that no vessel is perfectly secure. It is intended, however, in the course of time, to remedy this natural disadvantage by the construction of a breakwater from the N. W. point of the island. There is also a roadstead on the east of the island, where there is a considerable depth of water, but it is seldom entered by large vessels. The island of Manzanilla is about a mile in length and a half mile in width, extending north and south. It is of coral formation, rising but a few inches above the level of the Atlantic at high tide. Until those connected with the railroad commenced clearing it, the island was covered with a forest of mangrove, mahogany, and manzanilla, from which the island derives its name. From the low level of the place, the marshy nature of the soil, the great accumulation of decomposing vegetable matter, the heat of the climate, and the abundant rains, the island is exceedingly unhealthy, and local miasmatic fevers are greatly prevalent.—Aspinwall being the Atlantic depot of the Panama railroad is subject to a periodical excitement each fortnight on the arrival of travellers to and from California. Those arriving from the East begin their transit across the isthmus, and those from the West end theirs here. When these transitory visitors reach Aspinwall, there is ordinarily a great enlivenment of the usually dull time, and much of the prosperity of the small traders, innkeepers, and barkeepers, depends upon these hurried visitors. Aspinwall and its neighborhood are very deficient in supplies for the wants of the inhabitants. Fresh water is only obtained by collecting in large iron tanks the rain which falls during the wet season, and the chief articles of food come from the New York markets. The neighboring coasts and interior country supply, however, a few fowls, melons,

cocoanuts, pineapples, yams, and oranges. The harbor also abounds in fish, although this is a resource which has not been much employed. The milk used by the inhabitants, in consequence of the want of pasture and necessary scarcity of milch cows, is obtained from goats, which generally feed upon the refuse vegetable garbage in the town. Aspinwall, though belonging to New Grenada, has a separate civic government, of which the control is possessed chiefly by residents from the United States, in the employ of the Panama railroad. There is a hospital in the town, a small church, of which a chaplain paid by the railroad company performs the clerical duty, and a newspaper.

ASPINWALL, WILLIAM, M. D., an eminent physician, particularly famous for his skill in treating smallpox by inoculation, was born in Brookline, Mass., May 28, 1743, and died April 16, 1838. He graduated at Harvard college in 1764, and studied his profession with Dr. Benjamin Gale of Connecticut, and at the Philadelphia hospital. He commenced practising in Brookline, but when the revolutionary war broke out he endeavored to obtain a commission in the army, but was finally induced by Gen. Warren to accept the position of surgeon in Gen. Heath's brigade, and through his exertions was soon after made deputy director of the hospital on Jamaica plain, near Boston. He took part, as a volunteer, in the battle of Lexington. After the death of Dr. Boylston, the pioneer of inoculation in America, he engaged extensively in that branch of practice, opened hospitals for the purpose in Brookline, and probably inoculated a greater number of persons than any other physician in the country. When vaccination was first introduced, although well aware that if successful it would injure him pecuniarily, he tested it impartially, and frankly acknowledged its superior efficacy. His general practice was very large, and engrossed his time and attention for 45 years. During the greater part of this period he made his rounds on horseback, often riding 40 miles a day. For several years before his death he was deprived of his sight, owing to a cataract brought on by his nocturnal studies. He bore this privation with exemplary patience.

ASPIRATE, in grammar, the *spiritus asper* of the Greek denoted thus (´) in contradistinction to the sign prefixed to unaspirated words, and called *spiritus lenis*, denoted thus (˘). It imports that the letter over which it is placed ought to be strongly aspirated, as if an *h* were prefixed, as of ἑλληνες, the Greeks, pronounced *hoi Hellenes*.

ASPLAND, ROBERT, a dissenting minister of England, was born Jan. 23, 1782, in the village of Wicken, in the county of Cambridge, died Dec. 30, 1845. His father was a worthy tradesman of the same name, originally a zealous Churchman, but for the last 20 years of his life an earnest dissenter, at first of the Calvinist Baptist denomination, and finally a Unitarian. The son received a good English and classical

education, first at Soham, and then in succession at Islington, Highgate, and Hackney. By the recommendation of those noted men, Robert Hall and Andrew Fuller, he was admitted to the Bristol academy, on the Ward foundation, in 1798, after preparatory study with the Rev. Joseph Hughes of Battersea. In 1799 he entered the university of Aberdeen, but in the following year he resigned his scholarship on account of the change in his theological opinions, which prevented him from remaining longer a beneficiary upon a Calvinistic endowment. For a year or two he tried to occupy himself with trade, but notwithstanding his good prospects of business he took no interest in it, and resumed his theological pursuits. On July 21, 1801, he was ordained pastor of the General Baptist congregation at Newport, Isle of Wight, with full liberty to preach Unitarian doctrines. When young Aspland entered the ministry he was not 20 years old, yet he had a very various and marked experience of men and opinions. In his religious development he showed less change in his feelings than his opinions, and at the early age of 16 he was so confirmed in religious convictions as to preach publicly in his native village at the little Baptist meeting house built by his father. The fervor that made him so famous as the boy preacher did not leave him with his boyhood, and the change that gradually came over his mind, partly from his mental constitution and partly from association with Independents of antitrinitarian views, did not lessen his early attachment to the Christian ministry. He enjoyed several years of laborious and successful pastoral life at Newport, and after a short stay at Norton he was installed as pastor of the Gravel Pit chapel, Hackney, July 7, 1805, where he continued until his death. Mr. Aspland stood for years at the head of the more active and pastoral portion of the Unitarian clergy of England. In 1806 he established a religious magazine, the "Monthly Repository," and took the lead in founding the Unitarian fund society for the support of popular preaching and the relief of indigent ministers. In 1815 he established the "Christian Reformer," a monthly magazine of considerable influence, which, since his death, has been conducted by his son, the Rev. R. Brook Aspland of Dukinfield. The Nem. Con. club, which embraced leaders of civil and religious liberty, of various opinions, was formed at his house in 1817, and in this and other ways he labored for the repeal of intolerant laws and the triumph of free principles. He was appointed by his brethren of the Presbyterian liberal clergy to read an address on their part at court on Victoria's accession, and on public occasions; he was the leader of his denomination. The list of his publications numbers 50, and since his death a volume of sermons and several pamphlets from his pen have been edited by his son. His style is clear and forcible, his spirit is kindly and fervent, his learning ample without being rare, and the whole impression given by his works is

eminently creditable to his zeal and humanity. He is an excellent specimen of an honest, clear-headed Englishman, trained up under the metaphysics of Locke and the liberty of Milton, and exhibiting under his perhaps somewhat limited philosophical intuition, a love of truth and right that must commend his name to the regard of many who do not share his theological opinions. The memoir of his life, works, and correspondence was written carefully by his son, and published in a handsome octavo in London, by Whitfield, in 1850.

ASPRE, or ASPRE, CONSTANTINE D', baron, Austrian field-marshal of Belgian origin, born at Brussels in 1789, died May 24, 1850. He was the son of the brave field-marshal Van Hoo-brouck, who lost his life at Wagram. He entered into the Austrian army as ensign in 1806, and took part in the campaigns against France. In 1815 he served in the army-corps which held Murat at bay in southern Italy. In 1825, as colonel, he served against the Neapolitan insurgents. In 1848 he was in garrison in Italy when the insurrection broke out. In putting down the revolted Italians and defeating the Sardinian army in 1849, he acted a part only second to that of Radetzky. After being created field-marshal for his services in these campaigns he died at Padua.

ASPREMONT-LINDEN, a noble family in Belgium, descended from Siegfried von Esta, who came to France under Charles Martel (680), and was endowed with the county of Aspremont, near Metz. The family divided into 2 branches, Aspremont and Linden. Gobert III. founded the first; his grandson was made duke by St. Louis, 1295; his descendants obtained the privilege from the emperor Charles IV. (1384) of conferring patents of nobility and coining money. The Linden branch became extinct on the death of Count Charles Robert, 1819. The elder branch, which was raised to the rank of baron of the empire, 1610, and to that of count of the empire, 1676, is still in existence. I. VICOMTE D' OETHE ASPREMONT, governor of Bayonne at the time of the bloody feast of St. Bartholomew. On being ordered by Charles IX. to put the Huguenots to death, he made answer that in Bayonne he could find many loyal subjects, but not one assassin—"My soldiers and I beg you to employ our arms and lives only for things that are possible, no matter how hazardous they may be." II. FRANÇOIS DE LA MOTHE-VILLEBERT, vicomte d', took service in the French army about the middle of the 17th century, was second only to Vauban as a military engineer. As commander of the left wing he gained the victory over the Spaniards at Espouilles, in Catalonia. He fortified Toulon and died there June 27, 1678. III. FERDINAND GOBERT, as imperial field-marshal, stormed Buda, 1686, and served against the Turks in the 4 following campaigns. IV. FERDINAND KARL, born 1689, also passed his life in the Austrian service. He became master of the ordnance, and did good service in the 7 years' war. He died at Vienna, 1772, as imperial field-marshal.

ASPROPOTAMO, the largest river of Greece, rises in Albania, and after a S. S. W. course of 100 miles falls into the Mediterranean sea, near Missolonghi. At Korakos there is a bridge over it 180 feet in length. Aspropotamo signifies the "White river." It was anciently called the Achelous.

ASPULL, George, remarkable for the early development of his musical talents, was born in England about the year 1818, and died Aug. 20, 1832. At the age of 5 he began to give proofs of an extraordinary taste for music, which his father, himself a musician, lost no time in gratifying. In 2 years the child had learned to master the most difficult piano-forte compositions, which he read with great rapidity, and had cultivated with success every style of music, including the concertos of Handel and the fugues of Bach and Scarlatti. He was listened to with astonishment by musicians and amateurs, who could only compare him with Mozart at the same age, and on several occasions played before the royal family at Windsor. As is too frequently the case where the intellect is prematurely developed and the brain overtaxed, his physical powers soon gave out, and he died at the early age of 14.

ASS (*equus asinus*), the humblest member of the horse family, probably that first brought into subjection to man, the most patient, sure-footed, and enduring, and, it must be added, the worst cared for and most cruelly treated of its race.—The horse family, of which the ass ranks as the lowest member, after much discussion and dispute among authorities, has been thus classified. It is of the division *vertebrata*, having a back-bone; the class *mammalia*, giving suck; the tribe *ungulata*, having hoofs; the order *pachydermata*, thick-skinned; the family *solipeda*, uncleft-hoofed; the genus *equus*, the horse.—The principal distinction of the family is the uncleft-hoofed, and this distinction, it may be remarked, has been observed, and has prevailed, not only among naturalists, but generally wherever the animal has been introduced among men not previously acquainted with him, from the earliest periods of recorded history to the present times, as is rendered evident by the names given to him, in countries the most remote and times the furthest removed, by those who have had him introduced as a novelty to their acquaintance. Thus solid-hoofed, or, more correctly, single-hoofed, *μονόρυχος*, is the constant Homeric epithet for horses, at a time when the fable of the centaurs, who are described as scarcely extinct at the date of the events which the poet describes, proves the recent use and knowledge of the animals; and again, solid-hoofed, *pa-bai-shi-ga-gau-ai*, is the name in the Algonquin dialect, given by the northern Indians of this continent to the horse, when he was first brought to their notice by the white settlers of the Canadas—certainly without any collusion with Homer, or knowledge that the same peculiarity had gained this name for the same ani-

mal, among the most polished people of antiquity, to whom he was also brought from beyond the sea; as is shown by the fable of his production in the acropolis of Athens, starting from the earth at the touch of Neptune's trident.—The various members of the equine genus, whose generic distinction is the undivided hoof, are as follows:

<i>Equus caballus</i> , the horse.	
<i>Equus hemionus</i> , of Pallas, the dsiggtai, Asiatic.	
<i>Equus zebra</i> , the zebra.	
<i>Equus burchelli</i> , unnamed in English.	} South Africa.
<i>Equus quagga</i> , the quagga.	
<i>Equus asinus</i> , the ass.	

Of these 6 varieties, 2 only, the first and the last, are domesticated; and of neither of these, so far as it is known, are any to be found in a state of nature, except such as have, themselves, or their progenitors a few generations ago only, escaped from servitude, and increased and multiplied in particular places. Even this, however, has occurred with the true horse, far more frequently than it has with the ass; of which, in fact, it is doubtful whether the present wild ass is or is not the progenitor.—Of the horse, the native land is not distinctly known, although it is known *not* to have been Arabia, nor even, as some have surmised, Egypt, in which country it is first historically recorded as having existed. The probabilities are, on the whole, in favor of an inland African, Abyssinian, or Nubian origin of this noble animal; from one of which countries he was first introduced into Egypt, and thence into all other lands; Arabia, in which he has attained his greatest fame, and excellence of blood, being about the last land of the old world in which he became indigenous. The ass, on the contrary, is known to have been of eastern descent. He is first mentioned in Genesis xii. 6, in the history of Abraham, who, when he went down to Egypt on account of the famine in Palestine, found that king Pharaoh, who took to himself Sarai, Abraham's wife, believing her to be his sister, was possessed of "sheep and oxen, and he-asses, and man-servants, and maid-servants, and she-asses, and camels." And from that time forward, the mention of asses as beasts of burden, supplying the place of the horse under the saddle, is constant and uninterrupted to the end of the sacred history, while the horse is never once spoken of, until after several generations, when Joseph, the great-grandson of Abraham, gave to the Egyptians corn, in the years of the famine, "in exchange for horses, and for the flocks, and for the cattle of the herds, and for the asses."—That they were known in Egypt prior to this famine, appears, however, certain, since chariots are often spoken of before this, which are not adapted to, and are not known ever to have been drawn by asses; but it is nearly equally certain, that they were not known either to the Egyptians, or to the Jews, at the date of Abraham's first visit to the banks of the Nile, when asses were in common use.—At that time, probably, as was the case during all the historic ages of Greece, a

species of ass was wild on the mountains of Syria, Asia Minor, and throughout Persia; and in the latter country and Armenia, in the almost unexplored regions about the sources of the Tigris and the Euphrates, and the shores of Lake Van, it exists in a state of nature to the present day. They are mentioned by Xenophon, in his expedition of Cyrus, as occurring in great numbers in the desert, aromatic plains, through which the army passed, having the Euphrates on its right hand, while marching from Thapsacus in Syria toward Babylon. These plains he calls Arabia, although they lie in what is generally known as Mesopotamia. These animals, which he simply terms wild asses, *ἄγριοι*, of which words the specific Latin name *onager* is merely a corruption, were in company with ostriches, antelopes, and bustards; they were eagerly pursued by the horsemen of the army, and are described as being possessed of extraordinary speed and endurance. The wild asses of the same country, to the latest times, are possessed of the same characteristics. They have always been the especial quarry of the Persian monarchs, and the famous tyrant Nadir Shah was indefatigable in his pursuit of them, and considered the running down of one with his greyhound a feat equal to the winning of a battle or conquering a province. So great was their fleetness, their wind, and the power of maintaining their speed over immense distances, that, unless three relays of fresh dogs could be let slip on them, without a respite, and unless the hunters could get 2 or 3 remounts, there was no chance of their being run to bay, or of the pursuer, mounted on his best Turk or Arab courser, seeing the bay, if they were. Their flesh was considered the most exquisite of venison. Whether this wild ass is or is not the progenitor of our poor, patient drudge, is uncertain; but the probabilities lie against the identity, although the Parisian savants and gourmands of the day are busily crying up the excellence of ass-meat. Speed, however, is a quality which does not degenerate, but, on the contrary, increases, by domestication; as is proved by the fact, that the tamed horse invariably runs down and overtakes his wild congener, even with the disadvantage of carrying the weight of a man on his back. The wild ass of Xenophon, and that, probably identical with it, hunted by the shahs of Persia, is—it may be presumed—the *diggrai*, or *equus hemionus* of Pallas, which, as its specific name, *hemionus*, half-ass, indicates, possesses as much of the horse as of the ass in its character and qualities; and if such, having a distinct specification, cannot be the original stock of the domestic animal, although, of course, like all the horses, capable of interbreeding with it.—To return, however, to the domesticated ass of history, and of modern agricultural and commercial use. The best breed of asses, as might naturally be expected, comes from the East, where he has been long carefully cultivated, having been in use as the saddle animal of patriarchs,

kings, and judges, since almost the earliest period of recorded history. The rocky nature of the soil, and mountainous face of the country, in Judea and Palestine, favored the employment of this hard-hoofed, sure-footed, patient and enduring animal, as much as it discouraged that of the delicate, fine-limbed, high-bred courser of Syria and Arabia; in addition to which, Moses is stated to have forbidden the use of the horse to the Israelites, in consequence of his unsuitability to the country; and it is certain, that while the Jews were pre-eminently a martial people, their hosts, unlike those of the other oriental nations, which were decidedly equestrian, had their force and dependence in their infantry. Their princes and rulers, especially, rode on asses, as is proved by many passages of Scripture. Jair of Gilead had 30 sons who rode upon as many asses, and commanded in 80 cities; Abdon, one of the judges of Israel, had 40 sons and 80 grandsons, who rode on 70 asses; and lastly Deborah, in her song, apostrophizes the great and powerful of the land by the significant phrase, "Ye that ride on white asses."—In connection with this fact, it is worthy of remark, that Lieut. Col. Smith, who has devoted much attention to the equine families of the East, found near Bassorah, very recently, a breed of white asses, remarkable for their excellence, which, he had reason to believe, are of a breed as ancient as the time of the kings of Judah.—The characteristics of the ass, as distinguishing him from the horse, are: 1, inferiority in size; although doubtless this, in European countries, is in great part the consequence of centuries of cruel treatment, scanty fare, and want of attention in breeding; the animal having been for ages regarded only as the degraded drudge of the poorest of the poor; 2, a rougher and more shaggy coat, capable, however, of much improvement by warm keeping and a little grooming; 3, the shortness and stiffness of his postern joints, and the hard solidity of his sound upright hoofs, which seem almost incapable of lameness, and render him the safest and most sure-footed of animals in difficult mountain passes; a lame or a stumbling ass is a thing so rare as to be almost unknown; 4, the extraordinary length of his ears, resembling those of the hare, in a greater degree, than those of his own race, and the peculiar cross which he bears on his back, formed by a longitudinal dark stripe along the course of the spine, and a transverse bar across the shoulders. This singular mark is ascribed by superstition to the influence of the fact of his having been the animal on which the Saviour made his triumphal entry into Jerusalem—not, as some Christian commentators have strangely supposed, riding as an evidence of humility on a despised beast of burden, but mounted on the peculiar animal used from immemorial time by the kings of the Jews. It, however, only indicates his family connection with the wild members of his race, the zebra and quagga, who are yet more conspicuously striped, and of

whose character and disposition the ass possesses many points. The usual color of the ass is gray, mouse-colored, or black, and as they tend to bay, dun, or chestnut, the horse colors, their quality deteriorates. The dental system of the ass assimilates to that of the horse, and in like manner indicates the age of the animal, by the changes and marks of the teeth. The male ass is a perfect adult, capable of propagation, at 2 years; the female somewhat earlier; the latter carries her foal 11 months, producing it in the beginning of the 12th. The sexual potency and vigor, in both sexes, are excessive; which may explain the fact that in the hybrids of the ass and horse, the offspring are much nearer as well in organization as in temper and appearance, to the former than to the latter progenitor. In all cases, the mule is an ass, modified by a strain of the horse; not a horse, modified by a cross with the ass. The hybrid foal of the male ass and the mare is the true mule; that of the stallion and the she-ass, the hinny—the latter being less strongly tintured with the blood, and having less of the form of the ass, owing to the superior influence of the male in the physical form and external organization of the progeny.—The mule, like the ass, brays, owing to a peculiar construction of the larynx; while the hinny neighs, like its sire. There is no doubt but that with careful breeding, grooming, stabling, and nutritious feeding, the ass might be improved, at least as much as any other domestic animal, and probably in a greater degree. As it is, he is admirably adapted for a beast of burden, in cold, mountainous countries, in which, on a quarter of the food on which a horse would starve, he will safely carry burdens under which the more generous animal would break down, over places in which the other could not keep its footing. The character of the ass has been grossly belied, as obdurate, stubborn, and indocile; whereas, under kind treatment, he is hardly inferior in those respects to the horse or the dog. The female is excessively fond of her young; and both sexes are susceptible of strong attachment to their owners, unless alienated by cruelty and brutal treatment. In elevated countries, where the soil is light, asses are serviceable in an agricultural point of view; although in the United States, to which they were first introduced by Gen. Washington, they are little used except for the propagation of mules, which are in considerable and increasing demand, particularly in the southern states—Tennessee and Kentucky being the largest producers of these valuable animals. The best asses are obtained either from Smyrna, of the Asiatic breed, or from Spain, where the race has been particularly cultivated, as it has, also, in Peru, with a view to the business of mule-raising, which in both these countries is an important branch of agriculture.—It is little probable that the prejudice against the ass will ever so far subside, as to lead to any pains being taken, during successive generations, to elevate him to the rank from which he has de-

clined; but if such were the case, it can hardly be doubted that, beside solving a curious question of natural history, the experiment would be crowned with success.

ASSAL, a salt lake of eastern Africa, lying S. W. of Tajoora. It is of an oval form and about 82 miles in circumference. It is said to be over 700 feet below the level of the sea. Its shores are coated with a saline incrustation which in many places is more than 6 inches in thickness. The traders of Abyssinia resort thither in large numbers for the sake of its salt.

ASSALINI, PIETRO, an Italian physician, born at Modena, in 1765, died in 1840, distinguished his self-sacrificing efforts and his publications, in connection with medical and surgical science. He joined the French army under Napoleon, in the campaign against Egypt, but he went only as far as Jaffa, to attend to the victims of the plague, which desolated that city. On this trying occasion he displayed the greatest courage, and in his *Observations sur la peste*, suggested to him by his experience at Jaffa, he discards all fear of infection on the part of the physician attending upon cases of the plague, provided he does not stay too long in the sick room, and takes plenty of exercise in the free air after leaving it. At Cadiz he had opportunity to study many cases of yellow fever, and he reported with great accuracy his experiences in all such cases, and also in many cases of dysentery and other diseases which afflicted the army, and the countries, as Sicily and Calabria, through which he happened to pass. He also occupied himself with the study of maladies of the eye, and the Cesarean operation, and other operations connected with accouchements. The books which he published on these various subjects were received with great favor by the academies of medical science and the profession generally. Napoleon appointed him first surgeon of the court, and surgeon in ordinary of the viceroy. After the Russian campaign he practised his profession at Milan, where he presided over the institution for midwives and orphans, beside attending to his duties as chief surgeon of the hospital of St. Ambrosia, and filling a chair at the medical college of Milan.

ASSAM, or ASAM, a kingdom in further India, bounded on the N. by Thibet, on the E. by China, on the S. by Burmah, and on the W. by Bengal. It was part of the Burman empire, but circumstances led to the interposition of the British in 1825, who took the kingdom under their protection. The country abounds in all the richest productions of the east, the precious metals, cereals, spices, silk, the costly works, and all the choicest products of both temperate and tropical climates. Recently the tea plant has been cultivated with some success, although the preliminary difficulties attendant on the introduction of the shrub have kept up an artificial price. The fertility of the soil is dependent on the annual inundations of the rivers, of which the Bramapootra is the largest.

The inhabitants are worshippers of Brama, and Bengalee is very generally spoken; their numbers are insufficient to bring out the capabilities of the country, while the inertness which their bounteous climate favors, prevents manufacturing industry. The population does not exceed 200,000.

ASSAS, NICOLAS, chevalier d', a French officer of the end of the 18th century, whose name has been handed down to posterity, on account of a single act of self-sacrifice, which caused his death. It happened during a fight near Geldern, Oct. 15, 1760. Assas had the command of the night watch, and while he went a little in advance of his men to see whether all was right, he found himself of a sudden surrounded by a band of soldiers of the hostile camp, who threatened to shoot him, if he should betray their presence. The safety of the army depended on his conduct. Without hesitating he shouted for his soldiers at the highest pitch of his stentor voice. The soldiers came on. The enemy's plan was frustrated, but before even the sound of his voice had fully expired, Assas had ceased to live. The French government conferred an annual pension of a thousand francs upon his family.

ASSASSIN, a word introduced by the crusaders into the western European language. It originated from being given to the disciples and followers of the then celebrated "old man of the mountain." Bound to him by fearful oaths, in their terrible and bloody fanaticism they murdered unhesitatingly—reckless of dangers and death—whoever was pointed out to them by their arbitrary chief. He was called Hashishin, this name being derived from Hashishet, an opiate now known as *hashish*, used by the chief to bring his followers into a state of murderous frenzy. The use of this opiate was introduced among the Arabs and Mohammedans by a contemporary of Mohammed, a sage named Inder-Baba-Retan, a great botanist, and, as some Mohammedans maintain, a founder of the der-vises.

ASSAULT, in law, is usually but not necessarily accompanied by battery. The assault need not be accompanied by blows. A demonstration of violence, a blow or a stone which misses its aim, is an assault; a battery implies actual contact either with an instrument or missile. Assaults are felonious or common assaults. They may be made either the subject of a prosecution or of a civil action. A felonious assault is an assault with an instrument calculated to produce death, such as knives, swords, guns, and so forth; or it is an assault with intent to commit some worse offence, in itself a felony, such as rape; a common assault is a battery with the fists or sticks and stones. The consequences are widely different. The common assault being esteemed a light offence, a misdemeanor (literally ill-behavior), so that a man who batters his wife within an ace of her life, with a poker, or bites off an opponent's nose or ear, is only deficient in polite and orderly

conduct, and is either fined or sent to prison for a few weeks, while a scratch with a pen-knife might subject the offender to years of prison discipline. The police reports of every day in the year display this remarkable inconsistency in the law of assault. The statute law of England establishes some distinction in the quality of the persons assaulted. Magistrates, policemen, and certain other persons, are additionally protected.

ASSAULT, in military affairs. See ATTACK.

ASSAYING (Fr. *essayer*, to try). This term, applied always to metallic compounds, is variously used, sometimes in the sense of analysis, which means the separation and estimation of all the ingredients; sometimes to signify the determination of the quantity of gold or silver in any alloy with other metals, and sometimes to signify the separation of the principal metals in any ore. The first use of the word is incorrect; the second is the oldest and commonly received signification, still in use among workers in gold and silver; and the third is the use of the word among metallurgists, and is generally limited by them to separations made in the dry way, that is, by the crucible. By the French chemists it is not limited to this application alone, for the ablest treatises on the subject are the *Essais par la voie seche* and the *Essais par la voie humide*, of Berthier. A general view of the subject can be given by treating it as applied to gold and silver alone; and some special methods of assaying a few ores of other metals may be added. The process of separating gold and silver from other metals with which they are alloyed depends on this principle, that they cannot be converted into oxides by combining with the oxygen of the air, while the other metals they are generally alloyed with can be oxidized at a high temperature. The first object, then, is to melt the alloy, and while it is in fusion cause the baser metals to be oxidized. The process by which this is effected is called cupellation. It is applied in economical operations on a large scale, as well as in the laboratory process.—The apparatus consists of a small wind-furnace, a muffle, and little cups, or cupels, made of burnt bones ground to powder and moulded together with water. The muffle is a flat-bottomed earthen vessel, 8 or 10 inches long, 3 or 4 wide, and 2½ or 3 inches high, its top arched over, one end open, the other close. In its roof and sides are little apertures through which air drawn in at its open end can pass. It is set in the furnace, in the side of which is an opening corresponding to the open end of the muffle. Coals are heaped around and upon it to expose it to the full heat of the furnace. The cupels should be prepared of bone-ashes, well burnt, ground, and washed, and then shaped into cylindrical forms, an inch or so high and 2 inches in diameter, their tops having a shallow depression to hold the metal. These cupels have the property of absorbing the oxides of the metals and holding those that will not oxidize; but as they cannot absorb a great-

er weight than their own of the oxide of lead, or litharge, not quite so much of this metal should be put into any one as its own weight. A piece of silver to be assayed for determining its purity is carefully weighed in a delicate balance. It may be from 80 to 40 grains, or even less, if already considerably alloyed. A proper quantity of lead, known to contain no silver, is put with it, and the two are placed, by means of small tongs, in the cupel, which, with the muffle, has been brought to a full red heat in the furnace. It is convenient to carry on several of these operations at once, and therefore a number of the cupels are usually introduced together on the floor of the muffle. The metals immediately melt and form a bright globule, which boils and spins around, and keeps in continual motion. The air drawing in through the muffle oxidizes its surface, and fumes of the oxide of lead are carried off by the draft. At the same time a floating scum of the oxide is constantly flowing down the sides of the globule and sinking into the cupel, while freshly formed oxide replaces it. Any copper that is present is oxidized with the lead and absorbed into the cupel. Thus the operation goes on till it terminates by all the lead being oxidized, which is indicated by a sudden brightening up of the little globule, and the cessation of the appearance of the fumes and scum of oxide. This little globule, which is pure silver, shows by its diminished weight the quantity of alloy that was in the sample. Care should be taken to avoid too intense heat, as this may volatilize a portion of the silver; and the globule should not be cooled suddenly, as the pure metal absorbs oxygen when melted, and gives it out in cooling. If the change is sudden some silver is apt to be ejected with the gas. By a little experience and care this operation is made so perfect that no sensible difference should be detected in the weight of two buttons obtained from two assays of equal weights, when tested by a balance that turns with $\frac{1}{100}$ of a grain. The quantity of lead that should be added is a matter that can only be determined by experience. Too little lead for the silver prevents the formation of a clean button, free of oxide, and too much lead is apt to carry down with it into the cupel a small quantity of silver. This operation is often performed with the blowpipe, and small cupels adapted to its uses. The weight of the little button is ascertained by the size of the round hole, of a graduated series of such holes in a brass plate which it fits, the weight of a button of silver or one of gold for each hole having been previously ascertained. In skilful hands this is conducted very expeditiously, and with considerable accuracy. It is especially adapted to the testing of argentiferous lead ores, to determine approximately their percentage in silver. The lead also may be quantitatively determined by the reducing process with the blowpipe, that must precede the cupelling. M. Gay Lussac has introduced into the French mint and other establishments in Paris, a simple method of de-

termining the quantity of silver by precipitating it from its solution in nitric acid. This is done by a solution of salt of known strength, which is dropped from a graduated vessel into the silver solution as long as the cloudy precipitate of chloride of silver continues to be formed. The process is very similar to that of determining the strength of an acid solution by the quantity of alkali employed to neutralize it. The weight of the material used to produce a certain effect is employed for calculating the quantity of the substance operated upon.—If gold alloyed with copper is to be assayed, some silver must be added to the alloy, for copper alone with gold is not easily separated from it. The alloy of the three metals may be cupelled; the copper is oxidized in the process, and the gold and silver remain together. The alloy of these metals is separated by the process called parting, or quartation, as it is usually conducted upon an alloy made to contain at least 8 parts of silver to 1 of gold. If the silver is in larger proportion, it is no matter, but when of small amount compared with the gold, it is shielded by the gold from the action of the dilute nitric acid, which is used to dissolve out the silver. To insure a perfect union of the gold and silver added to it, it is well to melt them with lead, and then separate the lead by cupelling. More heat may be safely applied than when silver is cupelled without gold, as the alloy of these cannot waste by volatilization. The button is hammered out, heated red hot, and annealed, and then rolled into a thin plate, which is coiled up, of the size of a quill, and called a cornet. This is put into a parting-glass, and 2 or 3 times its weight of pure nitric acid is poured upon it. Some heat is applied, when red fumes of nitrous acid gas are given off, and in a short time the silver is dissolved, and the gold is left, still retaining the form of the coil, but a brittle, spongy, brown mass. The solution of silver is poured off, and a strong acid is added to the gold, and heated to dissolve out the last traces of silver. This is poured off, and the gold is washed with hot distilled water. It is carefully taken out, put in a crucible, and heated, when it shrinks together, regains its metallic lustre, and the fine color of gold, with its softness and flexibility. Being now weighed, the process is finished by the calculation of the quantity lost. The silver is recovered by precipitating it from the solution by the introduction of bright sheets of copper, for which metal the acid has a greater affinity than for the silver. It is ascertained that in this process the silver is never entirely taken up by the nitric acid, and that some gold is dissolved by the strong acid, as is found by preserving for years the same acid to extract the last traces of silver. The inside of the bottle containing it becomes at last coated with fine gold. This has been noticed in the British mint, and full 80 grains of gold have been collected from bottles thus used. Very small errors are thus involved in estimating the quantities of silver and gold

by this process.—The assaying of iron ores is based upon the same principles as the reducing them in the blast-furnace. The oxygen, with which the metal is combined, must be taken up by presenting to it some substance for which it has stronger attractions than for iron, and the earthy impurities must have such substances added to them, that the product of their union will be a glassy fluid, through which the globules of metallic iron can easily sink and collect together in a button. Charcoal is the substance for deoxidizing the ore in the blast-furnace, and in the crucible. The matters for aiding the fusion, called the flux, vary according to the earthy ingredients of the ore. The desired glassy fluid is a silicate of lime and alumina, and it may be of magnesia. If the ores already contain much silica, carbonate of lime, either pure or the magnesian carbonate, with the addition of some alumina, or common clay, constitutes the proper flux. Ores deficient in silica require an addition of it. Some ores contain such a mixture of proper fluxing ingredients, that they melt easily without any addition of these matters. In the crucible, a little borax increases very much the fusibility of the mixture. The ore and fluxes should be thoroughly ground and mixed together, and placed in a braqued crucible, *i. e.* one carefully filled and rammed with fine charcoal, moistened with water to a paste, and out of the top of which a cavity is excavated for holding the assay sample. The crucible is to be placed in a wind-furnace, gradually heated for half an hour, when the whole force of the blast is to be applied for half an hour longer.—The assaying of copper ores, as conducted by metallurgists, is often an empirical process, the fluxes being added with very vague ideas as to their true effect. The ores are properly classified into those which contain no sulphur, arsenic, or any foreign metals but iron; those which contain sulphur, iron, arsenic, antimony, &c. Ores of the first class, containing over 8 per cent. of copper, are reduced in a crucible by the addition of 8 parts of black flux. Poorer ores must be assayed in the wet way. The second class are sulphates, or sulphurets. The former are easily decomposed by heat in a platinum crucible, when they may be treated as substances of the first class. The sulphurets, under which general head are included most of the workable ores of commerce, are treated in a great variety of ways. The first operation, after reducing them to fine powder, is to roast or calcine them, to expel the sulphur. This process requires care and experience, and is most thoroughly effected, according to Mitchell, by adding one-tenth of their weight of carbonate of ammonia to the roasting mass in the crucible, constantly stirring it in as the calcining goes on. The ammoniacal and sulphurous vapors having a strong affinity for each other, the whole of the sulphur is extracted. The ore is then thoroughly mixed in a mortar with 25 per cent. of its original weight of lime, and 10 to

20 per cent. of fine charcoal, and $1\frac{1}{2}$ times its weight of dry carbonate of soda. The whole is to be placed in the same crucible in which the roasting was done, and covered with its weight of glass of borax. It is then subjected to a moderate heat for a quarter of an hour, and to a bright red heat as much longer. On cooling, and breaking the crucible, the button of copper will be found in the bottom. It is well to make two parallel assays of these ores, that one may confirm or disprove the other.—The common varieties of lead ores subjected to assay are the sulphurets (galena) and the carbonates. The former is treated by taking 400 or 500 grains, coarsely powdered, and mixing with it one-fourth its weight of black flux, one-fourth of iron filings, in small pieces, and one-eighth of cream of tartar. The crucible should be large enough to contain double the quantity, and the charge should be covered with common salt half an inch deep. After being exposed to a high heat for 10 minutes, the lead may be poured out, or suffered to cool in the crucible. If the ore contain much earthy or pyritous matter, a less proportion of iron filings should be used, and a little fluor-spar and borax be added. Galena is conveniently assayed in an iron crucible, the crucible itself furnishing the material for desulphurizing the ore. The usual quantity, say 400 or 500 grains, is mixed with $2\frac{1}{2}$ times its weight of carb. soda, and put in an iron crucible, which is covered. The galena is decomposed, and sulphuret of iron formed. The lead is poured out into an ingot mould, and the crucible well tapped to obtain all the lead. Another sample is immediately put in while the crucible is hot, and the operation repeated as long as the crucible lasts. It will last longer by being equally heated on all sides. The carbonates are assayed with half their weight of black flux, and a little cream of tartar, with a superficial covering of salt.

ASSELYN, JAN, a distinguished Flemish landscape painter, born at Antwerp in 1610, and died in 1660 at Amsterdam. He studied under Jan Miel and Esaias Vandervelde at Antwerp, and under Peter de Laer (Bamboccio) at Rome. In his landscapes taken from the vicinity of Rome, which are enriched with ruins of edifices, and decorated with figures and cattle in the style of Berghem, he imitates the manner of Claude Lorraine. His touch is bold, his coloring bright, his skies warm, and his figures well drawn and skilfully disposed. He also painted battle pieces of considerable merit. He was surnamed *Crabbetjje* (little crab, crab-like) by the Flemish artists at Rome, on account of a contraction in his fingers.

ASSEMANNI, the name of a Christian Syrian family, several members of which distinguished themselves by their knowledge of the oriental literature. The first most learned among them was JOSEPH SIMON, born at Tripoli in 1687, died at Rome in 1768. He was educated at Rome, took orders, was sent by the pope to visit the libraries of the monasteries in Syria

and Egypt, whence he brought back to the Vatican many valuable works. He was created bishop and regent of the library of the Vatican, and began a publication of the oriental manuscripts found there. He thus contributed more than any one else to make the Syrian literature known to Europe. His nephews, STEPHEN EVODIUS and ALOYSIUS, or JOSEPH LOUIS, both came young from Syria to Rome, received there a clerical education, and in the course of the 18th century distinguished themselves as orientalisks, bibliophilists, and authors of various works, including catalogues of celebrated Roman and Florentine public and private libraries. Finally, one of the name known as the Abbot SIMON, a learned Maronite, was professor of Oriental languages at the university of Padua, where he died in 1821.

ASSEMBLY. This is a term introduced from the French (*assemblée*), and is employed to designate meetings or gatherings of persons for a variety of purposes. I. Socially. We apply the term assembly to gatherings for conviviality or amusement, and also to informal meetings of the community, or any particular class of it, for literary or religious conversation or discussion. Such assemblies have no powers not enjoyed by private citizens; they are only aggregations of individuals for concert of thought or action. Every such assembly has its rules, either expressed or understood, for self-regulation, but they have no action or existence beyond the assembly itself. II. Politically. The word assembly designates certain bodies of men associated for civil purposes, and possessed of more or less political power, such as the Roman assembly, the *assemblées du champs de Mars*. These associations may be from the people, and so be democratic to a greater or less degree, or they may be convoked by the mandate of a king, and so be aristocratic or monarchical. Such an assembly is always possessed of more or less power to make its deliberations or enactments rules of conduct for itself, or those whom it represents, beyond the pale and time of the assembly itself. It is also either within the scope of the political constitution or charter under which its members reside, and is therefore constitutional; or, it arrogates to itself powers not recognized by those documents, and is revolutionary. In the latter class may be mentioned the French national assembly of 1789, which, by a stroke of revolutionary policy, absorbed into itself the powers exercised by the 3 orders under the then existing government of France. The term assembly, in some states of the Union, designates both branches of the legislature jointly. In others it designates the lower branch only, while in others still it is used with the prefix "general," with the same application. III. Ecclesiastically. The term assembly has been applied since about the time of Calvin to bodies of the clergy or laity, representative or otherwise, met to deliberate or act on matters pertaining to the doctrine or discipline of the

church. Such an assembly, under a government where the church and state are allied, has certain political or at least civil powers, and can associate the arm of the law to enforce its enactments; while in countries where church and state are not united, the assembly can only enforce its decisions in that province which the custom of the country has assigned to the jurisdiction of the church, and even then not to the detriment of any civil right of the individual. In Scotland and in this country, the word assembly has an ecclesiastical importance which deserves mention. Under the influence of Knox, the great religious reformer of Scotland, there grew up a very strong party in favor of the independence of the church; that is, its separation from all civil interference. To accomplish this, a representative convention of clergy and laity was held first in 1561, at which the plans of emancipation were of course but imperfectly matured. Through long and painful contests, sometimes disgraceful to both parties, the Presbyterian element at length attained in the memorable assembly of Glasgow (1638) the ascendancy it desired, abolished the episcopal hierarchy, and continued its sittings in the face of the royal mandate of adjournment. This may be regarded as the commencement of the general assembly of Scotland, considered as a deliberative and judicial body in the exercise of determinate and acknowledged functions. The triumph of the assembly was but temporary. In the protectorate, by the policy of Cromwell, the sittings of the assembly were forbidden, and the same prohibition, though on different grounds, was continued after the restoration, until William III., who restored the assembly and the 3 inferior judicatories of the Scottish church to the exercise of their functions, though without admitting their claims to an entire independence of the state authority. Ever since the revolution, the general assembly has nominally been adjourned from year to year by the royal commissioner, who sits in the assembly, but without any power even to vote in its deliberations. The commissioner proclaims in the name of the English crown, that the assembly will be reconvened on a stated day, while the ecclesiastical moderator of the assembly announces the adjournment to the same day in the name of the Lord Jesus, as "the only Head of the Church." The general assembly of Scotland is the highest of the 4 judicatories of the church. The other 3 are, the synod, the presbytery, and the kirk session. The general assembly is representative, legislative, and judicial in its powers. It is thus constituted: 80 presbyteries send 218 ministers and 94 elders; the city of Edinburgh sends 2 elders; 65 other royal burghs send one elder each; the 4 universities and Marischal college send each a representative, who may be either a minister or elder; and the church in India in connection with the church of Scotland sends 1 minister and 1 elder. The assembly thus admits of lay representation, and so differs essentially from

the convocation of the church of England. The assembly holds its sessions at Edinburgh in May, during 10 days, and all business not completed within that time is assigned to commissions which are empowered to hold meetings quarterly. The moderator of the assembly is by modern custom a clergyman, and preaches a sermon at the opening of the session. Final appeal in all parochial matters is had to the assembly from the inferior judicatories. On account of conceived encroachments on the independence of the church of Scotland by the crown, in 1643, at the annual meeting of the assembly a secession of the Non-Intrusionists, with Dr. Chalmers at its head, took place, and the Free Church of Scotland was organized, and constituted a general assembly on the same principles as the former establishment, though it is more generally designated as a synod. These must be distinguished from each other. Only one other remark deserves to be made here, to guard against mistake in reading various works on the ecclesiastical history of Scotland. The branch of the church of England, which, despite of the civil disadvantages to which it has been subjected in Scotland, has perpetuated itself in that country, and which to-day consists of a primate (archbishop) and 6 bishops, is denominated in all works written by church of England authors, "the Church of Scotland," and that which in this article has been designated as the church of Scotland, is called "the Scottish establishment," back to the revolution of 1688.—The term general assembly is used in the United States, as in Scotland, to designate the highest ecclesiastical court and legislature of the Presbyterian denomination of Christians. But while Presbyterianism as a religious doctrine, and in the leading principle of church government characterized by its name (Presbyterian), has the same symbol as Scotch Presbyterianism, the general assembly of American Presbyterianism essentially differs from that of the Scotch, from the consideration that the United States civil government recognizes no established religion, and puts no religious denomination in any connection with the State. The first general assembly of the American Presbyterian church was held in 1789, though the denomination had existed in this country since 1704, the first presbytery having been organized in that year. Previous to the holding of the general assembly, and about the middle of the last century (1741), the Presbyterian church was divided by a schism into 2 parties, one organizing (1745) under the name of the New York synod, while the other retained the name of the Philadelphia synod. The division was partly doctrinal, but more on account of the action of the synod concerning itinerant evangelists, and the necessity of a liberal education as the condition of a license to preach. The Tennent family, within the limits of the New Brunswick presbytery, were prominent in the schism of 1741. But the breach was at length healed, and in 1758 a proposition was

made for a reconsolidation, which was finally effected. In 1786, it was proposed to divide the synod, which since the reunion had been known as the New York and Philadelphia synod, into 4 synods, and then out of these 4 to form a general assembly, which plan was consummated in 1789; and on the third Thursday of May in that year the first general assembly of the Presbyterian church met in Philadelphia. This continued until the second division, which occurred on doctrinal grounds, into Old School Presbyterianism and New School Presbyterianism, since which time (1838) there have been 2 general assemblies, one for each of these branches of the church. In the last meeting of the New School general assembly, held in Cleveland, Ohio, in May, 1857, that body adopted a paper on the subject of slavery, with which a portion of its members were not pleased. These members therefore united in a protest against the action of the assembly, and issued a call for all who sympathized with them to meet at Washington, D. C., in the month of August following, for the purpose of organizing a third general assembly, in which the subject of slavery should not be introduced. The place of meeting was subsequently changed to Richmond, Va., where the question was discussed, and laid over for further action, at a future meeting to be held in Knoxville, Tennessee.

ASSENT, ROYAL, the form by which the English sovereign signifies approbation of a bill in parliament. The assent is either by the sovereign in person on the throne, or by commissioners appointed for that purpose. Supply bills are assented to in the commons, other bills in the lords. The form used is Norman French, *le roi le veut* to a common bill, *soit fait comme il est désiré* to a private bill. The assent is pronounced by the clerk of the parliament. The custom of using Norman French was abolished by the thoroughly English-hearted Cromwell, whose form was "the lord protector doth consent." But the restoration restored the French language with French influence; and although in 1781 it was enacted that all judicial proceedings should be in English, this form was left as an exception, possibly by accident. The royal assent is a form; the modern usages of parliament do not bring the question to the issue of an assent. The sovereign is presumed to accept the advice of ministers. Personally, the president of the United States is more powerful in the affairs of government than the sovereign of Great Britain. The last instance of refusal of royal assent was in 1707, by queen Anne, of a Scotch militia bill. An act of parliament takes effect from the date of the royal assent.

ASSER, or ASSERIUS MENEVENSI, a learned monk of St. David's or Menevia, in Wales, died about 910. Asser was invited to the court of Alfred the Great, of Wessex. Upon the reputation of his learning, King Alfred first wished him to reside all the year round at his court, but Asser would not leave his monastery

altogether, so it was arranged that he should divide his time between his English and his Welsh residence. He read Latin with Alfred out of such few books as the king possessed, and corrected his translations. Alfred bestowed many ecclesiastical preferments upon Asser. Some authorities say he became bishop of Sherburn. Asser's great work is his "Life of Alfred," in Latin. The earliest edition is that of Archbishop Parker, at the end of Walsingham's "History," 1574. The best edition is that of Wise, Oxford, 1722, entitled *Annales rerum gestarum Alfredi Magni*. This is our chief authority for the events of Alfred's public and private life from his birth to 889, and conveys much incidental intelligence about the laws, manners, and general civilization of Wessex at that time. It should be said, however, that Thomas Wright, in the *Biographia Britannica Litteraria*, maintains that this life is one of those literary forgeries which were thought pardonable in those days, and that it was written at a later date, and Asser's name affixed to it. Drs. Pauli and Lingard, and J. M. Kemble, do not assent to this, and Mr. Wright remains as yet without a supporter. Bale and Pitts give the titles of 5 other works ascribed in their day to Asser. They are not extant. His life, after his patron and pupil's death, is obscure.—ASSER, or more correctly ASHI, is the principal author of the Babylonian Talmud. He was born at Babylon A. D. 353, and died 427. He was appointed head of the college of Sora at Babylon. His disciples numbered 2,400. This Talmud was as important a work to the Jews of the east for generations as Luther's translation of the Bible has been for the German Protestants since the reformation. The Jewish community have ever held him in peculiar honor.

ASSESSORS. I. In civil law, a professional adviser who sits beside unprofessional judges to advise them on taking the evidence, or the state of the law. In the Roman empire the provincial governor was generally a rude soldier who knew nothing of law, but yet was the high court of appeal. It was usual to supply his deficiencies by an assessor. A civilian often attends courts-martial for the same purpose. II. In England, in the election of municipal corporations, officers of this name are appointed to assist at the election, and ascertain the result. III. In America the assessors are men who are elected by the popular vote, to assess and appraise property for the purposes of taxation.

ASSETS, in law, from the Norman-French, *assets*, sufficient, is the generic term for the property of a person deceased. In this country the important legal distinctions known in European law, between real and personal property, are practically abolished, both for testamentary purposes, for devolution, and as a means for payment of creditors. The peculiar character of real estate was part of feudalism, and a necessary consequence of the system is

hereditary honors and estates. Until quite recent years, landed property in England, even when not entailed, was not applicable, in the hands of the heir, to the payment of debts. Now, however, the remedies against real estate are very materially extended, and this *opprobrium juris* in the law of debtor and creditor is removed. Assets are real or personal; they are also legal or equitable. Under the head of real estate is included all lands in possession, some interests in land, and some rights connected with land. Legal assets may be generally defined as property in possession; equitable, as rights to property. The executor or administrator is not deemed liable, by the law, for any other assets than those which have come to his hands, which qualification does not, of course, imply that they have come into his actual, but into his constructive possession or control. In the interpretation put on this, the courts generally favor the executor or administrator, unless he be acting *de son tort* (in his own wrong), that is, where a person has assumed the office without being duly constituted. The mode of collecting and applying assets will be more appropriately detailed under the head of **EXECUTOR**. The executors must exhaust personalty in payment of debts in the order of assessed taxes, judgment debts, and decrees, according to priority of docket or emolument, recognizances, bonds, sealed instruments, notes, bills, and unliquidated demands and accounts. The personalty must be exhausted in payment of these, and then the real estate may be had recourse to.

ASSIENTO (Spanish for treaty), a term understood to have exclusive reference to the treaties made by Spain with foreign countries for the supply of negro slaves to her South American provinces. The Spanish government having no settlements on the African coast, encouraged adventurers to supply slaves by securing to them a monopoly of the supply with other commercial privileges. The Flemish merchants had the contract until 1588, afterward the Genoese until 1696, when the Portuguese took it. In 1702 a French company accepted the contract, the terms of which were the privilege of sending a ship of 500 tons, with merchandise free of duty to Spanish America, and the payment of a sum on each imported negro, the minimum number of slaves being fixed at 4,500 annually. In 1748 the contract which had been transferred to the South sea company, was abandoned at the peace of Aix la Chapelle. It never gave satisfaction to Spain; and the contractors always lost money by it; their local factors and agents reaping the profits, and making large fortunes.

ASSIGNAT, the name of the paper currency in France at the time of the revolution. The French government finding itself short of money in 1789, issued under the name of "assignat," paper-money to be redeemed by the value of the property of the clergy and the emigrants, which the government had seized, and

which was intended for sale. The assignats kept their value above 90 per cent. until 1792, but from that time they began to droop. The original issue of 1,200 million francs was increased to such an exorbitant amount, that the markets became glutted with assignats. Robespierre and others made great efforts to prop the market; but it was all in vain. They fell soon to 60 per cent., and in 1795 they could be had at 18 per cent. Thomas Carlyle in his "French Revolution" (vol. ii., p. 449), says, in reference to the calamity produced by the emission of the assignats:—"There is, so to speak, no trade whatever for the time being. Assignats, assignats, long sinking, emitted in such quantities, sink now with an alacrity beyond parallel. 'Combien,' said one to a hackney-coachman, 'what fare?' 'Six thousand livres,' answered he: some 300 pounds sterling in paper-money. On the 1st of Feb. 1796, at the Bourse of Paris, the gold louis of 20 francs in silver costed 5,880 francs in assignats. Pressure of maximum withdrawn, the things it compressed likewise withdrew. 'Two ounces of bread per day' is the modicum allotted; wide-waving, doleful are the bakers' queues; farmers' houses are become pawnbrokers' shops." The assignats gradually dwindled down to nothing, involving the whole land in ruin,—excepting a few lucky speculators,—and resulted eventually in national bankruptcy.

ASSIGNATION, a Russian paper-money, introduced early in the reign of Catharine II., about the year 1770, principally to carry on the wars against the Turks. The standard currency was then as now the silver ruble, and the paper assignations on the banks—likewise founded by Catharine—were to represent in full the standard silver coin. But they soon fell until the assignation-ruble was worth only one-half, one-third, and finally one-fourth of the original value; and thus it became necessary to specify the nature of the ruble in all transactions. From 1787 the use of assignations as currency was general in all money affairs, both public and private. Paul I., enraged because the merchants of St. Petersburg, foreign and domestic, refused to receive assignations at the government standard in payment, threatened that he would erect a gallows on the exchange for their special benefit. Stringent ukases for facilitating the circulation of assignations all over the empire proved wholly unsuccessful, and at the death of Paul, and during the greater part of the reign of Alexander I., the assignation-ruble was generally worth one-fourth of the silver. During the wars against Napoleon the issue of assignations increased excessively, but still no considerable additional depreciation took place. With peace and increasing prosperity the assignations rose, and finally the government fixed the standard at 8 rubles, 60 copecks, either of copper or assignations, for a silver ruble, one assignation-ruble equalling 100 copecks copper, and four copecks copper making one of silver. On account of the facility of carrying in paper the

large amounts of money required for the internal trade, in a country where almost all operations are for cash—the assignations soon came into such demand as to be worth a premium over the standard. This premium naturally increased the further you went into the country. Thus assignations were dearer in Moscow than in St. Petersburg, and still dearer in Kasan, or Astrachan. These fluctuations were so irregular and inconvenient that, in 1839, a ukase regulated the value of the assignations at $8\frac{1}{2}$ to 1 silver, and ordered that henceforth the silver ruble should be the legal unit in all negotiations and legal documents, that a new paper-money, called "bills of credit," should be issued, and the old assignations gradually withdrawn from circulation and destroyed. This was accomplished, and the name, the use, and the existence of assignations belong now altogether to history.

ASSIGNEE, in law, the party to whom property has been assigned or made over. It has also various technical significations; the assignee of a bankrupt or insolvent, is the party in whom the legal interest in all the property is vested to be applied in payment of debts, answerable to the agents *de faillite*. Formerly assignees were exclusively appointed by the creditors, but this having led to some abuses, less of malversation than of neglect, official assignees have lately been appointed both in England and France (*syndique provisoire*).

ASSIGNMENT, in law, the making over or transferring of any species of property. It also signifies the deed or instrument by which the transfer is operated. The assignment of a lease is the transfer of the assignor's whole estate in the term created by the original lease. The difference between an assignment and an underlease is that the underlease retains the reversion, whereas the assignment parts with it. Assignment in commercial law was formerly much restricted. Bills of lading, bills of exchange, were not assignable. All interests in personal property, of which a man had not the actual possession, but merely the right to recover, are choses in action. Thus a debt, whether speciality or simple contract, is a chose in action, something to be recovered. These were not assignable. These restraints were, however, evaded by a license to use the name of the legal creditor. Even under a bill of sale of goods the property in them does not pass unless by actual delivery and possession as against *bona fide* creditors. Both by the English and French law, property in the power and disposition of a debtor may by process of law be transferred to his creditor.

ASSING, ROSA MARIA, a sister of Varnhagen von Ense, a German poetess, born in Düsseldorf, May 23, 1788, died Jan. 22, 1840. The outbreak of the French revolution obliged her family to take up their residence in Strasbourg, the native place of her mother; and in 1796 they removed to Hamburg. After the death of her father in 1799, she was burdened

with many cares, and began to employ her talents and education in teaching. In 1816 she married Dr. Assing, a physician of Königsberg, who removed to Hamburg; and their house, in which a generous hospitality prevailed, became a favorite place of reunion for the most esteemed literary persons of Germany. The poet Ohannisso, the early friend of Rosa Maria and her brother, was a frequent visitor. She had early begun to express her inward experiences in poems and tales, but her friends could persuade her to publish only a few pieces. Her poems published with a memoir of her life under the title of *Rosa Maria's poetischer Nachlass*, Altona, 1841, give a full insight into the genius of this admirable lady.

ASSINIBOIN, a large river in N. America, which flows north and empties into Lake Winnipeg. It is formed by two branches, one of which, the Red river of the North, rises near the head of the Mississippi, and the other the Assiniboin proper. On the banks of this river the soil is arid and sandy, and the country is in possession of the north-west company, which has on its banks several trading stations and depots. The Assiniboin Indians have recently been estimated at about 4,500 souls, and are utterly uncivilized. They are of the great Sioux or Dacotah family, and speak the language of most of the tribes found on the north of the sources of the Missouri. They subsist entirely by the chase, and have not been yet persuaded to turn their attention to agriculture.

ASSISI, a town of the Papal states in the parish of Umbria. It is especially noted as the birthplace of St. Francis, the founder of the order of Franciscans, and as containing 12 monasteries of that order. Here are the church and monastery in which St. Francis is buried, and about 2 miles from the town is the celebrated portiuncula or church where Francis first began the preaching of his ascetic life. Assisi was once a Roman municipium of some importance, as is evident from the remains with which it abounds. The most remarkable of these was a temple of Minerva, of which several Corinthian columns still stand. Assisi is now a bishop's see, and contains about 6,000 inhabitants. The region immediately around Assisi abounds in mineral waters.

ASSIZE, a term of the common law, having reference to several distinct subjects. Its most general use is applied to an ordinance for regulating the sale of provisions, and to the periodical sittings held by the judges of England, and law officers in the various circuits of England and Wales, for the trial of lawsuits as well civil as criminal. The term is of uncertain derivation. It may be either from *assido*, to assess, or *assideo*, to sit near or together, both of which are incident to the functions discharged at assizes. It is well known that the whole of England and Wales is divided into circuits or districts for the despatch of judicial business. The origin of this institution is attributed to Alfred the Great; although it was not perfect-

ed and reduced to its modern shape until the reign of Edward I., who was called the English Justinian on account of the number and importance of the changes effected during his reign in the laws, and their administration. Suits for the recovery of land were anciently tried by writ of right, or of assize. On these occasions the sheriff impanelled 4 knights and 12 assistants, to try the matters in dispute. This assize could only be held before a judge of the principal courts at Westminster; whereby enormous expense was entailed on the jurors, the parties, and their several witnesses. To remedy this grave inconvenience, provision was made by Magna Charta, that an assize should be held annually by a judge in each county. This declaration was enlarged by the statute of Westminster (18 Edward I. c. 3), which gave jurisdiction to the judges not only to sit in the grand assize, for the old purpose of settling disputes as to land, but also for the purpose of adjudicating all civil actions. The sittings thus held are familiarly known as sittings at *nisi prius*. The term has originated from the form of the process for summoning and impanelling the jury; which, following the words of the statute of Westminster, directs the sheriff to summon a jury to be at Westminster on the first day of term, unless before (*nisi prius*) a judge shall come to try issues in the county.—The criminal jurisdiction of the court at the assizes is derived from a commission of oyer and terminer, and general gaol delivery. Courts for these purposes are held at each assize. Two assizes a year are held throughout England and Wales, and in the metropolitan and some other counties which comprise populous districts. Three assizes are held under modern statutes. Courts of quarter sessions are also held in the several counties, cities, and boroughs. The sessions despatch business of a quasi-judicial character, ale-house licenses, poor law questions, appeals under certain statutes; and of late years, with the view of relieving the pressure of assize business, jurisdiction has been given to county magistrates sitting in sessions, to decide certain criminal causes of minor importance. Under the statute, the assizes are held by 2 judges of the superior courts of Westminster, one of whom usually presides in the criminal, the other in the civil court. All reserved points of law, exceptions, and other purely legal questions arising out of the proceedings at the trial, are argued subsequently at Westminster before the full court. Final judgment cannot be entered up until after the first 4 days of the term next after the assizes, which gives opportunity to move the court above for new trials, to set aside verdicts, or to stay judgment for any cause assigned. To obviate the evils of the delay thus afforded by common law, a recent statute gives discretion to the judge at *nisi prius* to certify for immediate execution, in all cases of simple contract debts. The bar at the assizes, or "upon circuit," as the more correct phrase is, is composed of the same

barristers who argue at Westminster. At the time of entering his forensic career, a barrister usually selects the circuit on which he intends to practise. This is determined either by local connections, or by other motives of personal preference. This point settled, a barrister cannot by etiquette flit from circuit to circuit, but abides by the one he has chosen. Sometimes, on a special arrangement, which is always accompanied by a very heavy fee, a leading barrister will be taken from his own circuit to conduct a cause at another,—the rigor of the rule being, as it would seem, relaxed in favor of a great man,—just the case where it should be most strict; though whether the celebrity of the advocate or the amount of the honorarium determines the question of propriety, is not quite clear. After a certain pitch of forensic fame has been attained, a great advocate sometimes ceases to go the circuit any longer, except on special retainer. Sir Fitzroy Kelly has received \$4,000 for one such fee, exclusive of daily refreshers.—The ASSIZE OF BREAD, or provisions (*assise venalium*), is the ordinance of a royal officer, or of the municipality, fixing the price and quality of bread, beer, meat, fish, coals, and other necessaries. This was anciently fixed by the clerk of the market of the king's household. By some municipal charters this power was delegated to the corporation.—ASSIZES OF JERUSALEM were the laws made in 1099 by Godfrey of Bouillon, and the princes and clergy, for the regulation of the kingdom of Jerusalem, formed in the first crusade.

ASSOCIATION OF IDEAS. There is a certain law of the human mind, by which one thing, or idea, coming into the field of consciousness, brings another along with it. This law is designated by the term association of ideas. Among philosophers, there has been much discussion concerning the nature of this law or action of mind, and what in an ultimate analysis is the ground of it. Hume was the first modern philosopher who attempted a scientific statement of association. Closely following Aristotle, he traced this action to certain principles which he denominated: 1, resemblance; 2, contiguity; 3, causation; and another has since been added, 4, contrast. The meaning of this classification is, that whenever a thought or perception is present in the consciousness, the mind spontaneously recalls either: 1, thoughts or perceptions resembling it; or, 2, those which occurred to the mind in contiguous time or space; or, 3, those which are effects of causes identical with, or similar to that which we recognize as the cause of the present perception, and also those which are either causes or effects of the present perception; or, 4, those which are so strongly contrasted with the present perception as to be regarded as its opposites in one or all its features or properties. Hume considered association the regulating principle of our mental activity. It is, however, not to be understood that the principle of association so regulates the action of

the mind, as to give to it that unity of impressions and recollections desirable to a fixing of its faculties on a given subject. On the other hand, if we were to follow the spontaneous suggestions of this power of association, the chain of our thoughts would present the most grotesque and whimsical appearance. The judgment must be exercised in selecting those associated thoughts which are perceived to have a natural connection with each other, in order that our process of reflection when represented to another, may appear orderly. This consideration gives rise to a classification of associations into: 1, natural, and, 2, artificial, or arbitrary. By natural associations are meant those which are founded in some natural resemblance spontaneously suggested to every mind, or when suggested justify themselves on natural and universal laws of mind; whereas by artificial or arbitrary associations are meant those which have been the result of an accidental individual experience, or of an intentional individual effort for the purpose of aiding the memory, and which, therefore, have no universal and general validity. An instance of the former is when I associate a book with its author, as a cause; of the latter, when I associate a certain book with a fishing-boat because I found it there. Dr. Thomas Brown made the association of ideas to depend on a mental law which he denominated suggestion, and divided into simple and relative. He reduces all the intellectual states to these two capacities. In simple suggestion, which he defines as that by which the mind associates ideas and emotions according to two classes of laws, primary and secondary, he includes all those faculties or activities denominated conception, memory, imagination, and habit. Attention and recollection are the first two of these, combined with desire or will, and reverie is the third without any volition. In relative suggestion, defined as the feeling arising in the mind when two or more objects are perceived or conceived, he includes judgment, reason, and abstraction. All this theory of Brown implies that suggestion is an ultimate and simple fact or activity of the mind. If this were the case, it never could be voluntary. All simple activity must be spontaneous. Brown includes memory under suggestion. The fact is evidently the reverse. We are compelled to associate things which have been in the field of consciousness together or simultaneously, whether because naturally or accidentally thus allied, and simply because this association grounds in the fact that memory is inexorable and involuntary, and so brings the things thus once allied in consciousness into the field of consciousness together, when it brings them at all. Instead of memory being included in association, memory is itself the inclusive, and shuts up association or suggestion within itself. We have no power over a train of associated thoughts as they run through our minds like a chain drawn through our hands, simply because we had not the power over our expe-

riences at the first, when they were stamping themselves upon the tablet of the memory. I meet a man to-day with a hat in his hand. I never saw a hat before. To-morrow I find a hat by the road-side. I can no more restrain the thought of the man I saw yesterday than of the hat. Memory brings both of them into the field of consciousness, because they both make up the impression or picture of which the hat was a part. A complete history of the doctrine of the association of ideas is given by Sir William Hamilton in his edition of the "Works" of Dr. Reid, note, p. 889.

ASSONANCE, ASSONANT RHYMES, *asonancia*, in Spanish poetry, a peculiar species of rhyme, less complete than that in general use. It consists in the correspondence of the last accented and all subsequent vowels only, while the consonants may and should be different. Rhyme, as it is used in the English language, is called, in Spanish, *consonancia*. Thus, *b(a)r(ba)r(o)* is assonant, but not consonant with *a(a)l(a)m(o)*, and *pl(a)u(a)m(o)*. *B(u)cas* is assonant with *c(u)ran*. So in English, "baby" and "chary" would be assonant to each other. Assonant rhymes do not generally follow each other in pairs, as in ordinary English rhyme, but alternate with a blank verse, as:

A caballo saltó el Moro
Y otro día desdichado
En negras andas le vuelven
Por donde saltó a caballo.

Calderon, and the other classical dramatists of Spain, always use *asonantes*. Here is an example of double *asonantes*:

Aguárdate, dijo el pavo
Al cuervo de los ojos
Bebes lo que estás pensando
Que eres negro y feo.

ASSOUCY, CHARLES COYPREAU D'. This French literary gentleman, who was born in Paris in 1604, and died in 1674, was one of the most grotesque characters of the literary gypsy order of the 17th century. He was educated by the Jesuits, and his mind became so precociously developed that at the age of 9 he ran away from his parents to England. At Calais he passed himself off as the son of Nostradamus, and narrowly escaped being drowned by the good people of that town, who took him for a sorcerer. In 1621 he turned up as a music teacher, at Montpellier, but being expelled from the town, he betook himself to Turin, where he insinuated himself into the good graces of the dowager duchess of Savoy. He had a knack for flash songs, and played the lute admirably well, and on his return to Paris he found favor in the eyes of Louis XIII., who was at times afflicted with hypochondria, and found a pleasant relief in the harmonious buffooneries of Assoucy. In 1654 he went on a great musical expedition all over southern France from Lyons to Montpellier, giving concerts in every town and village, and spending in gambling the money and presents which he received, for gambling was one of his foibles. At Lyons he fell upon Molière, with his itinerant troupe of

comedians. Between Molière and Assoucy there were naturally many bonds of sympathy, and 6 months passed before the merry adventurer could drag himself from the society of the jolly dramatist. In Montpellier Assoucy met with an accident. He had taken two assistants with him on his ambulating musical trip, two sprightly creatures, dressed in the garb of pages, who by the people of Lyons were supposed to be women, while the authorities of Montpellier declared them to be young men. In Lyons he had the reputation of a Don Juan, but in Montpellier it was much worse. Unnatural crimes being punishable with death by fire in Montpellier, Assoucy narrowly escaped the stake by a precipitate departure for Avignon in the Papal states. From Avignon he bent his steps to Turin, where he resumed his functions with his old acquaintance the venerable dowager duchess of Savoy, but some satirical verses brought him into disgrace. He was requested to leave the Sardinian capital, and proceeded to Rome. But satire again involved him in difficulties. He used strong expressions against the priesthood, and was thrown into prison. While there, he made a lucky hit. St. Amand, the French poet, had given great offence to the Romans by his tirade against Rome, in his poem, entitled *Rome ridicule*. Assoucy replied to this in a felicitous manner, and in verse. Some influential persons were pleased with his refutation of what they considered St. Amand's slander. The pope himself, Clement IX., was highly satisfied with it, sent for him, and presented him with his portrait engraved upon a golden medal. From Rome he went to Marseilles, where for several years he observed the greatest discretion. At length he returned to Paris in 1670, but there he found the Montpellier accusation suspended over him, and on his arrival he was marched off to prison, from which, however, he was released, after a detention of 6 months, the poor fellow turning out innocent after all. During the rest of his life he devoted himself to the composition of various works, suggested to him by his singular experiences. Some of his poetry is pleasant and graceful enough, but he was not intended by nature for a poetical genius, and became a butt of ridicule for the literary notabilities of his day.

ASSUAY, or ASUAY, a department of Ecuador, lying mostly east of the Andes, between the Amazon and Putumayo rivers, and extending from the equator to lat. 5° 30' S., and from long. 68° 30' to 79° 20' W. It contains 188,926 square miles and about 200,000 inhabitants, nearly five-sixths of whom are Indians. It is well watered, having the Ambyaon Napo, Nanay, Pequena, Chambyra, Pastaza Morana, and Panta rivers traversing it, beside other smaller tributaries of the Amazon and Putumayo. The whole western portion is an elevated desert, called the Paramo or desert of Assuay, being a plateau formed by the intersection of the Andes by 2 chains of mountains running from E. to W. and enclosing the vast

plain of Quito. The remainder of the department is fertile, but is in the hands of Indian tribes, except a few towns. There are some mines of gold and silver in the mountainous districts. The principal towns are Ouença, Loja, Zaruma, Tumbes, and San Juan de Bracamoros.

ASSUMPSIT, in law, "he undertook," the compendious title under which an extensive class of actions at law are included. After stating the cause of action, the pleadings state that thereupon "the defendant promised to pay." Assumpsit may be either special or common, also called *indebitatus assumpsit*. Under the former are included actions upon written contracts or agreements of all kinds; actions for derelictions of duty by professional men, carriers, warehousemen; in short, under every circumstance where a contract is in actual existence or can be predicated from the relations of the parties. Common assumpsit is an action brought for goods sold and delivered, money lent, &c. Theoretically all actions of assumpsit are brought to recover compensation in the nature of damages; but, where those damages can be immediately ascertained by the acts of the parties, as for goods sold and delivered, where a price has been agreed, then it is common assumpsit.

ASSUMPTION, a festival of the Roman Catholic church, instituted to commemorate the ascent of the Virgin Mary into heaven. From a very early period it has been the general belief of the western and oriental churches that after her death the Virgin was taken up, body and soul, into heaven. This event is called promiscuously in the ancient ecclesiastical writings, the "assumption," "passage," or "repose," and is mentioned by various early authors, among whom are the learned Andrew of Crete, in the 7th century, and St. Gregory of Tours, in the 6th. The date of the institution of the festival is unknown, but it is mentioned as having been celebrated with great solemnity before the 6th century, in both Greek and Latin churches. It falls on the 15th of August.

ASSUMPTION, a district or parish in the S. E. part of the state of Louisiana, having an extent of 820 square miles. It has within its limits a part of Bayou La Fourche and Lake Venet. The soil is very fertile, and mostly devoted to the cultivation of sugar, of which, in 1860, it produced more than any other parish or county in the United States, except Iberville parish. Pop. in 1860, 10,588, about one-half of whom were slaves.—Also, a post village in the above parish on the W. side of Bayou La Fourche. It is the county seat of Assumption parish.

ASSUMPTION, or **ASUNCION**, a city of South America, the capital of the republic of Paraguay, is situated on the left bank of the Paraguay river, a short distance above the point where it receives the waters of the Pelcomayo, and 660 miles above Buenos Ayres, lat. 25° 18'

S. long. 57° 35' W. It was founded in 1585, but for nearly 800 years was but a small village with a fort. During the present century, however, it has grown to be a place of some importance. It has a cathedral erected in 1845, 5 churches, a government palace, a hall for representatives, a public library, 4 convents, a custom house, theological seminary, and college. The houses are generally of brick, some of the streets are paved, and the appearance of the town, compared with many South American cities, is neat and cleanly. It has considerable trade with Buenos Ayres, Chili, Peru, Tucuman, and other portions of South America, exporting tobacco, hides, cedar planks, mandioca, and, above all, *maté* or Paraguay tea, for which there is a great demand all over South America, and which is produced in greater perfection in Paraguay than elsewhere. Its former rulers interdicted trade with foreign countries, but recently liberal provisions have been made by the government for a more extended commerce. Pop. about 12,000.

ASSUMPTION, one of the Ladrone group of islands in the Pacific ocean, lat. 19° 45' N. long. 145° 27' E. It is of volcanic origin, rises to the height of about 2,000 feet, and is nearly 10 miles in circumference. It produces coconuts, rice, oranges, and bread-fruit.—Also, an uninhabited island in the Indian ocean, S. lat. 9° 14' E. long. 46° 40', a dependency of the Mauritius.

ASSURANCE. See **ANNUITIES** and **INSURANCE**.

ASSWAN, or **ASSUAN**, the ancient *Syene*, a town of upper Egypt, on the right bank of the Nile, opposite the island Elephantine, in lat. 24° 5' N. It has considerable commerce in dates, senna, wicker-baskets, and slaves from Abyssinia and upper Nubia. The surrounding scenery is picturesque, and the Nile here presents the appearance of a small lake. On the southern side are the ruins of an ancient Saracen town, which was so populous during the middle ages that 20,000 persons are said to have died there by one visitation of the plague.

ASSYE, or **ASSATE**, a village of Hindostan in the Nizam's dominions, 28 miles north of Jaulnah, near which, in 1803, the Duke of Wellington (then General Wellealey), with 2,000 British troops and 2,500 sepoys (native soldiers), defeated the combined force of Scindia and the Nagpoor Rajah, amounting to 30,000 men.

ASSYRIA. Both the geographical extent and history of this ancient kingdom are involved in much obscurity. We are mainly confined to 8 sources of information, and those are sufficiently scanty, viz., the Bible, Herodotus, and Otesias; and there are few particulars in which they do not present some discrepancies. The postdiluvian inhabitants of the world, or at least the majority of them, had settled in the extensive plain lying between the Tigris and the Euphrates. There they attempted to establish a kingdom and a religious worship which should consolidate them, and so prevent

the evils they feared from being scattered abroad over the face of the whole earth. From this project they were soon barred by the divine interposition confusing their speech. From the deserted Babel, Nimrod and a portion of his followers journeyed northward to the great Carduchian chain, where, on the eastern bank of the Tigris, in the vast region of Mesopotamia, they founded the city of Nineveh. This was the germ of Assyria. Assyria, in its earliest history, may be thus defined: For its south-western boundary it had the Tigris, and for its north-eastern the Zagros mountains, extending northward to Armenia, and southward to the parallel of latitude on which is the city of Babylon. The tradition of the inhabitants of that territory to this day goes to prove that the kingdom was originally founded by Nimrod. Assyria being thus established by a division of the Babylonian population, it would be natural to expect that both kingdoms would be feeble for a time. We need not wonder, therefore, that the brief histories of the period bring to us small record of the doings of these necessarily rival empires, for several centuries. Josephus mentions that the Assyrians had dominion over Asia in the time of Abraham, but this is too vague a statement either to inspire much credit, or give much information. He also styles the Chushan Rishathaim, to whom the Israelites became subject in the time of the judges, an Assyrian king. With these two glimpses of the Assyrian power, we must be content to pass over a hiatus of several centuries. In the time of Jonah, an Assyrian king is mentioned, but not named. The first Assyrian monarch who seems after the founder of the empire to emerge from the realm of myth into that of history, is Pul, who is named in 2 Kings xv. 19, as coming up against Israel. But a doubt gathers even about him when we recognize in the names of other Assyrian kings further on, the recurrence of the same monosyllable which constitutes his name. We are struck with the apprehension that we may only have reached an Assyrian royal title, instead of a personal king. But at least about this time Assyria seems to be coming forward as a reigning power, though for how long she may have previously been so, we cannot determine. In the contests which were then going on between the divided tribes of Israel and Judah, we find it was the custom of each, whenever the scales of fortune seemed to be turning against them, to throw themselves for protection on the kings of Assyria. The hiatus is passed over, and we at length reach Assyrian history again, with Tiglath-Pileser on the throne. This king is known in Biblical history as the one with whom Ahaz, king of Judah, formed a confederation in his troubles with Pekah and Rezin, at the expense of the sacred vessels of the temple, and the ornaments of the palace. In accordance with the stipulations of this purchased alliance, Tiglath-Pileser made war upon the confederated kings of Syria and Israel. Shal-

maneser succeeded him, and completed the subjugation of Israel, and the destruction of his capital (721 B. C.) This added both to the extent and strength of the Assyrian empire. The same king also conquered Phœnicia, with the exception of Tyre, which successfully resisted a siege of 5 years. The close of Shalmaneser's reign marks the era of Assyria's greatness. Her empire reposed upon the Mediterranean, the Caspian, and the Persian seas. Meanwhile, an expedition had been undertaken against Egypt, the probable cause of which may be found in the attitude into which those two powers came to each other in the troubles between Judah and Israel, Egypt favoring Israel, and Assyria Judah. The conspiracy of Hoshea with So, king of Egypt, will be recollected as the alleged cause of the destruction of Samaria, and the entire reduction of Israel to the rank of an Assyrian province. The expedition against Egypt could not have been very successful, for, if we may trust chronology, in a few years after we find Hezekiah attempting to throw off the vassalage into which his father had brought the kingdom of Judah; and although the attempt was unsuccessful through the artful policy of the Assyrian monarch, yet it suffices to show that Egypt was but partially subdued. Indeed, the very failure itself was on account of a contemplated expedition of Assyria at that very moment, upon Egypt, to complete its subjugation. This time the attempt was more successful, and the throne of the Pharaohs paid heavy tribute to Sennacherib. The result was not, however, without disaster to the Assyrian fortunes. A rumored attack from Ethiopia, and a destroying pestilence that visited his army, compelled the Assyrian monarch to an almost precipitous retreat from the scene of his conquest (2 Kings xix. 35), without avenging himself, as he had intended, upon Hezekiah, for the insurrection in the Judæan province. Meanwhile the ancient kingdom of Babylonia had been in the condition of an Assyrian province, probably ever since the founding of the Assyrian kingdom at Nineveh, and governed by viceroys. In the reign of Sennacherib, his son Eсарhaddon had been the viceroy of Babylon, appointed for the purpose of cementing more closely the apparently sundering province to the empire. On the death of Sennacherib, Eсарhaddon was called to the throne. He appointed Nabopolassar, a Chaldean, to the viceroyalty of Babylon in his own stead, in the hope thus to strengthen his kingdom, by restoring to the growing Chaldean power in Babylonia the supremacy which, by the policy of his father, had been taken from them. This king also avenged the insurrection of Judah, from which his father had been deterred, and also colonized Samaria with the descendants of Judah and Benjamin (Ezra iv. 2). But his policy in the restoration of the Chaldean element in Babylonia was disastrous to the fortunes of Assyria. (See BABYLON.) The Medes had thrown off

the yoke, and the growing importance of Babylonia already threatened the very existence of Assyria. From this time, Assyria losing the prominence she had for a century maintained, her history sinks again into the realm of the mythical, and Babylon takes up the sceptre which Assyria lays down. This transfer of power back to the long-deserted valley of the Euphrates, occurs in the reign of Ninus, Nebuchodonosor, and Sarrac, the successors of Esarhaddon, on the Assyrian part, and was consummated under the viceroyalty of Nabopolassar at Babylon, who, with the assistance of Cyaxares, king of Media, destroyed Nineveh, and reduced Assyria proper to a province of Media, under which name the remaining history of Assyria will appear.—Herodotus makes the Assyrian kingdom to have continued from the time when it comes first distinctly forward into history, through a period of 520 years, which, according to Niebuhr, is to be increased by 128 years, during which Nineveh continued a powerful empire, after the independence of Media and Babylonia. Otesias assigns it an existence of 1,805 years, which is probably fabulous. The political constitution of Assyria was like that of Chaldea and Persia, a despotism, divided for administration into satrapies. The religion of the kingdom was Chaldean, which serves in part to explain her overthrow, supposing a gradual encroachment of an ecclesiastical over a civil power. The language of Assyria was not Semitic, but Medo-Persian, which seems to have been a branch of the Indo-Germanic. The aboriginal inhabitants of Assyria proper appear to have been Koords. Its territory pretty nearly corresponded with the present Turkish pashalics of Mosul, Koordistan, and the upper half of Irak Arabi. The principal rivers of Assyria are the Euphrates and Tigris, and the Great and Little Zab. The upper part is mountainous, while the southern is level. Metals abound in the mountains. The vegetable productions are those of the northern temperate zone. It is divided geographically into 8 unequal provinces by the Great and Little Zab rivers. The most southern was variously named. The middle one was known to the ancients as the Adiabene, while the northern was called Aturia, of which Assyria is probably only a corruption. This, therefore, may be regarded as the central point of Assyria, from which radiated the power which in the palmy days of Shalmaneser and Sennacherib spread over an area of 400,000 square miles, and controlled the commerce of 8 seas. There is much confusion of dates in those few writers who make mention of Assyria, to reconcile which some modern critics have resorted to the supposition of a second Assyrian kingdom, partly synchronous with that whose history is here given, and of longer continuance. It is, however, more probable that the confusion grows out of frequently using Babylonia, Chaldea, and Assyria synonymously, by the ancients. (For an account of ASSYRIAN ANTIQUITIES, see NINEVEH.)

AST, GEORGE ANTON FRIEDRICH, a German philologist, born at Gotha in 1778, died in 1841. He was appointed in 1805 professor of classical literature at Landshut, and in 1826 was transferred to the university of Munich in the same capacity. In the latter part of his life he devoted himself almost exclusively to the study of Plato, of whom he produced a new edition in 11 volumes, with Latin translations and voluminous commentaries, and a *Lexicon Platonicum* in 8 volumes.

ASTARTE. See ASHTORETH.

ASTBURY, J., an English manufacturer, born 1678, died 1748. He is celebrated in the history of the Staffordshire pottery trade. He learned the operations of the trade from the Eulers of Nuremberg, who had established themselves at Bradwell. He set up an establishment of his own at Shelton, and was the first to apply pipe clay to the fabrication of cooking utensils. He made many other inventions in his trade which were all successful.

ASTELL, MARY, an English authoress, born at Newcastle-upon-Tyne in 1668, died at Chelsea, a suburb of London, May 11, 1781. She wrote "An Essay in Defence of the Female Sex" "A Serious Proposal to the Ladies," &c., with the purpose of raising the standard of female education and female character. She was, however, a warm conservative, and decidedly opposed to the new-fangled spirit of the times.

ASTER (*αστρον*, star), a very rich group of plants, of the fam. *composita* Adans. (*synanthera* Rich, *asteraceae* Lindl.), placed in the *syngenesia superflua* by L., distributed in two subdivisions of Endlicher's tribe *asteroides* of the sub-order *tubuliflora* of said family. The composites are one of the most natural and the most perfect of all families of plants, as well as the most numerous, being spread over every country of the globe, and containing $\frac{1}{3}$ of all known phanerogamous genera. They predominate on the continent of America. The true genus aster is most developed in North America, especially in the United States, which are thus literally star-spangled. Together with peculiar conifers, oaks, walnuts, the genus *solidago* (golden rod, of the same sub-order with the true aster), it characterizes the northern zone of North America, as one of the botanic regions into which the earth is divided, and which is named from Michaux; the southern zone, characterized by trees with shining broad leaves and large flowers, being called the region of Pursh. The plants promiscuously called asters belong to several genera, of which the real aster is richest in species. Out of 150 species cultivated in Europe more than 100 are natives of N. America. Character of the group: corolla of perfect flowers regular, 5- seldom 4-toothed; styles linear; ovary inferior, 1-celled, ovule erect. Flowers capitate; involucre imbricate, lower scales often spreading; florets of the ray generally more than 10 (none yellow). Receptacle naked; pappus (egret) simple, in few double, hairy. I. ASTER: herbaceous, many species

very stately; from 4 inches to 10 feet high; ray-colors purple, or blue, violet, lilac, white, rosy (of all shades); disk yellow or brown; some change color with age; inflorescence; panicle, or corymb, or raceme, or solitary, or spike; leaves mostly simple; blossom from July to November, some twice or through the summer, if their stem be cut down; some flourish in fields, near roads, some near swamps, or salt marshes; some in rocky soil, mountains; exhaust the soil; propagable by suckers. The finest American species are, *A. nova anglie*: stem erect; leaves narrow, lanceolate, clasping, auriculate at base, crowded on branchlets; involucre scales loose, colored, longer than the disk; hairy; flowers great, blue violet, crowded in terminal corymbs 8 to 8 feet high. *A. puniceus*: habit of the preceding; stem purplish; leaves serrate, rough; flowers purple or blue in panicles, 6 to 10 feet. *A. cyanus*: stem wandlike, branches spreading; leaves linear; flowers many, large, blue in paniculate racemes. Very handsome, 8 to 4 feet. The other fine species are: *horizontalis*, *spectabilis*, *multiflorus*, *californicus*, *macrophyllus*. Species changing the color of flowers: *variegatus*, *varicolor*, *mutabilis*, *eminens*, *paniculatus*. Among the non-American species are: *A. alpinus*, very small; flowers great, violet, disk yellow. *A. amellus* (pink of Christ), and *amelloides*, with numerous very large fine blue flowers. *A. parisiensis*, very elegant. *A. caespitosus* (turf-like), with large whitish-violet flowers. All are called in England Christmas daisies. II. *CALLISTEMMA* or *callistephus* (*kalos*, beautiful, *stemma*, crown), or *asterchinensis*, in French *Reine-Marguerite*, on account of its valuable properties and numerous colors of all shades except yellow. Grows easily in all soils, resists heat and drought; sown at different times, it blossoms through the spring, summer and autumn; simple, double, of most numerous varieties. III. *OLEARIA DENTATA*, or *A. tomentosus*, of New Holland; shrub; leaves oval toothed, woolly beneath, flower-heads solitary, large, white; hot-house plant. II. and III. are of Endlicher's *Diplazapea* (double-egret). IV. *EURYBIA* (wide-spreading, in offsets), *A. argyrophyllus* (silver-leaved), of New Holland; shrub, of rapid growth to 10 feet; flowers many in little heads, whitish gray; disk yellow; musk-scented; flowers in April and May. *E. lyrata*, flowers white. Hothouse-plant. V. *CALLIMERIS* (fine part), *incisa*, *A. inc.* of Siberia; flowers large, lilac in July; 2 feet high. VI. *AGATHAEA* (good, excellent), *A. calletis* of the Cape of Good Hope; bush, blooms the whole year, sky-blue, disk yellow, 1½ to 2 feet; hothouse-plant. All species of this group are very slightly aromatic. Many congeners of the sub-order are medicinal, being astringent, or bitter, or acrid, or strongly aromatic.

ASTER, ERNST LUNWIG, a Prussian general, known as the author of the modern system of Prussian fortifications, born in Dresden in Nov. 1778, died in Berlin, Feb. 9. 1855. At

the outset of his career he served in the Saxon army, in which his father, who died Dec. 1, 1804, held a high position. His first achievement was in connection with a plan for the fortification of Torgau, a town in Prussian Saxony, which in 1810 was adopted by Napoleon. After fighting in the ranks of the Saxon army in the Russian campaign of 1812, and holding for some time the command of the new fortresses of Torgau, he left the Saxon and entered the Russian service. Here he took part in the battles of Bautzen and Leipzig, and distinguished himself by his prowess during the conflicts of 1813 in Upper Lusatia. In 1815 he connected himself with the Prussian army, and by the active display of his proficiency in the military sciences, he rose in the same year to the rank of major-general and inspector-general of the Prussian fortifications. He was an accomplished mathematician and tactician, and his knowledge, fostered by an assiduous study of the systems prevalent in the different military organizations of Europe and strengthened by lifelong experience, found a field of practical application in the fortification of Coblenz and Ehrenbreitstein, which was effected under his superintendence. Of these 2 fortresses he became commandant in 1825. At the same time he continued to attend to the duties of inspector-general of all other Prussian fortifications, and chief of the corps of engineers and pioneers. In 1827 he was made lieutenant-general, in 1837 member of the privy council, and in 1842 general. He left several works, the first 2 vols. of which appeared at Berlin in 1856. Of 3 of his brothers, all employed in the military service of Saxony, KARL HEINRICH, born in Dresden, Feb. 4, 1783, died there Dec. 23, 1855, became known to fame by his writings on military topics. His *Lehre vom Festungskriege* (Manual of the Science of Warfare in connection with Fortresses), was translated into several foreign languages, adopted as a text-book on the subject, in the military academies of Prussia, and passed from 1812 to 1835, through 3 editions.

ASTERABAD, a province and town of Persia, S. of the Caspian sea, from which it is about 10 miles distant. The province is well watered and fertile, but the depredations of the Toorooman tribes prevent its inhabitants from profiting by its local advantages. The town is of no importance in itself. As the nearest frontier town to the Caspian, whose waters are traversed by Russian vessels, it may be of great value in future military operations in central Asia. The Russians have introduced several steamers in the Caspian, and it has even been rumored that they had obtained permission from the Persian government to establish a body of troops there.

ASTERIAS, a genus of radiated animals including, according to the division of De Lamarck, only the star-fish. They are placed by Prof. Forbes in the sub-division *asteria* of the family *asteriada*. The common "five fingers" found

on our sea beaches are asterias; under each finger or ray extends a long channel, through small holes in the sides of which the feet or tentacula project in great numbers. Each foot terminates in a little disk which attaches itself to substances by expulsion of the air. These assist the motion of the animal, which is further effected by small movable spines spread over its lower surface.

ASTERISK, from the Greek, meaning a small star. Its modern typographical use is to indicate a note at the foot of the page, or where there are several on the same page, it is generally chosen to indicate the first note. In ancient manuscript writings, where it is sometimes written thus (*), it is a critical mark to signify either that the passage against which it is set is in its right place, or that it is a remarkable or beautiful passage in itself; it is the antithesis of the obelus or obelisk (†). When used along with the obelisk it signifies passages which are genuine, but in the wrong place.

ASTERN, a term in nautical language used to signify the hinder part of a ship, or the space behind the ship.

ASTEROIDS, a group of small planets, revolving between the orbits of Jupiter and Mars. The 1st was discovered in Jan. 1801, the 5th in Dec. 1845, the 48d, April 16, 1851, the 47th, Oct. 8, 1857, by Mr. James Ferguson, at the national observatory, Washington, D. C., and the 51st, at Nimes, in France, Dec. 24, 1857, by M. Laurent, of the assay office.

ASTHMA (Gr. *ασθμα*, from *ασω*, I respire), a disease characterized by an extreme difficulty of respiration, which is worse at certain seasons of the year, and particular periods of the day; being generally most severe at night. The difficulty of breathing is increased by violent emotions, damp atmosphere, excess of any kind, strong exercise, running, walking quickly, or ascending a flight of stairs. It is also more laborious in the horizontal position, and hence more distress is felt in bed at night; the warmth of the bed also excites increased secretion of the mucous follicles, and this blocks up the air passages more completely, causing paroxysms to be more frequent than during the day. The patient seeks relief by sitting upright in bed, or bending his body forward, and endeavoring to expand the chest mechanically by every possible means. Aretæus described these efforts of asthmatic patients in the following words nearly 1,800 years ago:—"Sub dio ambulare cupiunt, et spirant quasi totum aërem trahere valent." The description is just as good for the same disease in our day. The patient longs to be in the open air, and during paroxysms seems as if he wished by intensely anxious and straining efforts to draw the whole atmosphere into his lungs at each inspiration. When the paroxysm ceases and the chest has been relieved by coughing and expectoration, the patient is comparatively easy for a time, sometimes for a whole day; but night brings on the

same obstruction of the air passages by inspissated mucus, and the same paroxysms of impending suffocation, coughing, and difficult expectoration. Old persons are more liable to the disease than young, as they have generally been more exposed to the extremes of heat and cold, and the inclemencies of weather in all seasons; not to mention bodily and mental fatigue, excessive sensual indulgence, sedentary habits, confined atmosphere, and various debilitating causes which injure the constitution generally, and the nervous system more especially; predisposing the lining membrane of the air passages to chronic irritation, and rendering them sensitive to every change of temperature; colds and catarrhal affections become gradually chronic, the air passages become habitually obstructed, and asthma finally becomes the settled penalty for all the past transgressions of this kind against the laws of nature and the health of the transgressor. Some persons who inherit weakly constitutions from asthmatic parents, are predisposed to become affected by the same disease, more easily than others, and only guard against it by extreme precaution, in avoiding all excessive sensual indulgence, and exposure to fatigue of any kind; bad air, ill-ventilated rooms, sedentary habits, ardent spirits, poor food, extremes of temperature, and all the causes which, in fact, are apt to bring on the disease, where hereditary weakness forms a predisposing liability to the affection.—The pathology of this disease differs, of course, in different cases, and hence the apparent difference of opinion among medical writers and authorities; some describing the disease mainly as a nervous affection; others as the result of organic lesion of the heart and blood-vessels; while others again attribute it to dilatation of the air-vessels of the lungs. All these and many other complications may and do exist. It is now believed that spasmodic asthma is caused by a spasm of the muscular fibres encircling the bronchial tubes, especially the smaller branches. The existence of these fibres has been proved by eminent physiologists, who have produced contraction by galvanizing them. In common asthma, the lining membrane of the air passages is more or less affected as in chronic bronchitis, but the affection of the mucous membrane extends further down into the lungs, the air-cells are more obstructed, and the conformation of the chest itself is often somewhat contracted and defective. The action of the diaphragm is imperfect, as well as that of the walls of the chest, and hence it is that, from want of innervation and free action in these parts, the disease is commonly deemed nervous, as distinguished from chronic bronchitis, which affects the bronchial mucous membrane chiefly. In spasmodic asthma, the nerves are still more deeply implicated; their action seems defective in the respiratory organs, as stammering shows imperfect nervous action in the organs of speech; and in both cases the difficulty is increased by physical or moral ex-

citement. Chronic asthma, however, is not a dangerous disease. It seldom shortens life, where patients carefully avoid all violent emotions, exercises, and excess, although spasmodic paroxysms may endanger life at any time where these precautions are neglected. The precursory symptoms of asthma are languor, flatulency, and general debility; headache and a feeling of heaviness over the eyes; uneasiness about the præcordia, with a sense of fulness and straightness in the epigastrium.—Attacks of spasmodic asthma generally occur during the first sleep, soon after midnight, or very early in the morning. The patient suddenly awakes with a sense of suffocation, tightness of the chest, and difficulty of breathing. The respiration is wheezing and laborious, the shoulders are raised, and every effort made to enlarge the chest. After a short time, the pale and anxious countenance becomes suffused or bloated, and covered with perspiration. The pulse is usually quick, weak, and irregular; the lower extremities cold. When cough and expectoration come on, the patient is relieved, and soon the pulse and respiration assume their natural state. The spasm, however, may continue half an hour or more, and even as much as 3 or 4 hours, in some cases, before relief can be obtained by coughing and expectoration. During the paroxysm, the muscular fibres are in a state of spasm. By this contraction the lungs are in a manner contracted within the chest, and the walls of the thoracic cavity, pressed by the weight of the external atmosphere, lose that sonorous elasticity produced by the natural distension and fulness of the air-vessels in the lungs.—Asthma is generally complicated with diseases of the heart or with chronic bronchitis, acting as a source of permanent congestion, predisposing the parts to be more easily thrown into a state of spasm. Sometimes severe attacks of dry catarrh are aggravated by spasm, as in the "bronchial asthma" of Andral.—The most common consequences of the disease are chronic inflammation and dilatation of the bronchi; emphysema and œdema of the lungs; hæmoptysis; tubercular deposits are also very frequent concomitants; hypertrophy and dilatation of the cavities of the heart; effusions into the pericardium, the pleura, and sometimes congestion and effusions in the head, giving rise to coma or apoplexy. The treatment of the paroxysm consists in administering narcotics and antispasmodics, to be given, if possible, as soon as the first sensations are felt. Strong coffee, landanum, and ether, are among the best, and stramonium smoked as tobacco is often very useful, but should be used with caution where the heart is diseased. Those medicines are most effectual which produce expectoration. In the intervals of paroxysms, the general health of the patient requires due attention, and most careful treatment.

ASTI, a city of the Sardinian states, the *Asta Pompeia* of antiquity; in the middle ages a place of considerable importance, the capital

of the republic of Asti, the independence of which was recognized in 1098 by Humbert II., count of Savoy. In 1155, Asti was reduced to ashes by Barbarossa; subsequently it belonged successively to the king of Naples, Robert d'Anjou, to the Viscontia, and the dukes of Orleans, and eventually, in 1528, was ceded by the emperor Charles V. to the house of Savoy. Asti is a flourishing town of 20,000 inhabitants, situated not far from the junction of the Balbi and Tanaro rivers, within a short distance of Alessandria, surrounded with the walls of the old fortress. Its sparkling wine is well known, and it is also famed as the birthplace of Alfieri.

ASTLE, THOMAS, a celebrated English antiquary, and a man of great erudition, born in Staffordshire in 1734, died in 1803. He contributed to the *Archæologia*, and assisted in the publication of many records, MSS., catalogues, &c.; was appointed keeper of the records in the Tower. His principal published work was entitled "The Origin and Progress of Writing, as well Hieroglyphic as Elementary, 1784," a second edition of which appeared in 1803.

ASTLEY, SIR JACOB, afterward Lord Astley, one of the most gallant and most constant adherents and commanders of Charles I. against the parliament, died in 1651. He was major-general of the first army, raised for the king, under the earl of Lyndsey; and commanded the infantry in the first battle of Edgehill, in which the foot of the royalists came so near to gaining a complete victory, that, if the headlong and impetuous Rupert, whose rashness lost the king almost every action in which he was engaged, had wheeled on the flanks and rear of the Puritan infantry, after defeating their horse, instead of chasing the beaten troopers, 5 or 6 miles off the field, the war had been finished in a day, and the king of England would have grasped almost despotic power. At Naseby, being now advanced to the peerage, he, as usual, commanded the foot of the royal army, which, as usual, firing only one volley and charging with their swords and the butt-ends of their muskets, beat the enemy's infantry and threw them into utter confusion. Rupert had broken the left wing of the parliament's horse, and taken 6 of their best cannon; but again, instead of wheeling on the flank of the foot, he chased to the rear, and never returned until the field was lost. On the king's left, Cromwell with his ironides had broken and overpowered Sir Marmaduke Langdale's cavaliers, and the king's horse reserves, refusing to charge, while the enemy was in disorder, with his horses blown, by doing which they might have redeemed the day. Fairfax and his lieutenant-general Oliver charged the infantry on all sides, and not until after several repulses, and with tremendous loss, cut it to pieces, and took all the guns and baggage, and even the king's private correspondence and secret letters to the queen, which were, in the end, among the principal causes of his execution. After this defeat, the war was at once resolved into a series of small partisan encounters, until

such time as the parliament commanders found means to crush the several divisionary powers in the various counties into which the scattered and defeated army of the king had resolved itself. The last of these conflicts, which terminated the campaign of 1645, and in fact the war itself, was the total rout and defeat of Lord Astley, who, as it is related by Clarendon, "being upon his march from Worcester toward Oxford with 2,000 horse and foot, the king having appointed to meet him with another body of 1,500 horse and foot, letters and orders miscarried and were intercepted; whereby the enemy came to have notice of the resolution, and drew a much greater strength from their several garrisons of Gloucester, Warwick, Coventry, and Evesham; so that the Lord Astley was no sooner upon his march, than they followed him; and the second day, after he had marched all night, and when he thought he had escaped all their quarters, they fell upon his wearied troops; which, though a brave resistance was made, were at last totally defeated; and the Lord Astley himself, Sir Charles Lucas, who was lieutenant-general of the horse, and most of the other officers who were not killed, were taken prisoners. The few who escaped were so scattered and dispersed that they never came together again, nor did there remain, from that minute, any possibility for the king to draw any other troops to the field." The barony expired with its first possessor; but his descendants still hold his original rank, as baronets in the county of Norfolk, among the gentry of which shire they hold a distinguished place; and the Christian name, Jacob, of the king's honest, brave, plain major-general, still remains at the head of the family.

ASTLEY, PHILIP, a famous equestrian, was born at Newcastle-under-Lyne in 1742, and died in Paris, Oct. 20, 1814. His father was a cabinet-maker, and in 1753-'4 removed with his son to London, where they pursued that trade until 1759, when young Astley enlisted in Elliott's light horse. He served in the German wars for 7 years, and distinguished himself in many actions by his bravery; he was rapidly promoted, and particularly noticed by his general. On the return of the army from the war, he obtained an honorable discharge and certificate of service. Being an expert horseman, Mr. Astley now commenced practising in public as an equestrian; by constant industry and economy he at length acquired sufficient means to enable him to build a circus or amphitheatre, which, under the titles of "Amphitheatre Riding-House," "Royal Grove," "Amphitheatre of Arts," and "Royal Amphitheatre," he conducted successfully until 1794, when it was destroyed by fire, its owner being then with the army on the continent. In 1795 it was rebuilt and again destroyed by fire in 1803; but with characteristic perseverance Mr. Astley erected a new amphitheatre in 1804, which he leased to his son. During his life he built for his own uses 19 theatres in London, Paris, and Dublin,

and in connection with Antoine Franconi assisted to establish the "Olympic Circus." He published several works, including "Remarks on the Duty and Profession of a Soldier," 1794, "Description and historical Account of the Places near the Theatre of War in the Low Countries," 1794, "Astley system of Equestrian Education," 1801, &c. Mr. Astley was a man of imposing appearance, being upward of 6 feet in height and of great muscular development; he was greatly respected by all who knew him, and many acts of charity and benevolence are recorded of him, proving that he was as deserving of love for his kindness of heart, as of respect and admiration for his perseverance, great physical powers, and personal bravery.

ASTOLPHUS, called by the Germans Aistulf, king of the Lombards in northern Italy, succeeded his brother Rachis 749, and died in 756. After having seized the exarchate of Ravenna, he threatened Rome. Pope Stephen II. fled to France and demanded aid from king Pepin. As Astolphus refused to withdraw, Pepin crossed the Alps (754) with an army. Astolphus was vanquished and fled to Pavia, where he was besieged. He obtained peace on condition of restoring Ravenna and all his other conquests. On the withdrawal of Pepin, Astolphus burst forth again, laid siege to Rome, and ravaged all the surrounding country. The pope again supplicated Pepin, who crossed the Alps, and shut Astolphus up in Pavia. Astolphus was preparing for a new war, but fell from his horse while hunting, and died 8 days afterward without leaving male heirs.

ASTON, LOUISE, a German authoress, the daughter of a Prussian clergyman, and celebrated for her zeal for the so-called emancipation of woman. She early displayed the energy of her character both by marrying, while extremely young, a gentleman of English descent, named Aston, who was at the head of a thriving industrial establishment of Magdeburg, and by resolutely divorcing herself from him, after she had ascertained that he had not any sympathy with her reformatory aspirations. Two years after the divorce, they were re-married, but again separated. Soon after this final separation from her husband, she made her appearance in the streets of Berlin in masculine costume and with a cigar in her mouth. This gave offence to the police, and she was requested to leave the city, which she did; but, in 1848, she came back. Mrs. Aston is not only what is commonly called a strong-minded woman, but is at the same time a person of considerable literary attainments. Her published works are numerous, consisting of novels, poems, and autobiographical sketches. She showed her benevolence by the self-sacrificing assistance which she gave, as nurse, to the sick soldiers in the Schleswig-Holstein lazaretto. In 1851 she returned to the sphere of domestic life by marrying Dr. Meier of Bremen.

ASTOR, or HASARA, a river of central Asia.

joining the Indus north of the Himalaya mountains. Its general course is north-west. A fort of the same name is situated on it.

ASTOR, JOHN JACOB, a merchant of the city of New York, born in Germany, in the village of Waldorf, near Heidelberg, July 17, 1768, died in New York, March 29, 1848. He was the youngest of the 4 sons of a peasant, and his boyhood was passed in the healthful labors and simple customs of a farmer's life. He was trained from a child to rise early and to devote a part of his first waking hours to reading the Bible and prayer-book, practices which he cherished through life. His brothers seem to have shared his spirit of enterprise and energy, for 2 of them preceded him in passing beyond the Black forest and the Rhine, one of them to establish himself as a maker of musical instruments in London, and the other to settle in America. At the age of 16 he accepted an invitation from his brother in London to join him in his business, and with adventurous zeal he bade adieu to his parents, walked to the coast of Holland, and embarked in a Dutch smack. After reaching his destination he showed the elements of his character and the value of his early discipline by rising invariably at 4 o'clock, and by performing his duties in the most exemplary manner. But he looked forward to even a wider field of enterprise than London. At the age of 20 years, possessing a manly person and address, he became one of the pioneers in the great emigration to the West. In the year 1788, a few months after the recognition of the independence of the United States by Great Britain, he sailed for Baltimore, taking with him a few hundred dollars' worth of musical instruments to dispose of on commission. The vessel had reached Chesapeake bay when a storm threatened shipwreck. Astor surprised the passengers by appearing upon deck arrayed in his best suit, but gave a satisfactory answer to their inquiries. "If," said he, "I save my life it shall be in my best clothes; if I perish it is no matter what becomes of them." On the voyage he made acquaintance with a shrewd and communicative furrier, in accordance with whose suggestions he exchanged his musical instruments in New York for furs, with which he immediately hastened back to London, where he disposed of them to great advantage. He prepared again to cross the Atlantic and to devote himself systematically to the fur trade. In London he studied the continental fur markets, and made himself familiar with every variety of the article, and on returning to America established himself at New York, where he afterward always resided. Consignments from his brother doubtless assisted him in his first struggles for fortune, but his energy was chiefly devoted to the fur trade, and in pursuing his business he occasionally visited London, and more frequently Montreal and the distant trading posts in Canada. When the treaty negotiated by Mr. Jay, in 1794, removed the obstructions which had previously existed to the exporting

of furs, he was prepared to take advantage of it by his extensive acquaintance with the trappers and traders of the West and North, and he was soon able to reap a double profit by sending his furs to Europe and the East in his own ships, which brought back cargoes of foreign produce to be disposed of in New York. His business became extended till it embraced markets in every quarter of the globe, yet so exact was his acquaintance with these markets, and so wide was the grasp of his mind, that he was able to guide the action of his supercargoes and captains by the most minute instructions. At this time, while his commerce covered the seas, he always rose early and left his business at 3 o'clock, P. M., and was accustomed to show his workmen occasionally that he could equal the best of them in sorting and beating furs. At the beginning of the century he was worth \$250,000, the result of only 16 years of business life, and he now began to revolve colossal schemes, not only of trade but of colonization—not only of supplying with furs all the markets of the world, but of planting towns and spreading civilization in the wilds of the western continent. He obtained the patronage of the government for a plan of sending regular supply-ships to the Pacific coast, especially to the Russian possessions on that coast, and, in opposition to many wealthy corporations, began to put in effect the great though unsuccessful scheme which occupied so many years of his life. It was his aim to organize the fur trade from the lakes to the Pacific by establishing numerous trading posts, making a central depot at the mouth of the Columbia river, and then, by obtaining one of the Sandwich islands as a station, to supply the Chinese and Indian markets with furs sent directly from the Pacific coast. In prosecuting this gigantic scheme it is said that he expected only outlay during the first 10 years, and unprofitable returns during the second 10, but after that a net annual result of about \$1,000,000. After hearing of one of the first and most fatal disasters which befell the series of expeditions that he sent to Astoria, he went in the evening to the theatre, showing only his accustomed cheerfulness. The fur trade was not the only source of his fortune. He early began to make investments in real estate in New York, and in the rapid growth of the city it was said that some portions of his property centupled on his hands, and he erected numerous handsome private and public buildings. His fortune, the largest ever accumulated in America, has been estimated at not less than \$20,000,000. During his whole career he hardly made a misstep through defect of his own judgment, and his memory retained for years the minutest details. He was in the constant habit of riding for pleasure and exercise, and until his 55th year was customarily at his office before 7 o'clock in the morning. He lived during nearly a quarter of a century in retirement, in the society of his family and of eminent practical and literary men, his mind retaining its vigor after his bodily

strength had become greatly enfeebled. He gave many liberal donations during his lifetime, and his will contained numerous charitable provisions. One of these was \$50,000 for the benefit of the poor of Waldorf, his native village, a sum which the grand duke of Baden has judiciously applied for the instruction of young persons who would otherwise have been destitute of educational privileges. The crown of his beneficence is, however, the Astor library in the city of New York, the fruit of a long-cherished purpose, and of much consultation in the latter part of his life. (See "Life of Astor," by David Ralph Jaques, in Freeman Hunt's "Lives of American Merchants," New York, 1858.)

ASTOR LIBRARY. This institution owes its existence to the liberality of John Jacob Astor, who bequeathed \$400,000 "for the establishment of a public library in the city of New York." By a provision of the will, the government of the library was vested in 11 trustees, in whose keeping were placed all the property and effects of the institution; in them existed all power to invest and expend the funds, and to manage the affairs of the library. The first trustees were named by the testator, and consisted of the following gentlemen: Washington Irving, William B. Astor, Daniel Lord, jr., James G. King, Joseph G. Cogswell, Fitz-Greene Halleck, Henry Brevoort, jr., Samuel B. Ruggles, and Samuel Ward, jr.; also, the mayor of the city of New York, and the chancellor of the state, in respect to their offices. By a subsequent codicil, Charles Astor Bristed, his grandson, was also appointed a trustee. A provision of the will also designated, as the land whereon to erect a suitable building for the purposes of the library, a lot situated upon the east side of Lafayette place, measuring 65 feet in front by 120 deep. As early as the year 1839, Mr. Astor had purchased a number of volumes, aided by Dr. Joseph G. Cogswell, with the ultimate intention expressed in his will. In May, 1848, the trustees of the library met for the first time, and in accordance with the known desire of Mr. Astor, appointed Mr. Cogswell superintendent, a position which he still occupies. In the autumn of the same year, Dr. Cogswell sailed for Europe, authorized to purchase books to the amount of \$20,000. During an absence of 4 months, he collected 20,000 volumes, which were temporarily placed in a building rented for the purpose. A second and third visit by the superintendent, increased the number of volumes to 70,000, with which the present building was opened, Jan. 9, 1854. The Astor library is built in the Byzantine style of architecture, richly ornamented with brown stone mouldings, and an imposing entablature. Its dimensions are in accordance with the directions of the will, its height being about 70 feet. The library room is 100 feet in length by 64 in width, and 50 in height; this is reached by a flight of 86 marble steps. The lower rooms are used for the deposit of public documents, for the meeting of the trustees, &c.

Since the erection of the building, the number of volumes has increased to nearly 100,000, quite filling the library. These are arranged in classes, that being considered the most convenient and practicable mode. In the selection of the books, the superintendent, upon whom has devolved the whole of this labor and responsibility, has chosen only such works as his experience, and knowledge of bibliography taught him would be most useful to a young and growing country. Particular attention has been paid to the department of technology, in which the library is unusually rich. Bibliography has also received a large share of Dr. Cogswell's attention, his own private collection having been early presented to the library. It is designed to render the department of American history as full as possible, as this class of works are daily becoming more and more required by the American public. In linguistics, particularly oriental, the Astor library is unsurpassed by any in this country. The natural sciences are also fully represented, comprising about 7,000 volumes, many of them rare and costly. In Jan. 1856, the present building having become filled, and the necessity for more room obviously existing, Mr. William B. Astor, eldest son of the founder of the library, made a donation to the trustees of a piece of land immediately adjacent to the present building, embracing an area 80 feet wide, and 120 feet deep. Mr. Astor also announced his intention of erecting a building similar to the present, and to be adapted to the same purposes. Since that date the building has rapidly advanced toward completion, and will probably be ready for the reception of books some time during the year 1858. The whole edifice, when completed, will be capable of containing 200,000 volumes. The catalogue of the Astor library, which has been in progress ever since it was opened, has been a labor of difficulty, and requiring and receiving the most careful attention. It will comprise, when finished, 8 octavo volumes, numbering upward of 500 pages each, 4 volumes being devoted to an alphabetical index of authors' names, and 4 to a carefully arranged catalogue of subjects. It will form, when completed, perhaps the most perfect printed library catalogue ever published. The first volume is already printed, and the others are rapidly passing through the press.

ASTORGA, a city of Leon, in the North of Spain, so called after the Astures, the ancient inhabitants, whose name survives in Asturias. Pop. about 5,000. There is an ancient Gothic cathedral with a high altar of great beauty, the work of Gaspar Becerra. Astorga was taken by Junot in the peninsular war, and retaken by the Spanish general Santocildes. Napoleon made Astorga his head-quarters in his pursuit of Sir John Moore.

ASTORGA, EMANUELE, baron d', a musical composer, born in Sicily, about 1680, died about 1755. He lived for a time at the court of the duke of Parma, whence he went to that of Le-

opold I., emperor of Germany, and afterward travelled over a large part of Europe, living for a year or two in England, and remaining for a longer or shorter time at Lisbon and other places. His principal work is his *Stabat Mater*, the MS. of which is still preserved at Oxford, and of which a large portion is published in Latrobe's "Selection of Sacred Music." His opera of "Daphne" was also highly approved at the time, and his cantatas are elegant and graceful compositions.

ASTORIA, a town, once of great importance, in Oregon territory, near the mouth of Columbia river. It was for a long time the depot of the fur trade for all the country west of the Rocky mountains. It is now the principal place in Clatsop county, and is a port of entry. The difficulties in the entrance to the Columbia have, however, opposed a great impediment to the development of its property, while the more general settlement of the country has caused new towns to surpass it. Its population has been computed at about 800. Its name was given to it in honor of John Jacob Astor. Its early history is described by Washington Irving in his "Astoria." The town dates from about 1810.

ASTORINI, ELIA, an Italian theologian, born in 1651, died 1702, the founder of the academy of the *Fisicritici* at Sienna, and the author of various ecclesiastical writings, left Italy at a very early age, and passed some time at Zurich and Basel, in Swabia, and finally at the university of Marburg, in Germany, of which he was appointed vice-chancellor. In 1686 he graduated as physician at Groningen, but the religious excitement in the Netherlands induced him to return to Rome, where he received the appointment of general predicator at Pisa. He was also for some time professor of mathematics at Sienna, and subsequently became the general commissioner of the monastery of Cosenza. He died in a little place called Terra Nova di Tarsia.

ASTORPILCO, an illegitimate son of Francisco Pizarro and Dona Angelina, daughter of Atahualpa, the last of the Incas of Peru. He died in 1583, but descendants of his name live to the present day in the Peruvian town of Oxamarca, and when Humboldt visited that country he was waited upon in his visit to the old palace of the Incas of Peru by a youth of 17 years, of the same family of Astorpilco, and, consequently, a scion, on the maternal side, of the royal house of Atahualpa. Humboldt gives a melancholy account of the destitute position of this once illustrious family, but while they are on the verge of starvation they still firmly believe in the vast treasures buried under the ruins of the royal palace.

ASTRÆA (Gr. *αστρον*, a star), a genus of radiate animals of the polypi family, which attach themselves to marine bodies, and are often found collected together into a globular or hemispherical mass, known as one of the forms of coral. The upper surface of these

masses is entirely covered with little cavities of stellar form, each one of which is the receptacle of a polype, and in the centre is its mouth, from which radiate its numerous tentacula, or arms. These cavities are either in close contact, or separated by intervening spaces, and this feature is made the basis for dividing the genus into two sections, the first of which is represented by the common East India species, *A. favea*; and the other by the *A. rotulosa* of the West Indies.

ASTRAGAL. I. In Greek antiquity, the bone by which the foot is joined to the leg, the knuckle-bone, or dib, of sheep and goats. What in England is called the game of "dibs," was played with astragals by the women and children of Hellas. A painting by Alexander, of Athens, found at Resina, represents 2 women occupied with this game. One of them having thrown the bones upward into the air has caught 3 of them on the back of her hand, and let 2 fall. Five dibs were employed as in our own day. Cupid and Ganymede are represented playing at dibs on Mount Olympus. II. These astragals were also used as dice by the Greeks, and marked 1 and 6 on one side, 3 and 4 on the other. The 2 ends were left blank. III. From the shape of the sheep-bone, the term astragal was applied by the Greeks to a moulding in architecture, characteristic of the Ionic order. This moulding preserved its name, notwithstanding alterations in its structure which destroyed its original resemblance to the astragal bone.

ASTRAKHAN, or **ASTRAKHAN**. I. An ancient khanate of the Golden Horde of Tartars, embraced Astrakhan proper, Sanatoff, Orenburg, and the Caucasus. It was conquered or annexed to Russia by the czar Ivan Vasilewitch, in 1554. The present government of Astrakhan, in south-eastern Russia extends over about 60,000 square miles between the governments of Sanatoff and Orenbourg, the land of the Cossacks of the Don, the Caucasus, and the Caspian sea. It also extends along both sides of the river Volga, by which it is divided into 2 nearly equal parts. The land is mostly flat, a salt steppe, with frequent salt lakes and swamps, the soil meagre and unproductive, except on the banks of the rivers, and, above all, of the Volga. The climate and vegetation partake of the extremes of northern winter and southern summer. Thus, on good lands, are produced the mulberry, the vine, almonds, peaches, maize, sesame, and even cotton; and among the quadrupeds, antelopes and camels. The population, about 290,000, is composed of Russians, Armenians, Cossacks, Germans, Hindoos, Tartars, Kirgheez, Calmucks. The 3 last are nomads. The Calmucks occupy a separate region called Oblast, and are organized under their own chiefs and laws, printed by the Russian government in the Calmuck language. II. The chief city of the government of the same name, is situated on an island formed by one of the branches of the Volga, about 80 miles from its mouth. The

houses are partly of brick, partly of wood, and the population fluctuates from 20,000 to 50,000, composed of all nations of Europe and Asia, and of nearly all creeds. Thus there are mosques for the Mohammedans and sanctuaries for the Hindoos, as well as Christian churches. There is a naval academy, a high school, or gymnasium, and district and grammar schools, a school and printing-office for the Calmuck language. About 100 manufacturing establishments produce cashmere ahawls, silk and cotton fabrics, furs, dyes, powder, and salt. The salt-works are very extensive. Astrakhan is the great entrepot of the Russian oriental trade, and the raw produce from the remoter regions, consisting principally of hides, sheepskins, and grease, is brought there. It is, accordingly, one of the most flourishing Russian commercial cities. Its fisheries in the Volga and the Caspian sea are very extensive. It is now likewise one of the principal navy depots for the Caspian sea, the lakes and rivers of central Asia. Vessels and steamers are constructed and armed there for the Russian squadrons on all these waters. III. Astrakhan is also the name of a very fine kind of wool or fur, from the so-called sheep of Bokhara, a breed peculiar to Bokhara, Persia, Syria, Palestine, and Egypt.

ASTRAL SPIRITS. The conception of spirits of the stars has come to us from the Persian fire-worship through Judaism and Greek paganism. Every star is supposed to be animated by a spirit. The fancies connected with the sphere and character of these spirits, vary much with the age and country of the demonologist who treats of them. Paracelsus gives every man and woman one such spirit with whom the individual soul is in close connection, and who lives for a short time after the human being with whom it is in connection has died. They flourished under the Christian system. The demonologists of the middle age represent these spirits sometimes as hanging between heaven, earth, and hell, and belonging to neither, sometimes as fallen angels, and sometimes as souls of the deceased. Free scope was always left to the imagination of those who dealt in these wonders. In the 15th century when demonology as an intellectual pursuit became perfected, the astrals were finally enrolled as wicked and evil-doing spirits. The French socialist, Fourier, in his cosmogonical speculations, also supposes the heavenly bodies to be endowed with intelligent individual souls of an order superior to humanity.

ASTRINGENTS (Lat. *astringo*, to contract, or bring together). A class of medicines used either internally or externally, for contracting together the animal tissues and vessels in order to prevent profuse discharges, and also to coagulate the fluid matters. They act topically and in a less degree by sympathy upon other parts; but upon what principle they act is no better understood, than it is how cold applied to the body produces similar effects. Their action is not limited to the tissues of liv-

ing bodies, but is effective upon the dead fibre. It is the astringent property of tannin in oak and hemlock bark and other vegetable substances, which renders them adapted for the hardening of skins by the tanning process. A great variety of vegetable matters contain tannin, and are consequently possessed of astringent properties. The mineral acids and some salts of lead, silver, zinc, iron, and copper, as also carbonates of lime and magnesia, the former in the form of chalk, alum, and acetic acid, are all powerful astringents. This class of medicines applied topically to stop discharges, such as the flow of blood, are called styptics. In the dyeing process the mordants used to fix the colors are astringents, which act by combining with the coloring matters, and forming with them insoluble compounds. Gall nuts and salts of alumina and acetates are common varieties of astringents used for this purpose.

ASTROGNOSY (Gr. *αστρον*, a heavenly body, and *γινωσκω*, to know), the science which treats of the constellations, and the rank of the stars. The best means of gaining this knowledge is by a course on the celestial globe.

ASTROLABE, an old astronomical term, generally applied to a quadrant by which the aspects of the planets were measured, and the earliest measurement of the positions of the fixed stars made.

ASTROLOGY, a system of rules for discovering future events by studying the positions of the heavenly bodies, which was received for many centuries as a true and most important science, but has now lost all credit in civilized nations. It is still practised by a few votaries in western Asia. Astrology was divided into 2 kinds: judicial, by which the fate and acts of nations might be foreknown; and natural, by which the events of brute and inanimate nature—such as the changes of the weather, &c.,—might be predicted. The etymological meaning of the word astrology is almost the same as that of astronomy; and there was no clear distinction made between the 2 branches until the time of Galileo. Previously, most students of the movements of the heavenly bodies had been more or less astrologers. The invention of the telescope, and the establishment of the Copernican system, opened an attractive field for study, and laid the foundation of a true scientific knowledge, while it absorbed the attention of those who might otherwise have devoted themselves to the vain superstition of reading the future in the stars. Ancient civilization saw nothing absurd in the claims of astrology. Prophetic power was supposed to be common. The people imagined that indications of coming events were abundant on all sides of them; and it was presumed that these indications might be fully understood by those who devoted their lives to the study. Augurs and diviners were numerous and respectable; they were classed with physicians and priests; and their scientific rules were supposed to be precise and trustworthy. Omens

were studied by all; and he who spoke of them with ridicule or scorn was looked upon as impious and blind to his best interests. Where such opinions prevailed, astrology was respected as the most abstruse of sciences, and the most trustworthy means of foreknowing the future. Our information in regard to astrology, in ancient as well as in modern times, is not very complete. Having lost its credit as a branch of valuable knowledge, it has been overlooked by historians, or has been passed by with a few words. There was some reason for this mode of treatment, however, in the subject itself; for astrology, although many books had been written upon it—some of them very methodical and precise works—was yet treated so differently by different authors, that a description of their rules would necessarily have been tiresome. Astrology was much practised in imperial Rome. It was forbidden by Augustus, and the edict was republished by 4 or 5 of the later emperors, but was, apparently, not much regarded. Tiberius studied and practised astrology. The Saracens in Spain held star-divination in great respect, and by their influence it was made popular through the rising Gothic nations of western Europe. In the middle of the 18th century, Alfonso the Wise, king of Castile and Leon, made himself not less famous by his astronomical tables than by his code of the *Siete Partidas*; and the astronomical tables were intended principally for astrological purposes. Thus astrology fostered astronomy as alchemy fostered chemistry. Astrology continued to increase in credit till the middle of the 16th century, was still practised at European courts at the end of the 17th, and had a few votaries till the end of the 18th, even in England. It was in high repute at the court of Catharine de' Medici; it was spoken of, by the great Kepler, as a true science; and Lilly, an English astrologer, was called before a committee of the house of commons, in the reign of Charles II., to give his opinion of future events. Lilly was the last of the famous astrologers; the 18th century brought clear scientific ideas, and a cold skepticism, which would even doubt its own eyes when they witnessed phenomena inexplicable by clear rules. As stated before, the rules of the astrologers were different; but the general method of procedure in finding the fate of any man or enterprise, was to draw a horoscope, representing the position of the stars and planets, either in the whole heaven, or within one degree above the eastern horizon, at the time of birth of the individual, or the inception of the undertaking. Arbitrary significations were given to different heavenly bodies, as they appeared singly or in conjunction; and according to these significations, the horoscope was interpreted. The presence of Venus foretold love; Mars, war; Jupiter, power; the Pleiades, storms at sea; &c. The system of a reputable astrologer in the 16th century required years for its mastery; and absurd as its fundamental principles now

appear, its details were not inconsistent with each other, and the whole system has a completeness which appears very singular in a scheme so visionary.

ASTRONOMY (Gr. *αστρον*, a heavenly body, and *νομος*, law), is the science which treats of the heavenly bodies, in their relations to each other and to the earth. The earth is nearly spherical, being about 7,926 miles in diameter at the equator, and 7,899 from pole to pole. It rotates upon its shortest diameter, with a perfectly uniform motion, once in 23h. 56m. 4s., making what is called a sidereal day. At the same time, it revolves about the sun with nearly uniform motion, occupying in its revolution 865d. 5h. 48m. 47.8s. It presents the same side to the sun, on an average, once in 24h., an hour being simply the 24th part of the average solar day. The rotation of the earth upon its axis causes all the heavenly bodies to appear to rise in the east, and set in the west, that is, to rotate about the points in the sky toward which the axis of the earth is directed; in other words, the points which would be directly overhead at the poles. The axis of the earth always points to nearly the same spot among the stars, showing that it remains nearly parallel to itself. But as it is not perpendicular to the path in which the earth is moving round the sun, this fixedness of direction in the axis causes our globe to present itself to the sun in its daily rotation, differently at different seasons of the year, turning the two poles alternately more nearly toward the sun. This causes the sun to appear to us to rise further north in summer, further south in winter, but his course from sunrise to sunset on any one day, is very nearly parallel to his course on any other day. Hence, when he rises further north he remains longer above the horizon, and shines down more nearly perpendicularly at noon, two effective causes of the warmth of summer. The stars move over, from rising to setting, somewhat faster than the sun, that is to say, the revolution of the earth about the sun causes the sun to appear to move round among the stars, and his apparent path among the stars is called the ecliptic. The circle in the heavens, midway between the poles, that is, between the points overhead at the earth's poles, is called the celestial equator. The equator crosses the ecliptic at an angle (about 23° 27' 36") which is called the obliquity of the ecliptic. This angle produces seasons exactly adapted to existing plants and animals. Were it materially greater or less, the whole organic life on the planet would need to be different. The times when the sun apparently crosses the celestial equator, in March and September, are called the equinoxes, because at that time the day is equal to the night over the whole globe. The times when he arrives, in June and December, at his most northern and southern limits, are called solstices, because the sun (Sol) appears to stand for a few days, that is, not to go north or south. The earth's orbit is an ellipse, with the

sun in one focus, so that we are about 8 millions of miles nearer to him at our perihelion, in the northern winter, than at our aphelion—our average distance being about 95 millions of miles. The sun's diameter is about 111 times that of the earth, so that he is 1,400,000 times as large as the earth, though his weight is only 350,000 times that of our planet. The moon bears somewhat the same relation to the earth that the earth does to the sun. She moves about us in an ellipse, her average distance being 238,650 miles. Her diameter is 2,160 miles. Her eclipses take place at full moon, because it is only then that she can ever pass through the shadow of the earth. She produces eclipses of the sun at new moon, because it is only then that her shadow can fall upon us. Her attraction causes the phenomenon of the tides, which are, however, greatly modified by other circumstances. The moon is held in her orbit simply by her weight, that is, the attraction of the earth, and the earth is held in its orbit simply by its weight, the attraction of the sun. No other appreciable force is known to influence the motion of these bodies. Bodies bearing a relation to the sun similar to that of the earth are called planets; those holding a position similar to that of the moon are called satellites. The planets known to the ancients were Mercury, Venus, Mars, Jupiter, and Saturn. To these the moderns have added Uranus, the asteroids, and Neptune. Mercury's distance from the sun varies, in different parts of his orbit, from 29 to 44 millions of miles. He is occasionally seen, just after sunset, in the west. The distance of Venus from the sun is about 69 millions of miles. She is the brightest of the planets. Mars is, in perihelion, about 132 millions, in aphelion 159 millions of miles from the sun. The group of the asteroids lie scattered between 200 and 800 millions of miles from the sun. Jupiter, whose diameter is more than 11 times that of the earth, is about 496 millions of miles from the sun, and is attended by 4 moons, whose eclipses have been of great value in determining longitudes at sea, and have rendered to physics the memorable service of betraying the motion and velocity of light. These eclipses appear to take place 16m. 27s. later when the earth is on the opposite side of the sun from Jupiter; the light being then obliged to cross the orbit of the earth, and thus travel 190 millions of miles further before reaching us, than it does when we are in the part of our orbit nearest to Jupiter. The planet Saturn, at the distance of 909 millions of miles from the sun, is accompanied by a system of rings of fluid matter, held in their position about the planet by 8 satellites. Uranus was discovered by Herschel, in 1781. Its distance from the sun is 1,928 millions of miles, which makes its time of revolution round the sun about 84 years. It is accompanied by 6 satellites. The planet Neptune was first seen in 1846, and one satellite was soon discovered. The existence of Neptune had long been suspected, from the mo-

tions of Uranus, which indicated an exterior attraction, and its place and magnitude were calculated by Adams, of Cambridge, England, and by Leverrier, of Paris, before it had been seen. Its distance does not, however, agree with their calculations, as it is but 2,862 instead of 3,500 millions of miles from the sun. This discrepancy does not arise from any error in their calculation, but from the fact that there were two places in which a planet might have been placed to produce the observed disturbances of Uranus. Leverrier and Adams calculated one place correctly, but it so happened that the planet occupied the other spot. In addition to this train of planets, the sun is attended by a vast host of comets, which move about him at all distances, and in all directions. The comets and planets, however, all agree in these three particulars: they move in ellipses, with the sun in one focus; a line drawn from either of them to the sun would have an angular velocity at the sun, that is, alter its direction in exact proportion to the nearness of the body to the sun; and if the times of revolution of any two bodies round the sun be each multiplied by itself, and the distances of the same bodies from the sun be each multiplied twice by itself, the resulting numbers in the first case will be in the same ratio to each other, as the resulting numbers in the last case. These three facts were discovered by Kepler, and are called Kepler's laws. From these it is easily shown, by higher mathematics, that the only force acting on the heavenly bodies is an attraction toward the sun, proportioned in its intensity to the square of the distance from the sun. It is further shown, by simple arithmetical calculations, that this force is the very same as that which causes an apple to fall to the ground. A stone falls 193 inches in a second, and the moon in going round the earth, at the distance of 238,650 miles, must bend from a straight line .058 of an inch every second. But the moon is 60 times as far from the earth's centre as the stone is, and 193 divided by 60 times 60 gives .058. This discovery of the identity of the force of gravity, or the weight of bodies on earth, with the cosmical force that carries the heavenly bodies in their orbits, is due to Sir Isaac Newton. The bodies already mentioned are all that are known to belong to the solar system, although there are strong probabilities that our own planet, the earth, is surrounded with a vast group of minute satellites, rotating about the earth at a less distance than that of the moon, a discovery of the Rev. George Jones, U. S. N. This asteroid group of terrestrial moons is best seen on fine evenings in February and March, as a faint cone of light stretching up from the west, which has been called the zodiacal light.—The fixed stars are at vastly greater distances from us than any parts of the solar system, and are probably of the same nature as the sun itself. The stars appear to lie in a flattened cluster, with our solar system somewhere near the middle of it. The stars in

the edge of this cluster, of course, appear to us crowded, and the more distant ones are beyond the reach of unassisted sight, their light blending into a whitish cloud, called the milky way. All the stars appear to be revolving about a central point in the constellation of the Pleiades. The change of apparent position in a heavenly body, caused by our moving our position, is called parallax. For the bodies of the solar system there is a daily parallax, arising from our rotation, about the axis of the earth. For the stars the daily parallax is insensible, and even the parallax caused by our moving around the sun, in the immense orbit of 191,000,000 miles in diameter, is so small, that it has with difficulty been measured in a very few stars. Variable stars are those which go through regular periodical changes of brilliancy, from some unknown causes. There are several well-attested instances of the appearance of temporary stars, the permanent accession of new stars to the sky, and the permanent loss of stars which have become invisible. Double stars are simply those which appear to be one nearly behind another. Binary stars are those which are actually near each other and revolve about their common centre of gravity, as the earth and moon about theirs. Nebulæ are clusters of stars, which require very high powers of a telescope to resolve into stars; that is, under low powers of a telescope they appear like portions of the milky way. It is usually supposed that they are large clusters entirely distinct from that in which our solar system is placed, and, if so, at a distance which is incredibly great.—The foregoing remarks give a bird's-eye view of the field of physical astronomy. With this must be combined spherical astronomy, which treats simply of the apparent motions of the heavenly bodies in the sky. The heavens appear like a hollow sphere; one-half, above the horizon, being alone visible at one time. The points over the earth's poles are called the poles of the heavens; they appear stationary, all other parts appear to rotate daily, causing the stars to rise and set. In addition to this, the bodies of the solar system appear to move among the stars on the interior of this sphere. The annual path of the sun is called the ecliptic, and a belt of 8° in width on each side of the ecliptic is called the zodiac, from the pictures of animals (ζῳα) with which it was decorated by the fancy of old astronomers. The apparent motions of all the principal planets (πλανῆτες, wandering) is confined to the zodiac, which is divided into 12 equal parts, called signs: Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius, and Pisces. The comets (κομήτης, long-haired), however, exceed these limits. The apparent motion of the planets is exceedingly irregular, being at times much slower and even backward. When, for instance, we sweep by the planet Mars, and he appears on the meridian at midnight, he will be seen to move westward among the stars,

although, of course, his real motion is eastward. It is the business of spherical astronomy to predict, with accuracy, all the apparent motions of all the heavenly bodies, and thus foretell the times of their rising and setting, and other remarkable phenomena; such as eclipses, when the shadow of one heavenly body falls upon another; occultations, when one heavenly body passes behind another, so as to be hidden from our sight; and transits, when a smaller body passes between us and a larger body, apparently creeping across its face. In the predictions of spherical astronomy, the places of the heavenly bodies are given in right ascension and declination; declination being distance north of the celestial equator, and right ascension being distance east of a meridian, or north and south line, drawn through the first point of Aries, where the ecliptic crosses the equator. For a popular description of the place of a heavenly body, use is made of the constellations, which are very ancient, and somewhat fanciful groups of stars, into which the whole heavens are supposed to be divided.—The history of astronomy is more full and interesting than that of any other science. It cannot be doubted that this science has been one of the greatest means used in the intellectual development of our race, and that it is to the scientific ability developed in the pursuit of astronomy that we owe the origin of all other physical sciences. The movements of the heavenly bodies affect so intimately the welfare of man, that there is scarcely a nation whose earliest traditions do not prove that men began to observe the sun, moon, and stars, as soon as they began to live. It was, however, in Greece that astronomy, as all other sciences, first took a scientific form. The knowledge possessed by the Chaldeans, Egyptians, Indians, and Chinese, seems to have been purely that of observation. The Chaldeans had discovered that eclipses of the sun and moon return at nearly the same times of the year, after an interval of 18 years, and had observed the principal phenomena of the apparent rotation of the heavens. The Egyptians added to this a knowledge of the length of the year, at least so far as to call it 365½ days. The knowledge of astronomy possessed by the Chinese was but little greater. They had determined the obliquity of the ecliptic. The knowledge ascribed by some authors to the Indian nations was probably derived from comparatively modern sources. The astronomical knowledge of all nations in early periods has been magnified by tradition. Substantial proofs of accurate astronomical knowledge are wanting in the case of every nation except the Greeks. Thales, 640 B. C., had undoubtedly many clear and accurate notions. His pupil, Anaximander, born 610 B. C., invented geographical charts, and first announced the sublime idea of the plurality of worlds. Within a century Anaximenes constructed sundials, and Pythagoras, in his early youth a disciple of Thales, gave to his disciples a system

of the universe nearly similar to that of Copernicus. In the year 433 B. C., Meton and Euctemon introduced the Metonic cycle, which for ages furnished the means of calculating the age of the moon and recurrence of eclipses. Plato, by his diligent cultivation of geometry, rendered very essential service to the progress of astronomy, not only in his own, but in all future ages. Astronomy did not, however, begin to be cultivated as a professional science, until the establishment of the museum at Alexandria by Ptolemy Philadelphus; an institution which survived for 9 centuries. The discoveries of this Alexandrian school, both in astronomy and in geometry, are too numerous for us to give in detail. We cannot, however, omit to mention that Eratosthenes, born 276 B. C., first measured the size of the earth, by that process which is to the present day considered the best: the measurement of an arc of the meridian. But men of other schools were not idle. Hipparchus, born 140 B. C., verified, at his private observatory at Rhodes, the results of the Alexandrians, and then himself pushed on until he had made more observations and discoveries than any of the ancient astronomers. Stimulated by the sudden appearance of a new star in the heavens, he formed a catalogue of 1,080 stars, and discovered the precession of the equinoxes. His astronomical studies led him also to some valuable results in pure mathematics. Indeed, the whole history of these 2 sciences to the present day shows that while astronomy can make no progress without mathesis, mathesis would have advanced much more slowly but for the stimulus given to it by the problems of astronomy. Nearly 8 centuries after Hipparchus, Ptolemy appeared at Alexandria, and earned a high rank, not only by his own discoveries and inventions, but by his valuable history of the labors of his predecessors. This work was for a long time the great standard of astronomical knowledge, and is still extant in Greek, in Latin, and in Latin translated from the Arabic. The Arabic name *Almagest*, corrupted from the Greek for "the greatest," is the ordinary title of Ptolemy's *Μεγάλη Συναγωγή*, or "great composition." On the death of Ptolemy, astronomy ceased to be cultivated among the Greeks. The Arabians, Persians, and Tartars, preserved a knowledge of that which had been done in Alexandria, and made many valuable observations, but added nothing to the theoretical science. In the 13th century, the science began to revive in Spain; and in the 15th century, Purbach at Vienna, and his celebrated scholar, John Müller, better known by the name of Regiomontanus (Latinized from his birthplace, Königsberg), firmly established it among the Germans. Copernicus, born 1473, was the first of modern astronomers to restore the Pythagorean view of the universe, namely, that the stars and the sun are at rest, the planets revolving about the sun, and the moon about the earth. Tycho Brahe, born 1546, did not accept the views of Copernicus, but he was a most indefatigable

and skilful observer, and being possessed of ample fortune, manufactured costly and accurate instruments. His accurate observations furnished his disciple, Kepler, born 1571, with the means of proving those three great truths called Kepler's laws, which are in themselves the sum of all the observations that have ever been made upon the heavenly bodies. They are equivalent, as mere expressions of the facts of motion, to Newton's law of gravity, and are competent to explain every motion which gravity itself can explain. The Italian, Galileo, born 1564, by his invention of the telescope, and his discovery of the value of the pendulum as a recorder of time, rendered also invaluable services to astronomy. But equally valuable and wonderful was the invention by Napier, or Neper, in 1614, of logarithms, without which astronomical calculations, of the delicacy and intricacy requisite in the modern state of the science, would be absolutely impossible. Huyghens, born 1629, aided astronomy by his improvement in telescopes, clocks, and chronometers. Cassini, born 1625, was an indefatigable and accurate observer. Newton, born 1642, deducing the law of gravity from Kepler's laws, and inventing the mathematical science of fluxions, earned the highest place among the list of theoretical astronomers. Flamsteed, Halley, Bradley, in England, Lacaille, and the later Cassinis in France, pushed observations to greater degrees of accuracy. With Leibnitz's calculus, the same in spirit, but different in form, from Newton's fluxions, the mathematicians commenced that series of brilliant investigations into the laws of attraction, which rendered Clairaut, born 1713, D'Alembert, born 1717, Euler, born 1707, Lagrange, born 1736, and Laplace, born 1749, so glorious. Among these, Euler and Lagrange were undoubtedly men of the highest genius, but Laplace, by the multiplicity, accuracy, and value of his labors, has gained an equal fame. Astronomy in the 19th century has continued to advance. Telescopic discoveries continue to be daily made, and living analysts are equal in their achievements to the illustrious men of the 18th century. Herschel's discovery of Uranus in 1781 was an accident, but that of Neptune in 1846 was the result of calculations by Leverrier, and must be ranked among the finest triumphs of the human intellect. The discovery of so many asteroids is wholly a work of this century, begun in 1801, but chiefly carried on during the last 10 years. The measurement of the distance of some of the fixed stars from the sun was also reserved for the middle of the 19th century, to shed glory on Bessel of Königsberg. The delicacy of this operation may be inferred from the consideration that if a model of the universe were constructed on a scale of 10,000,000 miles to an inch (so that the sun should become a shot, .08 of an inch in diameter, the earth's orbit be 19 inches in diameter, and that of Neptune be less than 50 feet across), the nearest fixed stars would still be

80 miles distant. In other words, modern astronomy undertakes to determine the distance of bodies which are from 80 to 40 miles off, by measuring a base line of 19 inches, and observing the bearings of the objects taken at each end of the base. The determination of the fluidity of Saturn's ring deserves also to be ranked among the marvellous triumphs of genius. Saturn's ring, first seen by Galileo, was observed for two centuries and a quarter as a solid body. Mr. G. P. Bond, of Cambridge, Mass., having suggested that it was fluid, Prof. Benj. Peirce investigated anew the problem of the motions of a ring about a planet, and showed that a planet could not, of itself, sustain either a solid or a fluid ring, and that satellites could not sustain a solid ring under any circumstances, nor a fluid ring except under certain conditions, which are fulfilled in the case of Saturn.—Astronomy at the present day is zealously cultivated in nearly all the civilized states of the world. The observatories of Greenwich, Cambridge, and Oxford, England, and Edinburgh in Scotland, of Paris in France, of Berlin and Königsberg in Prussia, of Altona in Denmark, of Dorpat and Pultowa in Russia, of Cambridge, Mass., Washington, D. C., Cincinnati, Ohio, and Albany, N. Y., are among the most celebrated for the number and excellence of their observers and their instruments. In America, astronomy has almost begun its existence since 1848, when public interest was awakened by the sudden appearance of a large comet, and men of wealth were induced to offer to men of science the means of purchasing instruments, and maintaining observers. Previous to that period, the chief contribution which our countrymen had made to this science was the translation by Dr. Bowditch of Laplace's *Mécanique Céleste*. Since that time, three valuable observatories have sprung into vigorous life, an astronomical journal has been established, whose articles have been of the highest character, and an American ephemeris, or nautical almanac, has been started, which is confessed by high English authority to combine the excellences of all European works of the kind with peculiar advantages of its own. Our countryman, Mr. Alvan Clark, has also produced telescopes pronounced, by all competent judges, fully equal to the best in existence. The mechanical and inventive genius of Americans has also within a few years added greatly to the efficiency of methods of observation. The electric telegraph has been ingeniously employed for making instantaneous records of observations on a revolving cylinder in Cambridge, moving uniformly, being connected with the movements of a pendulum clock by an elastic axle capable of being twisted, which allows the cylinder to continue to move during the dead beat of the escapement; on a revolving disk in Cincinnati, regulated by its own inertia, as a fly wheel, and prevented from gradual acceleration, by an ingenious application, once a second, of a triangular tooth into a triangular opening

on the edge of a wheel. Two distinct methods, each cheap and simple, are also in use, one in Cincinnati, and one in Cambridge, whereby accurate measurements of small arcs are made with vastly more rapidity than by the costly and complicated heliometer, and with equal accuracy.—For a popular view of astronomy, any of the numerous elementary text-books may be taken. For a rather more complete treatise, Sir John Herschel's "Outlines" may be recommended. A thorough knowledge of physical astronomy would require an acquaintance with such works as Laplace's *Mécanique Céleste*, translated by Bowditch, Gauss's *Theoria Motus Corporum Cælestium*, translated by Commander C. H. Davis, U. S. N. (Boston, 1858), Delambre's *Astronomie*, or Peirce's "Analytical Mechanics" and "Celestial Mechanics," now in the course of publication. For the history of astronomy, see Whewell's "History of the Inductive Sciences," Grant's "History of Physical Astronomy," Jahn's *Geschichte der Astronomie*, and Delambre's *Histoire de l'Astronomie*. For full information concerning the modern history of astronomy, Zach's *Monatliche Correspondenz*, Lindenau's *Zeitschrift*, Schumacher's *Astronomische Nachrichten*, continued by Dr. Peterson, and Gould's (American) "Astronomical Journal," must be consulted; also, the French *Connaissances des Temps*, which contain Leverrier's discussions that led to the discovery of Neptune, the Berlin *Jahrbuch*, the Milan *Epheméride*, and the American "Ephemeris and Nautical Almanac."

ASTROS, PAUL THÉRÈSE DAVID D', cardinal archbishop of Toulouse and Narbonne, born at Tourves, in the department of Var, Oct. 15, 1772, died Sept. 29, 1851. In 1807, he delivered a celebrated sermon on the re-establishment of religion in France, in which Napoleon was complimented. As an ultramontane and utterer of the pope's bull of excommunication against Napoleon, he was arrested, and remained incarcerated in Vincennes until 1814. The educational ordinances of 1828 received his most determined opposition, as being dangerous concessions to the latitudinarian liberals. He has left the world several treatises on theological and politico-ecclesiastical subjects.

ASTRUO, JEAN, a French physician, born at Suave, in Bas Languedoc, March 19, 1684, and died May 5, 1766. He was celebrated in his day as an erudite physician and professor, the author of innumerable volumes, and a violent partisan of the exploded medical doctrines of the iatro-mechanical school of physiology. He received his degree of doctor of medicine at the age of 19; was professor of medicine at Montpellier first, then at Toulouse, and afterward at Paris. He wrote controversial works on numerous diseases, and one in which he maintained that the pestilence which broke out at Marseilles in 1720 was contagious, in opposition to the views of other medical authorities. He also espoused the cause of medicine against

urgery, in a controversy with regard to the preëminence of one over the other.

ASTURIAS, an ancient province (now Oviedo) in the north of Spain, on the bay of Biscay, which gives a title to the crown prince of Spain. In the south of the province is a range of mountains almost as high as the Pyrenees, and sometimes called the Asturian Pyrenees, but, like other mountain ranges of Spain, changing their names frequently. The loftiest of these is the Sierra Penaranda, 11,000 feet high. The precipitous bluffs of Cape Ortegal terminate this mountain range in one direction; in the other it crosses the neighboring province of Galicia; and in the gloomy rocks of Cape Finisterre, opposing their eternal barrier to the full sweep of the turbulent Atlantic, we find another terminal point. The mass is composed of calcareous rocks, marble, and hard grit sandstone, and various mineral productions are found, including copper, mineral amber, cinabar, iron, zinc, lead, antimony, and jet. There are also beds of coal which are worked, and of which about 5,000 tons are sent into other parts of Spain. There is a hot spring at Las Caldas, near Oviedo. There are several rivers, none of considerable size, which, rising in the hills, flow north into the sea; the principal are the Sella, the Nalon, the Navia, and the Eo. Among the vegetable products are the oak, beech, and chestnut. There are various plants useful in medicine—hellebore, sarsaparilla, angelica, and dulcamara. Orchil is found on the seashore. The agricultural productions are nuts of various kinds, apples, and pears. Considerable quantities of cider are made, enough, indeed, for exportation to South America. The vine is cultivated, but not so extensively as in other parts of Spain. Indian corn is extensively grown, and a corn called spelt wheat, or *escanda*, to which the Asturians are specially partial. Oranges and lemons are grown in some parts of the province in the open air. Wild animals, including bears, wolves, and foxes, are plentiful in the mountains. The inhabitants are hardy and industrious. They are good farmers, and the numerous well-watered valleys spread all over the rugged surface of their country, give an excellent opportunity to their industry. Many of them travel to other parts of Spain and take service, for which their steady habits especially qualify them, and return in after years with their savings, to spend their lives at home. Santander is the only seaport, and the foreign commerce is insignificant, the internal communications being bad, and the few surplus productions of the province finding a market in the country; but the bold coast is everywhere indented with small bays and creeks, and the Asturians follow up fisheries, both salt and fresh water, with activity, and their commodity finds a ready market in the interior. There are a few manufactories, but of no great importance. The mountain fastnesses and defiles of Asturias afforded a safe refuge to the Gothic inhabitants of Spain, who were able to retire thither before the Mos-

lem invaders, and from thence Pelayo and his warriors continually harassed the Moors, who never succeeded in gaining a footing in the province. From a very early period the Asturians had their constitution and privileges. The Asturians boast that they are all noble, descended from the pure aboriginal Celtic stock, and have never been contaminated by intermixture with any of the foreign invaders and conquerors of the peninsula. In the Carlist struggles, the Asturians were generally faithful to the cause of Don Carlos. The principality is divided into 118 *concejos*, or communes, and 50 towns, all of which have their local government unimpaired. The population is about 500,000. The general government of the province is vested in the governor, intendant, and audiencia. The celebrated university of Oviedo is in this province.

ASTYAGES, the son of Cyaxares, became king of Media, according to Herodotus, on the death of his father-in-law Alyattes, in 595 B. C., and reigned 85 years. In consequence of a terrific dream, he married his daughter Mandane to a Persian noble named Cambyses, and in consequence of another dream equally alarming, he sent Harpagus, one of his courtiers, to compass the destruction of the child that was the offspring of that marriage. The infant was consigned to a shepherd to be exposed, but the shepherd, instead of fulfilling his commission, brought him up as his own son; that infant was Cyrus, the future founder of the empire of the Persians. Astyages having discovered in time that the boy still lived, caused a savage and shameful punishment to be inflicted on Harpagus, who in revenge incited Cyrus, when he had grown to manhood, to declare war against the tyrant. A battle ensued in which the Medes were defeated, and Astyages taken prisoner. Cyrus then ascended the throne, and the cruel Astyages remained a captive till his death.

ASYLUM, the Latin form of the Greek word *ασυλον*, of doubtful derivation, a place of refuge, from which persons who fled to it could not be taken without sacrilege. The Jewish cities of refuge established by Moses and Joshua, are the earliest examples of the custom of which we possess historical evidence. These were 6 in number, 3 on each side of the river Jordan. Thither the involuntary homicide might flee and escape the vengeance of the people or the relatives of the deceased. In Greece, the temples, the groves, the altars, and sometimes the precincts of the temple, were asylums to men convicted or indicted for civil or criminal offences. Yet it was lawful to surround the temple, and let the poor wretch inside die of hunger, and even in some cases to set fire to the building. In the later days of Rome, the eagles of the legions, and the statues and palaces of the emperors, were also asylums. The strongest religious sanction was thrown around these places of refuge; a whole district, it was believed, would be visited by the divine

vengeance, if it permitted a violation of the right of sanctuary, and also of the rights and privileges of the particular god or goddess at whose shrine the criminal or debtor had taken refuge. Insolvent debtors and runaway slaves resorted to them in great numbers. As law became more powerful under the Roman government, these asylums came to be regarded as nuisances and impediments to the due administration of justice. The Roman senate summoned a number of asylums to show by what warrant they claimed to possess the privilege. All those which could not show a perfect and continuous title, were abolished. At last an edict of the emperor Tiberius swept most of them away, both legal and pretended. With the barbarian incursions in the East and West, it was natural that the necessity for asylums would arise again in consequence of the general retrogression of society. The new right of asylum fell naturally to the Christian churches. Under Constantine the Great, all Christian churches were asylums; the younger Theodosius extended the privilege to all courts, gardens, walks, and houses belonging to the church. The Franks in France, and Visigoths in Spain, permitted it. Many of the popes favored this right, as it conferred great power on the clergy, who were probably in a time of savage violence the best class to entrust with the trial of causes. All convents, and even bishops' houses, became asylums. Opposed to the right were the temporal lords, the rights of whose jurisdiction were curtailed by the asylums. Several popes, in particular Gregory XIV. and Benedict XIII., restricted the right as narrowly as possible. All highway robbers, voluntary homicides, horse or sheep stealers, professional thieves, heretics under inquisition process, those who laid violent hands on nobles, forgers, false coiners, and duellists, were excluded from the privilege. In Germany, where the temporal power was strong, and the spiritual arm weak, the right of asylum was never very effective. Sometimes, however, the German barons would themselves set up the right of asylum in their castles. The German Kaisers never regarded the ecclesiastical asylum, and it was entirely swept away by the Protestant princes. In England, in the year 1487, the right was for the first time restrained by a bull of Pope Innocent VIII. In 1584, after the reformation had commenced, persons accused of treason were debarred the right of sanctuary, which word is more commonly used in English law than asylum, and hence the phrase, "to take sanctuary," is equivalent to take refuge. In the time of Queen Elizabeth, the right of asylum was taken away from all criminals, but reserved to debtors, which, in a time when life-long imprisonment for debt was allowed, may well be considered a humane provision. In 1697, the right of asylum was at length taken away from insolvent debtors. In Scotland, to this day, Holyrood palace, as an ancient royal residence, continues to retain this right with respect to the persons of debtors. The bound-

aries of this place of refuge are liberal; the debtors find lodgings in a short street, the privileged part of which is divided from the unprivileged by a gutter running across it. This is the only existing sanctuary in the British empire. In the United States of America, no civil or ecclesiastical asylum has ever existed. To Macduff, thane of Fife, who dethroned Macbeth, and to his descendants, was given by Malcolm Kenmore, on the recovery of the throne of his ancestors, the privilege for any one of the clan Macduff who committed unpremeditated homicide, to have his punishment remitted for a fine, payable to the injured family, if he could get safe to Macduff's cross, which stood in Fifeshire. Many similar privileges were granted by charter in Scotland. The right of asylum endured longest in Italy, and was first put an end to by the French occupation in the last century. The houses of the clergy, and graveyards, became asylums in Italy in course of time. At the present day, the houses of the cardinals at Rome have this privilege; but criminals are generally surrendered to the civil power. The public policy of this right was long a subject of contention between the clergy and the poor people on one side, and the kings, lay lords, middle classes, and civil lawyers on the other. In a time of rude violence, when Lynch law, and the *lex talionis*, prevailed, an innocent man often got protection from lawless passions, by running to the clergy for refuge; as society advanced, and the arm of the law became both strong and sure, the right became only a means of sheltering criminals from due punishment, and dishonest debtors from injured creditors.—In England and America this name has been given to charitable institutions for the relief of orphans, the blind or dumb, and widows of poor officers or clergymen, and similar institutions.

ASYMPTOTE, a line (straight or curved) tangent to a curve, but having its point of contact with the curve at an infinite distance. If a weight were hung upon a cord, the ends of which were fastened to pins at unequal heights, the weight would slide to a point nearer the lower pin. Let now the cord gradually yield to the weight, and be stretched to an indefinite length, the weight, sliding constantly toward the middle of the cord, would move in a curve; and a vertical line midway between the pins would be an asymptote to that curve. An asymptote always approaches without ever meeting its curve; a beautiful type, says Leibnitz, of the progress of a soul toward God.

ASYNDETON, a rhetorical term, denoting the omission of connecting particles in animated discourse.

ATABAPO, or **ATACAVI**, a river of Venezuela, rising in lat. 8° 10' N., long. 66° 44' W., and flows westerly some 80 miles to its junction with the Temi, where it turns northward for about the same distance, and discharges its waters into the Guaviara, a little above its junction with the Orinoco, near the

San Fernando de Atabapo, a village of about 300 inhabitants. The Atabapo is a very beautiful stream. Humboldt, in visiting it, was surprised by the great transparency and purity of its water, in which small fish and the bright quartz pebbles, of which its bed is composed, are visible at a depth of 20 or 30 feet. The waters are also very cool and agreeable to the taste. Among its fish are bavas and fresh-water dolphins.

ATABEK, a title of honor given to certain ministers and viziers by the Seljook dynasty of the sultans of the East. It means "the faithful parent." These dignitaries were the rulers of various provinces of the empire, in which they established a dynastic viceroyalty, exercising all the rights of sovereignty except that the name of the nominal sovereign was added in the ritual of public prayer. The atabeks of Syria and Irak, 1086-1183; of Azerbaijan, 1186-1235; of Fars, or Persia proper, 1148-1264; and of Laristan, were the principal governors.

ATAOCAMA, a province of Bolivia, lying on the Pacific, directly south of south Peru. Its principal town, Atacama la Alta, is situated in lat. 23° S., long. 68° W., at the base of the Andes. It is about 290 miles in length and 150 in breadth. Cobija, the only seaport of Bolivia, is within the bounds of the province. It is very thinly peopled, and although the northern part has some fertile valleys, the greater part of the province is a sterile, and dreary desert. The interior of the desert is entirely uninhabited, and the whole number of dwellers upon the coast does not exceed 200. The men derive a precarious support from fishing. During the winter the sea is often for a long time too stormy for them to trust themselves upon it, and they then hunt any animals which the cold and snow may drive down from the mountains. The women tend flocks of goats in the infrequent meadows; and the men and women often change their residences and live apart, the former going from creek to creek, and the latter from valley to valley. This desert has been for ages the burial-place of the aboriginal Peruvians. Owing to the dryness of the climate and the soil, which is a mixture of sand and salt, bodies deposited here do not decay, but are preserved like mummies. Anhydrous sulphate of soda is abundant in almost every part of the district, and large masses of solid iron have also been found in different localities. There are warm medicinal springs in the northern part. Lieut. Gibbon at one point found 2 streams uniting, whose temperatures were 70° and 107° F. Gold, silver, copper, salt, and alum, are also among the mineral products of this country. The vicuña and the American ostrich are abundant. The volcano of Atacama, 18,000 feet in height, is in lat. 21° 35' S., long. 69° 15' W.

ATAHUALLPA, or ATABALIPA, Inca of Peru at the time of the invasion of the Spaniards, died

Aug. 29, 1533. He was the son of Huayna Capac. The laws of Peru required that the principal wives of the Incas should be blood-relations, and that no children of other parentage should be legitimate. Atahualpa's mother had been a princess of Quito; nevertheless, at the request of his father, the heir to the throne, Huascar, consented to resign his rights in favor of Atahualpa, on condition only that he should render homage to him, and not make conquests beyond his own kingdom. This liberal conduct was, however, infamously requited by Atahualpa, who, having secretly got together a large army, attacked his brother Huascar in Cuzco, took him prisoner, loaded him with chains, and exterminated all his adherents, putting his family and immediate dependents to death in the most atrocious tortures, at which the wretched Huascar was compelled continually to be present. Such, at least, is the story told by Spanish annalists, whose testimony is, however, doubtful, seeing that the murder of Huascar, their pseudo-ally, and the tyranny of Atahualpa, were among the causes of his own execution. If his ingratitude and treachery were really true, a terrible retribution was at hand. Pizarro and his followers were now in Peru, and Atahualpa hearing that his father had sent to them, opened negotiations with them himself. His proposals were received in a friendly manner by Pizarro, and an interview was arranged which Atahualpa attended followed by a very large number of unarmed subjects. Father Vicente de Valverde explained to him, through an interpreter, the mysteries of religion, and that on account of their heathenism the pope had granted his kingdom to the Spaniards. Atahualpa professed not to understand the tenor of this discourse, and could not at once resign his kingdom; whereupon a massacre of the assembled crowd was at once commenced by the Spanish soldiers, who seized Atahualpa and threw him into prison. On the arrival of Almagro the cupidity of the adventurers was excited by the magnificent proposals that Atahualpa made for his ransom, and with a desire of seizing the whole it was determined to put Atahualpa to death. Some of the more merciful of the Spanish leaders were disinclined to this extremity, and proposed to send him to Europe for the emperor to decide on his fate. But the counsels of the more unscrupulous party prevailed, and he was tried by a military commission. During his imprisonment Atahualpa's influence with his own people was undiminished, and his rancorous hate against Huascar being unslacked, his orders to put Huascar to death were obeyed. This was one of the charges against him on the court-martial by which he was tried, and being found guilty he was sentenced to be burned, a penalty commuted for strangulation by the garotte on his accepting baptism at the hands of the priests accompanying the invaders. (See Prescott's "Conquest of Peru," vol. i., p. 486.)

ATAIDE, Louis de, Count d'Attouguia, a

celebrated Portuguese statesman, born in the first half of the 16th century, died at Goa, March 9, 1581, was a lineal descendant of Joao Goncalves Zarco, the first explorer of the island of Madeira. In 1568 he was appointed viceroy of the Portuguese possessions in India, and was so successful in defeating the Ottoman armies which had invaded Chaul, that on his return to Lisbon his reception by the king and people of Portugal was a perfect ovation. On Oct. 16, 1577, he returned to the Indies to resume his vice-regal office, but the peace which had been concluded with the Ottoman king did not give him any further opportunity to add new victories to his laurels.

ATALANTA, a mythical personage, who may have been either a native of Boeotia or a native of Arcadia. The more authentic legend is that she was an Arcadian, and the daughter of Iasus, who, having prayed to the gods for a son, was displeased at her birth, and, as a mark of his displeasure, exposed her on the Parthenian mount. Here she was nurtured by a she bear, and grew up to womanhood, still, however, retaining her virginity, and becoming the most swift-footed of mortals. She vanquished the Centaurs, who sought to capture her, participated in the Calydonian boar-hunt, and engaged in the Pelian games. In course of time her father was reconciled to her, and restored her filial rights to her; but when he urged her to choose a husband, she insisted that every suitor who aspired to win her should first contend with her in running. If he vanquished her he was to receive her hand as the prize of victory; if vanquished, he was to be put to death. Milanion overcame her by practising the following artifice: as he ran he dropped 3 golden apples, the gift of Venus, one after the other, along the course, which so fascinated Atalanta that she could not refrain from delaying to pick them up, and while she thus delayed she was vanquished.

ATALAYA, a town on Canary island, near Las Palmas. It is only remarkable for the curious manner in which the inhabitants live. All the houses are excavated in the sides of Mt. St Antoine, in which the people of the town live like bank-swallows. Pop. 2,000.

ATARAIPU, a lofty pyramidal rock in British Guiana, lat. $2^{\circ} 55' N.$, long. $58^{\circ} 48' W.$ It is situated near the Rupununy river, and has an altitude of 900 feet above the savannah on which it is situated, and 1,800 feet above the sea level. "For 850 feet above its base," says Schomburgk, "it is heavily wooded, but above this point it towers up in a pyramidal form 550 feet more, a solid mass of naked granite." The meaning of the name is "devil's rock."

ATARUIPE, a cave on the declivity of a steep mountain near the mission of Atures in Guiana. In this cavern Humboldt found nearly 600 skeletons in good preservation, and arranged in good order upon a sort of baskets, made of the petioles of palms. All the skeletons were bent and entire.

ATAUAI, or KAUAI, also written ATOOI and ATUI, one of the Sandwich island group, lat. $22^{\circ} 8' N.$, long. $159^{\circ} 20' W.$, 240 miles N. N. W. of Hawaii. The form of the island is somewhat oval, 40 miles in length and 24 in breadth at its widest part. The central portion is a high plateau intersected with deep, fertile valleys, and having elevated peaks rising from its surface to the height of 7,000 feet above the level of the sea. From this central plateau it slopes on every side to the sea, and terminates in a bold shore. Hanalei and Waimea are its principal ports. The population in 1858 was 6,988.

ATAULPHUS, the second king of the Visigoths, and successor to Alaric (410), to whom his sister was given in marriage, and founder of the Gothic kingdom of Gaul. He joined Alaric in Italy (409) with an army of Goths and Huns, and aided him in the siege of Rome. After the death of his brother-in-law, Ataulphus marched into Gaul, carrying with him Placidia, the sister of the emperor Honorius, a captive. The Gallic provinces of the empire were then in dispute between Jovinus, who, at the head of a mixed army of Burgundians, Alemanni, and Alani, had temporarily possessed himself of them, and the emperor Ataulphus offered to treat with Jovinus and share with him the spoils. To this proposition Jovinus was little inclined to listen. The Gothic king, therefore, turned his attention to Honorius. Offering him terms of peace he at the same time attacked and defeated Jovinus, and put him to death. Honorius now demanded the return of his daughter, who had been espoused to Constance. Instead of returning Placidia, Ataulphus, by her own consent, married her. This was an era in the life of Ataulphus, and in the social history of the Gothic kingdom of Gaul. But all the efforts of the barbarian king to reconcile himself to Honorius were of no avail. Constance, smarting under the wrong which had deprived him of alliance with imperial blood, harassed the peace of the Gothic kingdom, until (414) the barbarians were compelled to evacuate the territory, burning Bordeaux as they left. Ataulphus, who, it is said, had already become obnoxious to the hatred of his subjects, by his cruelties, or his zeal at reform, was assassinated by one of his equerries in the year 415.

ATBARA, the principal eastern branch of the Nile. It rises in central Abyssinia, among the Lasta mountains, a little to the east of Lake Tzana, one of the sources of the Blue Nile. Pursuing a mainly north-easterly direction, it forms the boundary between Amhara and Tigre, cuts the southern part of Nubia, and, after receiving many tributaries, enters the Nile at lat. $17^{\circ} 45' N.$, and long $34^{\circ} 5' E.$ Through the latter part of its course it traverses the lowlands of Walhuba and Walkayt. When Burckhardt visited it in 1814 he was struck with the luxuriant vegetation which lined its banks, and the caravan were so impressed with the beauty of the scene, that, in allusion to the dreary tract over which they had just passed, one of them

exclaimed, "After death comes paradise." On the shores of this river, near Goz Rajeb, this distinguished traveller saw the ruins of some ancient building of huge dimensions, but was deterred from exploring it by the assurance of his guides that it was the haunt of banditti. The Atbara is mostly fordable, and abounds in crocodiles and hippopotami. It is about 800 miles in length.

ATCHA, written also ATTU, ATOHU, ATCHAM, ATCHAK, ASHKA, and ATSOHAK, one of the Aleutian isles, lying in N. lat. about 58°, E. long. 175°, about 10 miles wide and 70 long. It has a volcano in the eastern part, which constantly emits a sulphureous discharge, and a hot spring at its foot. There is a harbor at the east extremity. Pop. about 60.

ATCHAFALAYA, a river and bayou of the Mississippi river in the state of Louisiana, connecting with that river near the northern line of the state, but receiving very little of its waters except in time of flood. Its course is nearly southward to the lake Chetimaches, through which it passes, and from which, in a greatly enlarged stream, it discharges itself into Atchafalaya bay. Its name signifies lost river, and it is supposed by geographers to have formed the old bed of the Red river, which probably at one time found its way to the gulf of Mexico as an independent stream. The Teche and Courtaubien are its principal tributaries. Its whole course is about 260 miles.—ATCHAFALAYA BAY, a bay on the southern coast of Louisiana indenting the delta of the Mississippi, and receiving the waters of Atchafalaya bayou and Lake Chetimaches.

ATCHISON, a county of Missouri, forming the N. W. extremity of the state, lying along the left bank of the Missouri river. It is drained by the Nodaway, Tarkeo, and Nishnabotona rivers, and contains 695 square miles, and a population of 1,678, only 80 of whom are slaves. Indian corn, wheat, oats, cattle, and swine, are the staples. In 1850 this county produced 149,887 bushels of corn, 15,577 of wheat, and 9,783 of oats. There were 175 pupils attending public schools. The live stock was valued at \$77,284.

ATCHISON, DAVID R., an American senator, born Aug. 11, 1807, at Frogtown, Fayette county, Ky. The son of a wealthy farmer, he was educated for the bar, and emigrated to Liberty, Clay county, Missouri, in April, 1830, where he engaged in the practice of his profession. He was a bachelor, a man of convivial and social habits, and became very popular with the early settlers in that region. He was elected to the legislature from Clay county in Aug. 1834, and again in 1838. In Feb. 1841, he was appointed judge of the circuit court for Platte county. Upon the death of Mr. Linn, U. S. senator, in the autumn of 1841, Mr. Atchison was appointed to the vacancy by Gov. Reynolds. It was thought by many that this appointment was merited, and had been recommended by Col. Benton and other au-

thorities of the democratic party; by many others it was said that the governor was himself ambitious of the senatorship, and had selected Mr. Atchison as a person who could easily be beaten at the next election. The death of Gov. Reynolds, however, occurred before the meeting of the legislature, and Mr. Atchison was elected without serious opposition. He was re-elected for 2 full terms, the last of which expired March 4, 1855. When he entered the senate he acted cordially with Col. Benton, and as late as 1848 claimed that he was the first to frame an act organizing the territory of Oregon with a clause prohibiting slavery. The next year he attached himself to the party of Mr. Calhoun, was elected president *pro tem.* of the senate, was received into favor and raised into prominence by his new party, and became the antagonist of Col. Benton in his own state. The union of a few democrats under the lead of Mr. Atchison, with the whigs, defeated Col. Benton in 1850. Mr. Atchison became especially prominent in the legislation for the organization of the territories of Kansas and Nebraska. The first bill which was introduced into congress to this end was in the winter of 1851-'52, and had no reference to the subject of slavery. This bill Mr. Atchison advocated by a speech in the senate, but subsequently on his return to Missouri he became an opponent of the bill, and declared in a public speech that he would never vote for the measure unless the Missouri compromise were repealed. The public sentiment at that time was such that his declaration was denounced by the papers of his own party; but within a month from the opening of the next congress, Mr. Douglas, from the committee on territories, reported a bill to organize these territories, containing a clause which, by strong implication, repealed the Missouri compromise, although the report accompanying the bill expressly deprecated any such intent. This clause was assailed by Messrs. Chase, Sumner, and others, in a printed circular, which led to a vehement and personal debate. There was, finally, substituted another clause which repealed the Missouri compromise outright, and in this shape the bill was passed. Subsequently Mr. Atchison affirmed, in a speech made in the territory of Kansas, that the clause repealing the Missouri compromise originated with him; that he had proposed it to Mr. Douglas, who at first declined to insert it in his bill, but after a period of hesitation consented to do so. This account tallies with public facts, and though it was published in the newspapers was not denied by Mr. Douglas. Mr. Atchison, since he lost his seat in the senate, has been a leader and chief adviser of the slavery party in the recent troubles in Kansas. He now resides on a fine farm in Clinton county, Missouri.

ATOHUJEFF, or ATOHUEFF, an island at the mouth of Tchernof-Protok, the black current into the Azof sea, opposite Yenikale. It is a spot occupied principally by fishermen for the preparation of caviare.

ATE, a Greek deity, daughter of Eris, or Zeus. She plays very different parts in the tragic and epic poets. In the former she is the punisher of those who perpetrate crime, in the latter she is the instigator of gods and men to rash and pernicious deeds, which superinduce suffering and sorrow. In this character she persuaded Zeus to take an oath, which afterward enabled Hera to transfer to Eurystheus the power that had been intended for Hercules. When Zeus perceived what he had done, he cast Ate from Olympus, and excluded her forever from the society of the gods. Ate figures most prominently in the poems of Homer and the tragedies of Æschylus.

ATELLANÆ FABULÆ, Atellane plays, a species of farce or comedy, so called from Atella, a town of the Oscans in Campania, southern Italy. From this fact, and also from their being played in the Oscan tongue, they were sometimes called *ludi Osci*. No entire play has come down to us. They were introduced into Rome, and were received with as much favor there as the negro melodies have been in New York. The Oscan dialect was easily intelligible to the educated classes of Rome, and the *Atellane* were allowed to be performed by Roman citizens without degradation and loss of civil rights. The humor of the Oscan plays, like the negro *soirées*, to which we have compared them, consisted in the burlesque pictures of provincial manners, provincial oddities, and provincial dialects, which they presented. The Harlequin, the Pulcinello, the Brighella, and the Pantaloon of the modern stage, are lineal descendants of the *dramatis personæ* of the *Atellane fabulæ*. Lady Morgan, in her work on Italy, gives the theory of modern scholars on this point: "The Pulcinello of Italy is not like the Polichinel of Paris, or the Punch of England; but a particular character of low comedy peculiar to Naples as Pantalone is of Venice, and Il Dottore of Bologna. Their name of Maschere comes from their wearing masks on the upper part of their faces. They are the remains of the Greek and Latin theatres, and are devoted to the depicting of national, or rather provincial absurdities and peculiarities." At Cologne, famous for its connection with the Romans, there still exists a puppet theatre, where farces are performed by dolls, and the dialogue spoken in the *patois* of the country, and full of satirical local allusions, is carried on by persons concealed. Being a fashionable entertainment, the *Atellane* were not so coarse as the *Mimes*, which latter were the popular favorites. The Oscan, or Opican language was spread over all the south of Italy; some remains of it have come down to us. Here is a specimen which is taken from an inscription found at Bantia in Lucania, with the Latin interpretation written underneath:—

In sva pls lone fortis meddis moltaum herest.
Et si quis eum fortis magistratus multa violet.

Amperit mistrels altels eltas moltas moltaum hietud.
Una cum magistris altis arari multa multore hietto.

Herest is supposed to be connected with *χαρῆται*, *meddis* with *μεδων*, *amperit* with *αμπερερι*. The *Atellane* were written in verse, chiefly iambic, with many trisyllabic feet. Lucius Sulla, the dictator, and a Campanian by birth, wrote plays of this sort. The names of some of the *Atellane* of Quintus Novius have come down to us, as "Macchus in Exile," "The Poulterer," "The Vintagers," "The Deaf Man," "The Thrifty Man." Lucius Pomponius, who lived about 90 B. C., wrote *Macchus Miles*, the *Pseudo Agamemnon*, the *Bacco Adoptatus*, the *Æditimus* (Sacristan), &c. The Latin, and sometimes the Greek languages, in the times of the emperors, crept into the *Atellane*, particularly in one part called the *Centicum*.

A TEMPO (Ital. in time), a musical term, signifying the return to the original movement, after it has been interrupted by a recitative, or by some other change of time.—A TEMPO CIUSTRO (Ital. in equal time), designates a steady, scientific movement, in opposition to one of an impassioned character.

ATFIEH, a province of middle Egypt, extending nearly one hundred miles along the eastern bank of the Nile. Its capital, of the same name, is situated near the site of the ancient Aphroditopolis, or city of Venus, 42 miles S. S. E. from Cairo. It is the only place worthy to be called a town in the whole province. Population about 4,000.

ATH, or *ÆTH*, a strongly fortified city of the province of Hainaut, in Belgium, on the river Dender, in long. 8° 46' E., lat. 50° 42' N., population, in 1850, 8,437. It has a handsome town-hall, an arsenal with seven bomb-proof magazines, a college, orphan asylum, &c. It has manufactures of linen, woollen, and cotton fabrics, of hats and gloves, bleaching and dyeing establishments, breweries, &c. It is the seat of a considerable trade.

ATHA BEN HAKIM, a Moslem impostor who lived in the 8th century, was born at Meron, and was by trade a fuller. He was also called "Mocanna" or the "Veiled One," from his wearing an impenetrable mask, according to his own account, to cover his face from the sight of man, who could not behold it and live; it is, however, believed that it was to hide from his followers the fact of his having lost an eye, which, were it known, would materially lessen his influence. Atha pretended to be the embodiment of the living spirit of God, which, after transmigration through many forms, human and divine, now, he affirmed, sojourned in his breast in all its original power. His knowledge of philosophy and chemistry was such, that he was enabled to perform wonders which deluded many into the belief that he possessed supernatural powers. Having succeeded in collecting a large band of followers, Atha retired to the castle of Kech, in Transoxane, where he intrenched himself. He was here besieged by a considerable band of soldiers, sent by the caliph Mehedy, under command of Abu Sauid; finding himself in danger of losing his liberty, he preferred to put an end

to his life. He therefore, according to some, applied the torch to his castle and threw himself into the flames, followed by many of his disciples. Others state that he destroyed himself and all who were with him by poison; and again others that he prepared a cauldron of corrosive acid, into which he precipitated himself, in the hope that his complete destruction would follow, causing the belief that he had been removed by divine agency. It is said that his design was frustrated by a lock of his hair escaping destruction. Mocanna is the hero of Moore's poem, "The Veiled Prophet of Khorassan."

ATHA MELIK, ALA-ED-DEEN, surnamed AL-JOWAINI, a Persian historian and statesman, born about 1227, in the district of Jowain, near the city of Nishapoor, died at Bagdad, about 1282. He enjoyed the favor of the Mogul princes of Persia, and was for many years governor of Bagdad. It is, however, only as a writer that he deserves especial notice. His principal work is on the history of the Moguls, and is entitled *Jehan Kuchak*. It has been highly valued by oriental historians, and was by Abulfaragius, Mircond, and others, considered the chief authority on the subject of which it treats.

ATHABASCOA, or ATHAPESCOW, a lake and river of British North America. The former is 230 miles in length from east to west, and with an average breadth of 20 miles, lat. 59° N. long. from 106° to 112° W. The Athabasca river rises in the Rocky mountains and flows into the lake at its south-western extremity. The lake discharges northward by Slave river, and it communicates through Slave lake and Mackenzie river with the Polar sea, and through Wollaston and Deer lakes and Churchill river with Hudson's bay.

ATHALIAH, the daughter of Ahab, that "wicked king" of Israel. She was sought by Jehoshaphat, king of Judah, through motives of policy, in marriage for his son Jehoram, heir of the Judæan sceptre. This marriage appears to have been the occasion of the introduction of idolatry into Judah, and of an interruption in the dynasty of the Judæan kings. Jehoram walked in the ways of Ahab. At his death, Ahaziah, his son, reigned one year, during which time a confederacy had been formed between Judah and Israel against Syria. The conspiracy of Jehu, a captain of the Israelitish army, who had been posted at Ramoth-Gilead, resulted in placing him upon the throne of Israel, and destroying Ahaziah, the king of Judah, with 42 of the princes of the tribe. Athaliah, seeing the advantage that lay before her, caused the rest of the royal line, as she supposed, to be slain, and mounted the throne of Judah herself. But after a reign of six years, it turns out that in the massacre the priests had seized an infant of the royal house, Joash, and had secretly brought him up in the temple. In the seventh year the high-priest brought forth this child, caused him to be anointed as king, and ordered the arrest and condign punishment of Athaliah

by the armed Levites, and thus ended the interpolation of Israel in the Judæan line. The discovery of Joash is the subject of a tragedy by Racine, written at the request of M^{me} de Maintenon.

ATHAMAS, a son of Æolus, married Nephele by order of Juno; but he was secretly in love with Ino, the daughter of Cadmus, by whom he had two sons, Learchus and Melicertes. Nephele, on discovering that Ino occupied a higher place in the affections of Athamas than herself, immediately vanished from the earth. Disasters innumerable now descended on Athamas and his offspring. Ino hating Phrixus and Helle, his children by Nephele, endeavored to destroy them, by first causing a famine, and then bribing the messengers who had been sent to consult the oracle about it, to declare that, if they would avert the calamity, they must sacrifice the sons of her rival. Nephele, however, rescued Phrixus and Helle from the fate which impended over them, and transported them to Colchis, on the back of the ram with the golden fleece. Juno next came forward to punish the infidelity of Athamas, and afflicted him with madness. While in this condition, he killed Learchus, one of Ino's sons, and his mother, in despair, cast herself into the sea with her other son, Melicertes. As the murderer of his son, Athamas had to flee from Boeotia, and having consulted an oracle as to where he should settle, he was commanded to remain wherever he should be hospitably received by savage beasts. He travelled long in search of such a land and such entertainers, but arriving at length to a place where wolves were devouring sheep, they fled away at his approach, and left their slaughtered prey at his disposal. Athamas at once perceiving that this was the country marked out for him by the oracle, settled there, and called his new territory Athamania, after himself.

ATHANAGILD, 14th king of the Visigoths in Spain, succeeded Agila in 554, and died 566. Being threatened by Agila, he applied for aid to Justinian, emperor of the East, to whom he offered several cities in Spain. Justinian sent the troops, and Athanagild defeated his adversary, who was obliged to retire to Merida. Athanagild was reestablished at Toledo which he made his capital.

ATHANARIO, king of the Visigoths in Thrace about the middle of the 4th century, died at Constantinople, Jan. 25, 381. The emperor Valens made war upon him and compelled him to sue for peace. Athanaric would not come upon the Roman territory to sign the treaty, while Valens thought it beneath his dignity to visit the barbarian at home. Accordingly a bridge of boats was constructed across the Danube, and the two potentates met in the middle. In 380 he was compelled to flee to Constantinople, in consequence of an insurrection. Theodosius received him hospitably, and gave him a small pension until his death.

ATHANASIAN CREED, a symbol chiefly composed of precise theological definitions of

the doctrines of the Trinity and Incarnation. The first notices of it are from the 7th century, and do not mention the author. It made its appearance first in France, in the Latin language, became generally known throughout the West, and was adopted last of all in the East. The Greek writers immediately succeeding St. Athanasius make no mention of it. In the MS. editions of his works it is usually not found at all, or, if it is, with the remark "commonly" or "incorrectly" ascribed to St. Athanasius. Although not at first ascribed to him by any writer, it was subsequently attributed to him by all ecclesiastical writers. Durandus (1287) states that it was composed by St. Athanasius, at Treves, during his exile in the West, and Mayer, a modern German critic, thinks this account not improbable. Modern critics generally suppose that it was drawn up by some able theologian, as a summary of the doctrine of St. Athanasius, from which circumstance it obtained the name of Athanasian creed, and in process of time was attributed to the great Alexandrian doctor. It has been attributed, on conjectural grounds, to Hilarius and Venantius Fortunatus, French bishops, to Vincent of Lerins, and to Virgilius, bishop of Tapsus, in Africa (484). This creed is an authoritative formulary of faith in the Catholic and Greek churches. Its authority does not rest on the presumption that it was composed by St. Athanasius, but on its general acceptance as a correct enunciation of Catholic faith. In the Roman Catholic church it is recited at the office of Prime on Sundays, when the office is Dominical. In the church of England it is accepted as of equal authority with the Apostles' and Nicene creeds, and ordered to be recited on certain festivals at the morning prayer. In the 39 articles of the Protestant Episcopal church of the United States all mention of it is omitted, and the creed itself has no place in the prayer-book.

ATHANASIUS, SAINT, patriarch of Alexandria and doctor of the eastern church. He was born at Alexandria about the year 296, of Christian parents, educated under the direction of the learned Alexander, afterward bishop of the city, not only in the elegant branches of secular learning, but more thoroughly in the studies which were preliminary to the Christian ministry, particularly the interpretation of Scripture and the canon law. His preparation was completed by a sojourn of some months or years in the desert of Egypt, where he had the privilege of serving as attendant upon the famous St. Anthony, and could learn by experience the nature and effect of monastic austerities. At the age of 28 he received deacon's orders, and, in the discharge of his office, so signalized himself as a foe to every kind of heresy, that he was chosen by the bishop Alexander to accompany him to the council at Nice (A. D. 325), where the doctrines of Arius were to be dealt with. To the perseverance, subtlety, learning, and eloquence of Athanasius in that council, his adroitness in the management of men and in the statement of ar-

guments, is principally to be attributed the momentous result, which declared by a majority of voices that Arianism was heresy. His bearing on this great occasion, not less than the dying request of the bishop Alexander, secured his election as bishop to the principal see of Africa. The bishops merely came together to ratify a fixed and inviolable popular choice, which imperial opposition could not prevent. Athanasius assumed the episcopal chair about the middle of the year 326, and retained the right and the title until the year 378—more than 46 years. But his long episcopal life was far from being peaceful. It was broken by very numerous misfortunes and disasters. His uncompromising orthodoxy subjected him to the most bitter hatred and the most savage persecution. The party of Arius, which he never ceased to denounce, vowed the ruin of the man who had disgraced and silenced their leader. A series of heretical emperors drove into repeated banishment the intrepid prelate, who was as much an enemy to error on the throne as error in the church. Accusations of many kinds, some of them true, but more of them false, were multiplied against him. He was charged with tyranny, with sacrilege, with the rape of a virgin and the murder of a bishop, with the practice of magic arts, with fraud upon the revenues, with the most mean and cruel avarice; while proofs were offered of his bold defiance of the civil power, and of his zealous intolerance. Even the Roman bishop on one occasion turned against him and subscribed his condemnation. Two years at one time were passed in exile at Treves. Six years long, at another time, was he absent from his flock. The Pagan Julian, from whose tolerance he hoped to find protection, would not tolerate the "wretch" who had dared to baptize Greek women of noble birth; and Athanasius escaped only by stratagem from the emissaries which this monarch sent to murder him. In the reign of Valens the aged bishop was driven for the fifth time from Alexandria, and hid himself for 4 months in his father's tomb. At the age of 76 he was at last allowed to close in peace his troubled career. His festival is kept in both the Greek and Latin churches on May 2, and in the Greek church also on Jan. 18. The life of Athanasius has historical importance mainly from its connection with the Arian controversy, and the establishment and defence of the Nicene creed. With the exception of his "Discourse against the Pagans" and his treatise on "The Incarnation," the works of his novitiate, all the writings of the Alexandrine patriarch have a direct bearing upon the great question in dispute. Some of them discuss the theory of Arius and refute his reasonings; some inveigh against the artifices and violence of his party. The doctrine of the identity of Christ with God is contrasted with the doctrine of a derived Sonship, as well in visible fruits as in rational and scriptural soundness. In one treatise Athanasius gives a graphic history of Arianism, judged from the orthodox stand-point. In another he

pleads with his bishops not to be led captive by the specious persuasions of the foes of the faith. Here it is a learned criticism upon the words of Jesus in the gospel of John; there it is an apology for his flight in persecution. And whether he instructs the churches whom to receive, or advises the monks concerning their duty, or consoles the suffering in time of their trial, or defends himself against the slanders of foes, or explains the word of the Holy Writ, his highest and his absorbing thought and purpose are fixed upon this central doctrine that Christ is God, and that the Son and the Father are equal in honor, in eternity, and in essence. The style of Athanasius, if less florid than those of the other great fathers of the eastern church, has the merits of strength, clearness, conciseness of expression, and exact logical order. It is praised even by Erasmus, the most fastidious of critics, above the style of Chrysostom and Gregory, those masters of sacred eloquence. What it lacks of finished grace it makes up in nervous vigor. There are fewer digressions than in most of the early controversial writings, and fewer flights of fancy than a successor of Clement and Origen might naturally indulge. The character of the man may be discovered in his works. Bold, unbending, confident even to dogmatism, severe against what he believed to be heresy, suspicious of the promises and professions of all who were not friends of the truth, he was yet courteous in his address, mild in his general intercourse, kind to the poor, sincerely pious, just in his decisions, inspiring reverence for his character even in those who dreaded his authority. His patience was never wearied. His confidence in the triumph of truth never forsook him. He is first, if not greatest, in the list of those whom the church counts as her noblest champions; and the defeat of Arianism would be his lasting monument without that later creed, which, expounding the doctrine which he defended, improperly bears his name. The story of his controversies and sufferings is graphically told in the narratives of the historians, Socrates, Sozomen, and Theodoret. The best edition of his works is the Paris edition of 1627-38, 8 vols. folio.

ATHEISM (Gr. *a* privative, and *theos*, God, without God), the denial of belief in God, the Supreme Being. Atheism may be either practical or speculative. Practical atheists are those who live as if there were no God; speculative atheists are those who deny that God exists, and undertake to explain the phenomena of the universe without admitting the idea of God. The fact of speculative atheism has been questioned by many grave philosophers. God, they contend, is the first principle not only in being, but in science, the immediate light and object of reason or the intellect, and affirmed in every act of intelligence. In other words, God by his immediate presence creates and constitutes the faculty of reason, and is its primary and immediate object, so that he affirms, as the intelligible object and light of reason, his own

existence in every one of our thoughts or intellectual acts. According to this view, God, as the intelligible, is intuitively evident, and it is impossible for any one to think without in reality thinking God. But as no one can deny God without thinking, it is therefore impossible to deny his existence. The very act of denial, if analyzed, would be found to contain the affirmation of his existence. According to this doctrine, real speculative atheism is an impossibility.—But, if God is affirmed as the ideal element in every thought, and it is impossible to think without thinking that which is God, it is conceded that he is so thought or affirmed only as the intelligible, and not distinctly and reflectively, or with reflex consciousness, as God. He is really thought, he enters into every thought as its ideal or objective element, without which no thought is possible. But it is not intuitively evident to reason, that this ideal element of thought is God; this is made manifest only by reflection, or reflective reasoning. In reflecting on the intuitive data, and attempting to render an account to oneself of the ideal and objective element of thought, it is very possible to misapprehend it, and to misinterpret and to misapply it. It is even not difficult to mistake its real character, and to fail to perceive the fact that it really is God affirming himself as the immediate light and object of our intellect. Hence, though it is impossible to think and not to think God, it is possible for men to overlook the fact, that what they think in the ideal element of thought is God, and therefore to regard themselves as atheists. In this sense there may be, and have been in all historical ages, speculative atheists, at some epochs in large numbers.—Yet as the ideal element of thought is an inseparable and indestructible element; and as that element really is the affirmation of his own existence by God himself, speculative atheism is necessarily misapprehension, or misrepresentation of that element, rather than its absolute denial. It lies not in the denial of the ideal or necessary element of thought, for that no man can do; but in confounding it with something else, or in identifying it with secondary causes, created objects, or forces. In the history of speculative atheism we find this has been done in 3 different ways, giving us 4 distinct classes of speculative atheists: I. Material atheists. These substitute for God the material forces of nature, or identify with them the being or reality affirmed in the ideal element of thought. They cannot free themselves from the conception of the ideal, of being, power, cause, necessity, &c., but instead of integrating them in a supreme, eternal, imputable, and necessary being, origin, and end of all, they identify them with the material forces of the universe, and ascribe to these forces most of the functions which theists ascribe to God. In this class may be placed the Greek philosophers of the Ionian school, Lucretius, Hobbes, the French atheists of the last century, Comte, and several modern

Germans, not represented by any school. II. Ideal atheists. These substitute for God the laws and principles of the universe. They suppose the universe operates by virtue of certain universal laws or principles inherent in it, and indistinguishable from it, constituting it a sort of self-existing and self-developing organism, in which they approach the old philosophers, who held God to be the soul of the world—*anima mundi*. In this class we may include Giordano Bruno, Vanini, Schelling, and, as to their tendencies, large numbers of distinguished modern naturalists. They admit an intelligible or super-sensible universe, which they regard as the real universe, and thus look upon the sensible universe, not as real, but as simply phenomenal. Schelling seems in his later statements to have approached theism, and perhaps some others in the list were not personally unbelievers in God, but they belong nevertheless to the class of ideal atheists, inasmuch as in their systems they attempt to explain the existence, the facts, and the phenomena of the universe, without the creative act or intervention of a supra-mundane God, or any power distinguishable from the universe itself. III. Egoistical atheists. These confound the ideal or necessary element of thought, which is objective, that which affirms itself to us in the fact of thought, with the subjective element, or consciousness; or, in their own language, assert the absolute identity of subject and object in thought. To this class belong Fichte, in his earlier teachings, Hegel, as explained by a portion of his disciples, and in germ even Immanuel Kant himself. These start with the assumption that thought begins and ends with the subject thinking, and demands no really objective existence as its necessary condition. In other words, the subject does not need, in order to think, an object distinct from itself; and in the fact of thought there is no object affirming itself, but simply the subject producing or projecting its object from itself. The subject suffices for itself, is independent, absolute, and creates its own world. The universe, with all its principles, laws, phenomena, truth, beauty, goodness, are all projected from the subject, the ego, and depend on it, and are voluntarily or involuntarily determined by its laws,—are, in fact, only the phenomena, modes, affections, or productions of the thinking subject. They confound, therefore, the ideal with the subjective, the necessary with the contingent, being with existence, and assert the absolute identity of the object with the subject. IV. Eclectic atheists. These attempt to explain the phenomena of life and the universe, not by any one of the methods mentioned, taken as an exclusive method, but by a combination of two or all of them.—Atheism, whatever its method, accepts in some form the ideal element of thought, and ascribes to the material forces of nature, to universal laws and principles, to absolute egoism, or their combination, the causality, the independent being, the adaptation of

means to ends, the arrangement of one thing in relation to the other, and the production of harmonies, which theism ascribes to the Supreme Being, or supra-mundane God. It does not deny the ideal element of thought, or the fundamental conceptions which enter into the belief in God, of which it would seem the human mind cannot divest itself, but applies them to the universe itself, mistaking, in the view of the theist, second causes for the primary, and derivative or created being for the primitive. Speculative atheism may be briefly defined as the denial of the Supreme Being as first cause, and practical atheism as the denial of God as the last or final cause; consequently the denial, as theists allege, of the moral law, moral obligation, or duty; for if there is no end for which—*finis propter quem*—man exists, there is and can be for him no moral law, no duty; and, if God is not that end, then he can be under no moral obligation to obey God, or to submit to his will, or his law.

ATHELING (Sax. *athel* and *ling*, a noble youth), a title borne by several members of the royal house in the Saxon period of English history. It was long regarded as a surname, and was first proved by the researches of Selden to be only a title of honor. Thus Selden remarked that the earlier Latin chroniclers wrote the name of Edgar Atheling as Edgarus Clyto, the last being a word of Greek origin, signifying the renowned or illustrious. The title was not limited to the heir-presumptive to the throne, and at first belonged probably to all who were of the blood of Odin, the ancestor of all Saxon sovereigns. See EDGAR ATHELING.

ATHELNEY, ISLE OF, a tract of about 100 acres of land, in the county of Somerset, in England, 7 miles S. E. of Bridgewater. In the time of Alfred the Great, it was an island at the junction of the Tone and Parret rivers. Alfred concealed himself among its marshes during the Danish invasion, and afterward founded an abbey there, about 888.

ATHELSTAN, king of England, from 925 to 940, and was the first who called himself king of the English; Edward the Elder, his father, and Alfred his grandfather, having called themselves kings of the West Saxons, or Anglo-Saxons, while Egbert and the kings between him and Alfred never assumed a larger title than kings of the West Saxons. Athelstan was the illegitimate son of Edward the Elder, but as the only legitimate son of Edward who was of age died a few days after the death of his father, Athelstan, according to the customs of descent which prevailed among the Saxons, was preferred by the Witenagemote to his legitimate brothers who were under age, and he was crowned king of the Anglo-Saxons at Kingston, on the Thames. He did not, at his accession, hold sway over the whole even of modern England proper. Cornwall and half of Devonshire were under the West Welsh princes, as in the north was the independent kingdom of Northumbria. He annexed the territory of Cornwall

and Devon, and exacted tribute from Howel Dha, the Pendragon of Wales. When Sigtric, king of Northumbria, died, Athelstan seized upon his territory also. The Irish, the Scots, and the Welsh, saw with terror or dislike the increase of the power of the South Saxon king. As the kingdom of Northumbria had been chiefly settled by Danes, and as Anlaff was of Danish descent, the Danes and Norwegians sent Anlaff a force to expel Athelstan from Northumbria. Anlaff adroitly allied himself with the Irish, the Scots, and the Welsh. The allied army met the English forces under Athelstan, at Brunenburg, in Northumbria, and was signally defeated. In Saxon poetry and history, this victory was called the Great Battle. After this event, Athelstan enjoyed great consideration on the continent of Europe. His sisters were given in marriage to the king of France, the emperor of Germany, and a Norse king. He died in his 47th year, and was buried in the Abbey of Malmesbury, leaving no family, and was succeeded by his brother, Edmund. England advanced in civilization under Athelstan; he added much to the code left by Alfred. One of his decrees was, that any merchant who made 3 voyages on his own account beyond the British Channel, or narrow seas, should be entitled to the privileges of a thane, or gentleman. He favored learning, built monasteries, collected books, and encouraged the translation of the Scriptures into the vernacular. Two of his books are believed to be extant among the Cottonian manuscripts in the British museum.

ATHENA, or PALLAS ATHENE, in Greek mythology, one of the principal of the Olympian divinities. It appears from the various forms of the myth, that she was one of the most ancient religious conceptions of the Greeks. The fable of her birth is thus related: Zeus, after a victory over the Titans, chose for his first spouse the goddess, Metis; but an oracle having declared that the son of Metis would snatch the supremacy away from his father, Zeus in alarm swallowed both Metis and her unborn child. When the time of birth arrived, Zeus felt a violent pain in his head, and in his agony requested Hephestus to cleave the head open with an axe; whereupon Athena sprang forth, according to the later accounts, in full armor, and with a mighty war shout. She first took part in the discussions of the gods, as an opponent of the savage Ares. She gave counsel to her father against the giants, and herself slew Pallas and Enceladus, the latter of whom she buried beneath the island of Sicily. She was the patron of heroism among men, and armed with her ægis, aided her loved Greeks in the Trojan war. As a protectress of the arts of peace, she appears as a maiden, in many respects resembling a princely daughter of the early heroic period. She bears in her hand the spool, the spindle, and the needle, and is said to have invented and excelled in every kind of work proper to women. She also extended her active and original genius over the employ-

ments of men, and the agriculturist and the mechanic were under her care, and the philosopher, as also the orator and poet, delighted in her protection. In all these employments she is the symbol of thought, the goddess of wisdom; and as such she was worshipped throughout Greece, and under the name of Minerva, she was inherited by the Romans. She was especially the national divinity of the Athenians, having in the reign of Cecrops contended with Poseidon for the land, which she planted with the olive. On the Acropolis of Athens stood the magnificent temple of the Parthenon, dedicated to her, and containing her statue by the hand of Phidias: and the sacred festival of the Panathenæa, was celebrated with great splendor in her honor. In the representations of art, as in the events of her life, she remains the goddess of pure reason, raised above every feminine weakness, and disdaining love. The helmet, buckler, lance, and ægis, were her attributes; and the olive-branch, serpent, and owl, were sacred to her. She was in the ancient traditions represented as clothed, usually in a sleeveless tunic, over which she threw a cloak, or folding peplos.

ATHENÆUM. I. A place, whether town or temple, sacred to the Greek goddess, Athena. II. A particular gymnasium at Athens, dedicated to Athena, where poets and orators used to assemble, recite their pieces, and instruct youth. III. A high school or university, founded by the emperor Hadrian, at Rome, about 140 B. C., for the promotion of literary and scientific studies. Under Theodosius II., there were 3 salaried orators, 10 grammarians, 5 sophists, 1 philosopher, and 2 lawyers, employed in it as teachers; poets, pedagogues, orators, and critics, were also wont to come there to recite their productions, on which occasions the emperors were often present. This establishment became the model for a number of provincial schools scattered over the western empire, of which the best known are those of Lyons and Nismes. IV. In modern times, the name has been applied to voluntary associations of persons of literary or scientific tastes, for the purpose of mutual improvement.

ATHENÆUS, a distinguished Greek writer, who lived in the 3d century of the Christian era, was a native of Egypt. He is chiefly known to us as the author of the *Deipnosophista*, a voluminous work of imaginary table talk, on almost every conceivable subject, especially gastronomy, between certain learned men while enjoying themselves, as it were, at supper in the house of an imaginary Roman named Laurentius, with Galen the physician, and Ulpian the jurist, among the guests. It consisted of 15 books, but only the 1st and 2d, and part of the 8d, 11th, and 15th, are now extant in an epitome, of which we know neither the date nor the author. Notwithstanding its many literary and artistic defects, the great mass of information which it contains, and the light which it throws on the manners of the ancients, will

ever cause the *Deipnosophists* to be prized by the scholar and the antiquary. The best edition of this work is that of Dindorf, in 8 vols., 8vo, Leipsic, 1827. An English version of it will be found in Bohn's Classical Library, which has at least the merit of being faithful.

ATHENAGORAS, a Grecian philosopher, who became a convert to Christianity, and flourished probably in the reign of Marcus Aurelius, and his successor. It is said that he was a native of Athens, and first master of the catechetical school at Alexandria. His conversion was brought about as follows. Intending to write against the Christians, he applied himself to the study of the Holy Scriptures, but soon becoming convinced of their truth, he abjured Paganism, and embraced the religion which he had purposed to assail. He afterward addressed an apology to one of the emperors in behalf of the Christians, in which he refuted the charges of atheism, profligacy, and cannibalism, that had been advanced against them. He also wrote a treatise in defence of the doctrine of the resurrection, in which he proves that the presumptive arguments against it are inconclusive. These works of Athenagoras are still extant. Their style is Attic and elegant. The best edition is that of the Benedictines, Paris, 1742.

ATHENAS, PIERRE LOUIS, a French agriculturist, born at Paris, February 8, 1752, died March 11, 1829. He was a pupil of Buffon and Daubenton. In 1786 he settled at Nantes, where he remained until his death. He revolutionized the agriculture of the department Loire Inférieure, naturalized there the Guinea grass, invented a plough which brought him the gold medal of the academy of sciences, besides other services to rural economy.

ATHENION, a native of Cilicia, one of the chiefs in the servile war of Sicily under Salvius. He affirmed that the gods had commissioned him to deliver Sicily. Salvius, becoming jealous of him, threw him into prison, but he was released previous to the indecisive battle with Lucullus. He was finally defeated and killed by the Roman consul, M. Aquilius, 101 B. C.

ATHENS. In the history of civilization, Athens stands preëminent in the variety, and splendor, and permanency of her contributions to the progress of humanity. The great names that adorn her history, whether native or adopted, surpass in number and brilliancy those which have graced the annals of any other city. In statesmanship and war, in arts and eloquence, in practical skill and chastened taste, Athens still stands unrivalled among the cities of the European world.—Athens was anciently the principal city of Attica, and is now the capital of the kingdom of Hellas. It is situated in lat. 37° 56' N. long. 23° 38' E., in the plain of Attica, about 4 miles from the east coast of the Saronic gulf, and 4½ miles from the port town of Piræus. It was built round a central rocky height, called the Acropolis. This is an elevation about 800 feet above the average level of the town, and 600 feet

above the level of the Mediterranean. Grouped near it are several smaller elevations, with valleys between. North-west of the Acropolis is a moderate height on which stands the temple of Theseus. At a short distance from the north-west angle, is the Areopagus; and over against the Areopagus is the hill of the Pnyx, with the hill of the Nymphs a little north, and the museum, or hill of the Muses, at a short distance to the south. North-east of the city rises the conical hill of Lycabettus, forming a remarkable object in the landscape. The plain itself, in which the city stands, is bounded on the N. by Mt. Parnes, which separates it from Boeotia, on the N. E. by Mt. Pentelicus, on the S. E. by Mt. Hymettus, which descends to the sea, on the S. W. and W. by the Saronic gulf, and on the N. W. by Mt. Ægaleos.—No doubt a stronghold on the rock, afterward called the Acropolis, was the germ of the city of Athens. Many ancient cities, not only in Greece, but in other parts of the eastern world, may be traced to a similar origin. They are built at some distance from the shore, that they may be out of the reach of pirates; and on or around a rocky height, that the inhabitants may have a place of refuge against the attacks of marauders by land. The Acropolis of Athens, and the Acropolis of Corinth, are among the most remarkable specimens of this manner of city building.—Probably the first settlement was made by some chieftain who fortified himself on the summit, and whose followers, with an agricultural population, occupied the grounds adjacent to the foot of the hill. By degrees, a community was formed, not unlike the baronial establishments of the middle ages. But all the details of the origin and growth of Athens are lost in the darkness of an unfathomable antiquity. Numerous legends, however, having a basis in historical truth, gathered in the course of ages around the Acropolis, and were embodied in the poetical literature, and in the works of art, the renown of which has filled the world.—According to these legends, Cecrops, sometimes represented as an Egyptian settler, sometimes as an autochthonous Pelasgian hero, first took possession of the rock, which from him was called Cecropia. He was succeeded by a line of 16 kings, bearing the names of Oranaus, Amphictyon, Erichthonius, Pandion, Erechtheus, Cecrops II., Pandion II., Ægeus, Theseus, Menestheus, Demophon, Oxyntes, Aphidas, Thymetes, Melanthus, and Codrus. In the reign of the second or third king, the city is said to have received its name from the protecting goddess Athena—the name which it has never ceased to bear to the present day. Erechtheus is said to have built a temple to Athena on the Acropolis, where he placed the statue of the goddess, made of olive-wood—the ancient Athena Polias—and where he was himself buried. Homer speaks of the house of Erechtheus and the temple of Athena (Il. ii. 546). The temple was called, from this legend, the Erechtheum; and the name is perpetuated in the Erechtheum of Pericles, the ruins of

which form a conspicuous object on the Acropolis. Theseus is, however, the favorite among the legendary kings of Athens. He is said to have united the 12 communities, or cities, into which Attica was hitherto divided, into one political body, and to have laid the foundation of those institutions which, remodelled by the legislation of Solon, and made still more popular by the democratic tendencies of subsequent legislation, existed, with occasional interruptions, through the entire historical existence of ancient Athens. The memory of Theseus was perpetuated in after ages by the beautiful temple which bears the name of Theseum, and which still stands, in better preservation than any other building of the ancient city. Menestheus led the 50 dark ships of the Athenians in the Trojan war, and is pronounced by Homer the first of warriors, except Nestor. The 17th and last king of Athens was Codrus, who sacrificed himself for his country in a war with the Peloponnesian invaders, who, according to an oracle, were to be victorious if they did not slay the king of the Athenians. After him, no one, so the legend says, was permitted to bear the title of king. His son, Medon, succeeded him under the name of archon, or ruler, holding the office, however, upon the hereditary principle, and for life. A line of life archons continued to rule through 12 reigns, Alcmaeon being the last. During the government of his predecessor, Æschylus, supposed by some to be the ancestor of the poet Æschylus, commenced the era of the Olympic games, celebrated at intervals of 4 years, at Olympia in Elis, and affording a convenient period for the computation of chronology. This date—the earliest fixed point in Greek chronology—has been satisfactorily established at 776 B. C.—After Alcmaeon, the time of the archonship was changed to the term of 10 years, and a series of 7 decennial archons carried on the government until 688 B. C., when a further change was made, and the office was made annual, its various functions distributed among 9 colleagues, and the right of election extended to the entire class of the eupatridæ, or nobles. One of these—the head of the college—bore the title of *the archon*, and was designated as the eponymus—a magistrate in whose name the transactions of the year were dated, and recorded. The office of archon lasted until long after the independent political existence of Athens and Greece had come to an end, and was sometimes held by distinguished Romans, on whom the rights of Athenian citizenship had been conferred.—There is no complete list of the annual archons preserved. Between 684 B. C. and 292 B. C.,—that is, from Creon, the first annual archon, to Philippus, the last recorded name, there should be 392 eponymic names; out of these, however, only about 236 are known. Between 485 B. C. and 294 B. C., the list is unbroken.—The only important political body existing at Athens, at the time of the first appointment of life archons, was the senate or council of Areopagus, which appears to have

been, in its earliest constitution, the representation of the Homeric *Boule*, and until the time of Solon, was called simply the Boule, or senate. In the course of time, the oppressions and abuses of the eupatridæ gave rise to popular discontents, and Draco was appointed, 624 B. C., to draw up a code of written laws. He made no change in the political forms; but merely attempted to introduce a code of laws, the unwise severity of which made it impossible to execute them. Twelve years after Draco's legislation, Cylon, a distinguished and ambitious member of the eupatrid order, attempted to usurp the supreme power of the state, and occupied the Acropolis with a strong body of his partisans; but the conspiracy failed. Cylon escaped, and his partisans, who had taken refuge, some at the altar of Athena, others at the altar of the Eumenides, were put to death by the direction of Megacles, the representative of the house of the Alcmaeonidæ. This act was supposed to have brought upon that illustrious race the curse of the gods, and they were expelled from the city in 597 B. C. Epimenides, the Cretan sage, was invited to purify the city from the pollution of sacrilege by expiatory rites. His visit is placed in 596 B. C.—The glory of Athens as a political commonwealth dates from the age of Solon, who was born about 638 B. C., of the most illustrious descent in Athens, since Codrus, the patriot king, was his ancestor. The virtues of his character, and his intellectual endowments and high culture, corresponded to the greatness of his birth. In 600 B. C., he reconquered Salamis by driving the Megarians out of the island. Afterward, being sent to the Amphietyonic council, he maintained the cause of the Delphian oracle against the Amphiesians of Cirra. At Athens, the citizens were divided into violent parties, and the lower classes were reduced to the most abject poverty. Many of them were reduced to slavery, or sold to pay their patrician creditors, and there was imminent danger of insurrection and civil war. Solon was chosen archon in 594 B. C., with unlimited powers to make any changes in the constitution of the state which might appear to him necessary for the public good. He devoted himself to this august task with all the force and sagacity of his vast intellect, and with a disinterested devotion to the highest good of his country, rarely equalled in the history of man. His political labors have exercised a wider and a deeper influence upon the governments of the most civilized nations, than those of any other legislator. His first act was a measure of relief for the oppressed classes, somewhat of the nature of a modern bankrupt law. He then proceeded to frame a constitution, establishing and defining the limits, conditions, and rights of citizenship, and the legislative, judicial, and executive bodies in the state. Heretofore, the principle of birth constituted the title to political power; he changed it from birth to property; from an oligarchical, to a timocratical system. This was a long step

toward the establishment of a democratic constitution, and was so generally acknowledged by Athenian statesmen of subsequent ages, that they habitually spoke of Solon as the founder of the democracy. He divided the citizens into 4 classes, according to property: 1. The *Pentecosiomedimni*, or those whose annual revenue was equal to 500 medimni of corn and upward. 2. The *Hippeis*, or knights, whose income ranged between 300 and 500 medimni, and who were sufficiently wealthy to furnish a war-horse. 3. The *Zeugitai*, whose income ranged between 200 and 300 medimni, and who were able to keep a yoke of oxen. 4. The *Thetes*, whose incomes fell short of 200 medimni. This 4th class were exempt from taxation, and excluded from public office, but they served as light troops in the army. Only the first class were eligible to the higher offices of the state; the 2d and 3d classes filled the inferior offices; the 2d class served in the army as horsemen, and the 3d as heavy-armed foot soldiers. All classes had the right of voting in the public assembly, which elected the archons and other magistrates. Solon established another legislative body called the senate or council of the Four Hundred, elected by the assembly, 100 being taken from each of the 4 tribes, into which the people were divided long before Solon. The court of the Areopagus was endowed by Solon with enlarged powers, and with the general supervision of the conduct and lives of the citizens, and the institutions of the state.—These were the principal institutions of the great lawgiver. His laws were inscribed on wooden rollers and tablets, and preserved first in the Acropolis, and afterward in the Prytaneum. We have only a few fragments of the original enactments; but it is probable that the leading principles of the code were embodied in the subsequent legislation of the Boule and the Ecclesia. Having completed his legislative labors, Solon bound his countrymen to abide by his enactments for 10 years, and left his country immediately for foreign travel. During his absence, Pisistratus, his kinsman, availed himself of the dissensions which broke out anew, to make himself master of Athens, and on his return, the schemes of the aspiring citizen had been already carried so far, that even Solon's influence was insufficient to thwart them. Pisistratus seized the Acropolis in 560 B. C. Solon remained unmolested at Athens, and died soon afterward, at the age of 80.—Notwithstanding the irregular and unconstitutional means by which Pisistratus acquired power, he made, on the whole, a wise and liberal use of it. He adorned Athens with many public works; he laid the foundations of the great temple of Olympian Zeus, south-east of the Acropolis, the ruins of which to this day excite the wonder of the traveller. He collected a public library, and called around him the most distinguished poets, artists, and scholars, from every part of Greece. He died 527 B. C., having administered the government for about 33 years, with the exception of

10 years passed in exile. His power descended to his 2 sons, Hippias and Hipparchus, who carried on the government in accordance with the same principles as their father. Their government was overthrown by the conspiracy of Harmodius and Aristogiton. Hipparchus was slain 514 B. C., and Hippias, escaping death, became a suspicious tyrant, and at length was compelled to quit Athens, 510 B. C. He sailed to Asia. The memory of the tyrannicides was cherished with extraordinary fondness by the Athenians, as may be seen in the famous drinking song—

In a myrtle bough I'll bear my sword,

and their statues were erected near the ascent of the Acropolis. Clisthenes and Isagoras were now rivals for power, and the constitution of Solon, under the forms of which Pisistratus and his sons had carried on the government, went for a time into full operation. Clisthenes, however, soon found the necessity of introducing some popular changes in the constitution, and of extending the right of sharing in public affairs to a larger number of the citizens. He accordingly reorganized the people by dividing them into 10 tribes, instead of the old Ionic 4 tribes; and these 10 tribes were local, and were subdivided into districts or townships called *demes* (*δημοί*). We find the names of about 174 of these small local divisions. It was customary to designate every citizen by affixing to his name the epithet indicating the *deme* to which he belonged. The senate was also changed, and its powers and duties greatly increased. It now consisted of 500 members, 50 being taken from each tribe. The general control exercised by the people over the affairs of government, through the Ecclesia, was also greatly enlarged. Fixed times were established for the meetings of this body, to discuss and decide their own affairs, and the powers of the archons were reduced in proportion. The judicial powers of the people were ascertained by the establishment of the Heliastic courts, of which 10 were organized, either by Clisthenes, or soon after his time. The new arrangement of the tribes led to a new arrangement of the military service, the administration of which was placed in the hands of 10 generals, one being chosen from each tribe. With them was associated, however, the polemarch, or 3d archon, who under the old constitution held the exclusive military command. The ostracism was also introduced by Clisthenes, which, notwithstanding the vindication of the institution ingeniously attempted by Mr. Grote, remains a monument of popular injustice.—Under these institutions, the city of Athens, as well as the state of which it was the political head, soon began to put forth the signs of a vigorous prosperity, which excited the jealousy of Sparta. The Spartans made several attempts to overthrow the growing democracy. Their first plan was to establish Isagoras, the rival of Clisthenes, as tyrant of Athens; but the expedition

set on foot to accomplish this purpose failed through the dissensions of the 2 Spartan kings and their allies, and the Athenians took advantage of their retreat to conquer the Chalcidians, in Euboea, and to divide the conquered lands among the needy classes of their own citizens. The Spartans now made another attempt by organizing a plan for the restoration of the exiled Hippias;—the commencement of that series of events which resulted in the Persian invasions of Greece. The history of the Greek colonies belongs to another place. We must content ourselves here with 2 or 3 remarks. At an early period, the stream of emigration set eastward, and the fertile region of Asia Minor was occupied by a line of colonial settlements, along the southern and western coasts, including the adjacent islands. The northern line of settlements were those of the Æolian race, the central of the Ionian, and the southernmost, the Dorian. These Greek-Asiatic states soon rose to a high degree of external prosperity and intellectual culture. The art of poetry especially flourished in those happy regions, with great luxuriance, and the poems of Homer, not to mention the Lesbian Sappho, and the Ionic successors of the bard of Chios, stand at the head of European literary culture, and have never been surpassed, if they have ever been equalled, in the department of the art to which they belong. The Greeks of Asia Minor naturally were brought into contact, friendly or hostile, with the Asiatic monarchies in their neighborhood—the Babylonians, Medes, Persians, and especially the Lydians. Under the reign of Croesus, in the first half of the 6th century B. C., the Greeks of Asia Minor were reduced to subjection, and his capital, Sardis, became the centre of wealth and refinement, and the resort of sages and poets from the Hellenic world. The Persian empire owed its rise to power to the genius of Cyrus, who conquered the Medes and the Lydians, and joined the Greek cities of Asia. Cyrus died 529 B. C., leaving his empire to his son Cambyses. His successor was Darius, who ascended the Persian throne 521 B. C. About the year 500 B. C., serious difficulties commenced between the Ionian cities and the Persian monarchy, and the aid of the Greeks at home was invoked. The Athenians showed a ready sympathy with their Ionian kinsmen, and were incensed at the imperious orders of the Persian satrap, Artaphernes, that they should recall Hippias. An Athenian fleet was sent across the Ægean; a sudden march was made upon Sardis, and the city was burned. The Ionian revolt soon after this event reached its height, and Darius made vigorous preparations to suppress it, and to punish the Athenians who had so readily aided the insurgents, and whose name he appears never before to have heard. The fall of Miletus, 495 B. C., was followed speedily by the subjugation of all Ionia. Preparations were now made to punish the Greeks, and especially the Athenians, for the part they had taken in supporting the re-

volt. The first expedition failed miserably, the Persian fleet having been wrecked in attempting to double the promontory of Athos, and the army of Mardonius being defeated with great slaughter by the Brygians in Macedonia, 492 B. C. Darius was not turned from his purpose by this disastrous result. In 490 B. C., he had assembled a vast army and a fleet of 600 galleys. Datis and Artaphernes were placed in command, with orders to subdue all Greece, and especially to burn the cities of Eretria and Athens, and to bring their inhabitants to Persia, as slaves. They made directly across the Ægean for Euboea. Eretria defended herself for 6 days, but on the 7th was betrayed by 2 of the citizens. From Eretria, Datis proceeded, under the guidance of Hippias, who had joined the army, to land on the plain of Marathon, in the expectation of speedily accomplishing the destruction of Athens. Among the 10 generals of this year at Athens, were the illustrious citizens, Miltiades, Themistocles, and Aristides. As soon as the fall of Eretria was known, a messenger, Phidippides, was sent to Sparta to ask for aid, and a military force was marched over to Marathon, about 28 miles distant, on the eastern coast of Attica. The Spartans did not start in season to take part in the battle, being detained at home several days by a superstitious scruple which forbade them to commence a march before the full moon; but the little town of Plataea sent its whole military force, consisting of 1,000 heavy-armed men, being moved thereto by a grateful recollection of the aid extended by Athens in a former period of distress. The generals were divided in opinion as to the expediency of immediately attacking the formidable host of the Persians; but Miltiades, Themistocles, and Aristides warmly urged the attack, and influenced Callimachus, the polemarch, who had the casting vote, to give it in favor of battle. Fortunate for the history of the world, that manly counsels prevailed. We need not dwell upon the incidents of the momentous conflict; they are among the commonplaces of history. The Persians were defeated and driven into the sea. The poet Æschylus was one of the heroes of the day. Those who fell were buried on the spot; a mound was raised over their remains; their names were recorded on 10 columns, one for the dead of each tribe; they were celebrated in song as the champions of Hellas:

At Marathon for Greece the Athenians fought,
And low the gilded Medians' power they brought.

The columns have vanished, but the verses of Simonides remain; and the mound still stands on the plain of Marathon, an object of deathless interest to the traveller. Miltiades was honored with a separate monument, and his figure stood foremost in the picture of the battle with which the *Poikile* was adorned. Thus ended the second attempt of the Persians to subjugate Greece. In the Saronic gulf, about 12 miles west from the coast of Attica, lies the picturesque and hilly island of Ægina. In an-

cient times it was rich, populous, and flourishing, and was a formidable rival to Athens, by reason of its extensive commerce. The inhabitants were of Dorian descent, and this circumstance probably added bitterness to the ancient feud. Ægina was one of the states that submitted to the demands of Persia, by the symbolical act of giving earth and water to his envoys. They were complained of to the Spartans and the Athenians for this desertion. Cleomenes, the Spartan king, was dispatched with orders to arrest the leaders. He was prevented from executing the order by the intrigues of his associate, Demaratus; but, having caused Demaratus to be deposed, he succeeded in a second attempt, and placed 10 of the leading citizens of Ægina as hostages at Athens. After the battle of Marathon, the Æginetans endeavored to recover these hostages, but without success, and hostilities broke out between the two states. Themistocles made this the occasion for urging upon his countrymen the importance of building a fleet, as the only means of coping with their adversary, and with the sagacious view of meeting the Persians on the sea, who were already making large preparations for another invasion of Greece. Two hundred triremes were accordingly built. It was not until 10 years after the battle of Marathon that the Persians completed their preparations. They were made on the most formidable scale. In 480 B. C., Xerxes, with his innumerable hosts, crossed the Hellespont, and commenced his southward march through Thrace, his fleet moving along the coast, in concert with the army. The battle of Thermopylæ was fought, and the pass, after a desperate resistance, forced. A second time the genius of Simonides commemorated, in a few pregnant and immortal verses, the exploits of Hellenic valor; but now it was the Spartans who were the subject of his mighty line:

Stranger, the tidings to the Spartans tell,
That here, obeying their commands, we fell.

The Persian fleet suffered the loss of 400 ships by a terrible hurricane off the coast of Pelion; and, soon afterward, they encountered the Greek fleet near Artemisium, and, though the victory was not clearly decided, suffered severely in the encounter. After the battle, the Greek fleet withdrew through the strait of Eubœa, sailed round the promontory of Sunium, and took up a position on the eastern side of the island of Salamis. The army of Xerxes, mean time, was rapidly marching upon southern Greece, and would reach Attica in a few days. The oracle of Delphi had warned the Athenians to fly to the ends of the earth. A second response intimated that the wooden walls would shelter them when all was lost. The Athenians removed their women and children to Salamis, Ægina, and Trœzen, on the opposite coast of the Saronic gulf, and made vigorous preparations to meet the shock of the Persian fleet. Some, however, took refuge behind the wooden barricade of the Acropolis. The Persian host, on

arriving at Athens, took up their position on the Areopagus, which is separated from the north-west angle of the Acropolis only by a narrow valley, and assailed the wooden ramparts with burning arrows; but this failed to bring the intrepid defenders to terms. At length they gained the summit by climbing the steep rock on the northern side, near the cave of Aglauros; the temples and other buildings on the Acropolis were pillaged and burned, and the defenders slain. The Persian fleet, about the same time, reached the bay of Phalerum. By the influence of Themistocles, the Greek fleet awaited them at Salamis; a great battle was fought, in which the Persians were disastrously routed, 40 ships being lost on the side of the Greeks, and 200 on the part of the Persians. We have a brilliant description of this battle in the "Persians" of Æschylus, who fought here as well as at Marathon. Xerxes immediately began his homeward march, leaving Mardonius to prosecute the war in the following spring. The Athenians returned to the city, and at once commenced rebuilding it. They rejected the tempting offers of the Persian commander, who hoped to detach them from the Hellenic alliance. He again took possession of the city in the summer of 479 B. C. The Spartans, who had been selfish and lukewarm, were now thoroughly roused to their danger, and hurried a large army to the frontiers, and Mardonius retreated into Bœotia. The battle of Platœa, and the death of Mardonius, put an end to all further danger for the present. The bravery and magnanimity of the Athenians during these severe struggles, justly gave them a most commanding position among the Greek states, and laid the foundation of the hegemony, or headship, which they exercised during the interval between the Persian invasion and the Peloponnesian war. Many of the Greek states of Asia Minor and the islands of the Ægean, formed a league for the common defence, and acknowledged the leadership of Athens, by agreeing to pay a contribution of money or ships, she undertaking the duty of protecting them, by her powerful fleet, against the barbarians. This was called the confederacy of Delos; because the contributions were to be deposited there, under the charge of certain officers called Hellenotamæ. The contributions were at first assessed by Aristides, whose reputation for justice commanded the confidence of all. In 470 B. C. the island of Scyros was conquered and colonized by Cimon, and the bones of Theseus carried thence to Athens, by command of an oracle. They were placed, with solemn ceremonies, in the consecrated precincts of the Theseum, a temple erected in honor of the national hero, and to this day one of the most beautiful ornaments of the city. The rebuilding of Athens on a larger scale, and with stronger defences, excited the jealousy of the Æginetans and the Spartans, and attempts were made to interfere. These were frustrated

by the policy of Themistocles. The city was surrounded by massive walls, the fleet was increased, the harbors of Piræus and Munychia were fortified with walls and towers, vast ruins of which remain to this day. The walls of Athens, inclosing the *Asty*, or town proper, included the Museum, the *Pnyx*, the *Areopagus*, the *Acropolis*, extended north-east nearly to the foot of *Lycabettus*, probably crossed the *Ilissus*, enclosed the *Stadium*, recrossed the *Ilissus* at a point south of the *Acropolis*, and then ran west of the hills above mentioned. There is, however, a difference of opinion among antiquaries as to some of the details of the walls, and their extent, but as no trace of them now remains, the only mode of coming to a probable conclusion is by carefully studying the topographical hints of the ancient authors. The line above indicated seems to answer best all the conditions of the problem. Forchhammer, the eminent German, and Col. Leake, the admirable author of the topography of Athens, are the principal modern authorities. Col. Leake gives the walls a less extent, especially on the southern side, but the views of Forchhammer have been generally acquiesced in. Among the ancients, the most exact description of the walls, as they stood at the opening of the Peloponnesian war, is that given by Thucydides (lib. ii. 18). The long walls, connecting the city with Piræus and Phalerum, were commenced in 457 B. C. and completed in the following year, the object being to surround the port, town, and the city with an unbroken series of fortifications. At a later period, an intermediate wall, parallel to the northern or Piræic wall, at the distance of 550 feet, was built, under the direction of Pericles, and the southern, or Phaleric wall, seems to have been suffered to go to ruin. A carriage road from Piræus to Athens was constructed between the long, or parallel walls, and houses were allowed to occupy the spaces at the sides. The length of the wall surrounding the city was about 8 miles, the Piræic and Munychian walls about as much more, and the long walls about 4½. Considerable uncertainty exists as to the number, position, and names of the city gates. The names of 11 have been preserved, and the situation of some of them has been made out with a good degree of probability. The gates mentioned are the *Dipylum*, the *Sacred gate*, the *Piræic gate*, the *Melitan gate*, the *Itonian gate*, the gate of *Diocares*, the *Diomeian gate*, the *Herian gate*, the *Acharnian gate*, the *Equestrian gate*, or the gate of *Ægeus*. The first 4 were on the western side of the city; the *Itonian* on the southern; the gate of *Diocares*, and the *Diomeian*, on the eastern; and the 8 last mentioned in the list on the northern side.—The progress of Athens in letters and arts, in the period of her hegemony, was wonderful; but the most brilliant age of her brilliant career was that of Pericles, who, born of the noblest Athenian lineage, and educated under the ablest masters, came forward as a popular leader in 469 B. C.

He was the most eloquent in public debate; the most accomplished in literary and philosophical acquirements; the most far-seeing and profound of all the statesmen of his time. He commanded several military expeditions, and exhibited the qualities of a consummate general. He had a handsome and dignified person, a sweet and powerful voice, and a most persuasive manner. Aristophanes says, "he thundered and lightened and stirred up all Greece." Of his eloquence, only a few sentences, quoted by Plutarch, remain, if we except the speeches recorded in Thucydides, which do not purport to be literally such as he delivered them. The best character of this great man is the one drawn briefly and tersely by Thucydides. "The cause of his influence," says that great writer, "was that, powerful in dignity of character and wisdom, and having conspicuously shown himself the most incorruptible of men, he curbed the people freely, and led them instead of being led by them. For he did not speak to their present favor, endeavoring to gain power by unbecoming means, but dared to brave their anger while holding fast to his own dignity and honor. The constitution was a democracy in word; but in fact it was the government of the most distinguished citizen." With slight interruptions, the administration of Pericles, as we may call it, lasted from 469 to 429 B. C.—the long period of 40 years. The government was carried on through the usual agencies. Pericles held no permanent office, though he was often appointed to places of trust and honor by the popular vote. He maintained his lofty station solely by the force of character, and by extraordinary ability. In his time, every branch of literature flourished. The great names of *Æschylus*, *Sophocles*, *Euripides*, *Aristophanes*, in dramatic poetry; of *Phidias* and his school in plastic art; of *Anaxagoras* and *Socrates* in philosophy, are connected with this period. The treasury of *Delos* was removed to Athens, the amount of contributions increased beyond the assessment of *Aristides*, and the Athenians, having assumed the protection of the confederacy, assumed also the right of using the funds for any purpose they pleased. The policy of Pericles was to make Athens not only the political head of the states, but the centre of art and literature—the school of civilization. Public buildings of extraordinary splendor were erected by the ablest architects. The temple of *Theseus* was already completed, the exquisite little temple of the *Wingless Victory*, on the right of the ascent to the *Acropolis*, was probably built in the time of *Cimon*. The temple of the *Olympian Zeus*, begun by the *Pisistratidæ*, had been neglected, and was not yet finished. The great structures of the *Periclean age* were, the *Odeum*, finished 444 B. C., the *Parthenon*, 387 B. C., the *Propylææ*, 432 B. C., the *Erechtheum*, which was not quite completed at the breaking out of the Peloponnesian war. This magnificent system of public works was under the general su-

perintendence of the sculptor Phidias. The architects of the Parthenon were Ictinus and Callicrates. Mnesticus was the builder of the Propylæa. Plutarch gives an animated description of the busy aspect of the city while these works were going on: "Then the mechanics were not without their share of the public money, nor yet received it to maintain them in idleness. By the building of great edifices which require many arts and a long time to finish them, they had equal claims to be recompensed out of the treasury with the mariners, soldiers, and garrison troops, though they stirred not from the city. For the different materials, such as stone, brass, ivory, gold, ebony, and cyprus, furnished employment to carpenters, moulders, braziers, stonecutters, goldsmiths, ivory painters, turners, fancy workers, and other artisans; those employed in transporting the materials by sea, such as merchants, sailors, and pilots; and those employed on land, such as wheelwrights, wagoners, drivers, ropemakers, linen-workers, leather-cutters, road-makers, iron foundry, and every art and trade had its subordinates ranged in proper order, to execute the commissions, like soldiers under the command of a general. Thus, by the exercise of these different trades, was plenty diffused among persons of every rank and condition." The works of Phidias are still the teachers of the purest principles of sculpture. The Parthenon reveals perfections in artistic skill and the practical application of scientific principles, which have never been approached in any modern structure. The buildings of the Acropolis, and the innumerable other works of art which were accumulated there, made that rocky height not only the centre of Hellenic religion, but the noblest gallery of art in the ancient or modern world. The embellishment of the city and the progress of its political power, as well as of its commercial prosperity, were interrupted by the fatal Peloponnesian war. The jealousy of Sparta was excited by the overshadowing power of her ancient rival. The hostile feeling was increased by enmity of race, the Spartans being the conspicuous representatives of the Dorian stock, and the Athenians of the Ionian; and by differences of political organization and domestic institutions. The contrast between the two characters, and the respective influences under which they were moulded, are nowhere so ably drawn as in the funeral oration by Pericles. The orator, while commending the generous and liberal spirit of the Athenian institutions, silently points to the opposite characteristics of those of Sparta. The citizens not only enjoyed an equality of rights before the law, but cherished a noble confidence in each other in private life; they cultivated obedience to the magistrate, and a fine sense of honor, which submitted to the unwritten laws of noble conduct, both from the self-respect of gentlemen, and from a sensibility to the shame attached to their violation by public opinion. "For such a country the heroes of past ages laid down their lives, receiving

a most distinguished sepulchre, not so much that in which their bodies lie buried as that in which their glory, on every occasion of word or deed, shall be held in everlasting remembrance. For of illustrious men the whole earth is the sepulchre, signalized not alone by the inscription of the column in their native land, but in lands not their own, by the unwritten memory which dwells with every man, of the spirit more than the deed." The Peloponnesian war broke out 431 B. C. The Lacedæmonian troops ravaged the plain of Athens, and the inhabitants of the country crowded into the city. In the next year, 430 B. C., a second invasion took place, and the plague, so powerfully described by Thucydides, carried off not less than a fourth of the inhabitants, beside causing the most frightful demoralization. The children of Pericles were among the early victims, and the great statesman himself was carried off in the following year, leaving no one to take his place. "Those who came after him," says Thucydides, "being more on an equality with one another, and each eager to stand foremost, made it their aim to gratify the passions of the people, and to this object sacrificed the public interest." This is not the place to relate the varying fortunes of this long and most disastrous war—the expedition sent out by Athens to Lesbos; to Sphacteria; to Thrace; the truce for a year; the banishment of Thucydides, who afterward made his name immortal by his history; the truce agreed upon for 50 years, which lasted only nominally 7 years, and really hardly one; the expedition to Sicily, which commenced with so much pomp and splendor, and such vaunting expectations, and ended so deplorably in the third year; the occupation of Decelæia by the Lacedæmonians; the revolt of Lesbos; the overthrow of the democracy, and the establishment of the council of the Four Hundred; the battle of Arginusæ, and the condemnation of the generals; the defeat of the Athenians at Ægospotami, which led to the surrender of Athens in 404 B. C., to the Spartan general Lysander. The democracy, which had been restored, was again abolished, and a government of Thirty established, under the control of Sparta, known in history as the Thirty Tyrants. The cruelties and excesses of this odious oligarchy are related by Xenophon, who took up the history of Athens at the point where that of Thucydides breaks off. The walls of Athens were demolished by the Lacedæmonians, the arsenals and docks at Piræus destroyed, and the political exiles favorable to oligarchy were restored. But the period of oligarchical tyranny was destined to be short. A body of exiles, headed by Thrasybulus, were concentrated at Phyle, one of the frontier fortresses in the pass of Mt. Parnes; from thence they proceeded to Piræus and defeated Critias and his troops, and finally overthrew the Thirty and restored the reign of the ancient laws. But the disasters of Athens in this terrible war struck so deeply at the roots of her power and greatness that she never fully

recovered from them. Thenceforth her career, though glorious in many respects, and though her influence was partially restored, was one of struggle against superior and hostile forces. Yet it is singular that the intellectual activity of this highly gifted race does not appear to have abated even during the most calamitous years of the war. Dramatic and lyric contests for the prize took place yearly; the splendid games and the religious pomps were celebrated; the arts were cultivated and practised, as if no external troubles were exhausting the resources of the state, and preparing her downfall. And after the war was over, and the democracy was restored, the city was again as before the centre of cultivated society: the favorite home of poets and philosophers, and the school of the arts. Political eloquence flourished even with greater brilliancy than in the days of the Attic supremacy; for in the next great struggle, the genius of Demosthenes shone with unrivalled splendor. Dicaearchus, a contemporary of Aristotle and Demosthenes, and the author of a work on the "Life of Hellas," says in a fragment of that book, that Athens was ill supplied with water, and irregular, on account of its antiquity; the houses (*i. e.* the private dwellings) generally mean and insignificant; so that a stranger would at first hardly believe this to be the celebrated city of Athens. But when he should behold the superb theatre; the costly temple of Athena, called the Parthenon, overhanging the theatre; the temple of Olympian Zeus, which though unfinished, fills the beholder with amazement by the magnificence of its plan; the three gymnasia, the academy, the lyceum, and the cynosarges, all of them shaded with trees, and embellished with grassy lawns; having witnessed the haunts of the philosophers, and the various schools, and the festive scenes by which the cares of life are cheated of their prey, he would have another impression, and would believe that this was in very truth the famous city of Athens. The hospitalities of the citizens make the stay of the stranger agreeable. The city abounds with supplies for every want, and the means of gratifying every desire. The neighboring towns are but suburbs of Athens. The inhabitants are forward to recognize the claims of any artist; and though among the Attics there are busy-bodies and gossips, who pass their time in spying out the way of life of strangers, yet the genuine Athenians are magnanimous, simple in manners, trusty friends, and accomplished critics. In the arts, in short, as much as other cities excel the country in the means of enjoyment, so much does Athens surpass all other cities. As Lysippus says:

Hast not seen Athens, then thou art a log,
Hast seen and not been charmed, thou art an ass.

—The period between 408 B. C. and 360 B. C., usually designated as that of the Spartan and Theban supremacy, is signalized by the extraordinary adventures of Xenophon, the Athenian, in the expedition of Cyrus the younger,

and the retreat of the Ten Thousand, and the war of the Lacedæmonians, under Agesilaus, in Asia Minor; the Corinthian war; the peace negotiated by Antalcidas and bearing his name in history, 387 B. C.; the partial reorganization of the Athenian confederacy; and by numerous distant expeditions, both by the Lacedæmonians and the Athenians. The principles of the new confederacy were substantially the same with that of Delos. The states and cities composing it were to be politically independent, and the common affairs were to be placed in the hands of a body of deputies, meeting in congress at Athens. Demosthenes was born in the Deme of Paiania, near Athens, in 382 B. C., the year of the first attack upon the Olynthians by the Spartans. Isocrates, the Athenian rhetorician, was writing and publishing his political discourses, especially the elaborate eulogy on Athens and her institutions, entitled the *Panegyricus*. In 361 B. C. a general peace was concluded by consent of all parties except the Lacedæmonians; but in the following year, the Athenians went to war with the Olynthians, for the possession of Amphipolis, and this war brought them into collision with the formidable power of Macedonia, under the able lead of Philip, and after his death, under that of his still abler son, Alexander. The period of struggle between Athens and the Macedonian power, is not only very important in the history of the city, but in some respects is the most brilliant for the intellectual achievements of the great Athenian leaders. Political eloquence, which had long flourished under the influence of the democratical constitution of Athens, reached and passed its culminating point, in the orations of the political leaders, which fortunately have come down to us. Of course, those of Demosthenes stand at the head, not only of Greek and Roman eloquence, but of the political eloquence of the free nations of modern Europe. Philip and Demosthenes were probably born in the same year, 382 B. C. Philip succeeded to the throne of Macedonia at the age of 23, and in the same year Amphipolis was declared a free city, and peace was made in 359 B. C. In the next two years Amphipolis was taken; the Athenians sent an expedition to Euboea; Chios, Rhodes, Byzantium revolted from Athens; the Phocians seized Delphi; and the so-called Sacred War commenced. In 356 B. C. Alexander was born, and Potidæa was taken by Philip. In 355 B. C. the war between Athens and her former allies was concluded, and in the following year, 354 B. C., Demosthenes began his career as a *rhetor* or statesman, and made public speeches in the assemblies at the age of 28, having already appeared before the dicasteries, or courts, in several civil causes. He had educated himself carefully for a political career, although he had been left an orphan at a tender age, and his inheritance had been partly squandered by his faithless guardians. The first exhibition of his

remarkable ability was given as soon as he reached the legal age, in the prosecution of his guardians. The arguments delivered by him before the court are distinguished by clearness of statement, chasteness of style, and logical power. They are business speeches, and give us not only a high idea of the talent of the young pleader, but of the sedate and rational proceedings of the court before which the cause was tried. Of the special studies of Demosthenes, we know but little. In the oration on the Crown, he speaks of his early education as being that of an Athenian gentleman in easy circumstances. There is some reason to suppose that he was not ignorant of the philosophy of Plato, whom he knew personally and esteemed; and that he was instructed by Isæus, whose style was apparently the model on which the speeches against his guardians were composed. He became a member of the *Boule*, in 354 B. C., and in the same year delivered several public orations. At a very early period he took the ground of uncompromising hostility against the encroachments of King Philip, whom he regarded as a very able, ambitious, and unscrupulous enemy to the liberties and independence of Greece. In the contest that ensued, he never shrank from the perils of his position. The threats of domestic factions, the slanders of private and public foes, the offers of the rich, the blandishments of Philip's agents, had no power to seduce the incorruptible integrity of the great Athenian. In youth he had been of feeble health; he had a voice of no very pleasant quality, and defects of enunciation, both of which seemed to disqualify him from taking part in the debates of the Pnyx, if not from pleading in the courts. But he had received at his birth a genius which no physical difficulties could stifle. His mind was clear and strong, and was well trained by careful study. His passions were subdued to his will by the austere temperance; so that, in after years, his profligate opponents taunted him with being a water-drinker. Strenuous industry conquered his physical deficiencies. The lessons of a noble philosophy, harmonizing with the natural loftiness of his character, gave him a grand style of thought, and inspired him with a profound contempt for baseness and cowardice of sentiment, and weakness of action. He had formed in his mind an august image of his country and her ancestral glories; and as he looked around him from the Bema, the spirits of the great men who had stood on that spot, and whose genius had made Athens what she was—the glory of the Hellenic world—seemed to lift him above all selfish aspirations, and to inspire that sublime political morality, which even now elevates the soul of the reader. The sentiments of national and personal honor, the duty of following the example of illustrious forefathers, of maintaining the proud position once taken as the unshrinking defender of the freedom of Greece, and of leaving the consequences in the hand of God, were never more boldly

proclaimed than in his great orations. The style of Demosthenes is the man Demosthenes. Simple, but at times rising into the loftiest regions of eloquence; calm generally, but impassioned when the occasion justifies passionate expression; nervous; with never a superfluous word; never wandering into loose declamation; sparing of ornament, according to the most rigid requirements of Attic taste; but sometimes employing a striking and beautiful figure, which not only electrifies the imagination, but enlightens the reason; severely logical, and exhibiting every turn of the thought through its texture; as transparent as the stream from the crystal fountain; the style of Demosthenes is the highest perfection of human speech, the admiration of critics, the despair of imitators. The style of Demosthenes was Demosthenes, and it was with this marvellous genius, and the intellectual armor which that genius wielded, enforced by incorruptible patriotism, and courage that never quailed, capacity for labor that never wearied, liberality that never was exhausted, passionate love of Athens that never grew cold, boldness of determination that never hesitated when the judgment was once decided,—it was with this formidable array of hostile forces, gathered and concentrated in one slender, nervous man, that the wealth and military power, and despotic will of Philip, had to contend. In some respects the contest was unequal; but not so unequal as it is sometimes represented. Honor, truth, eloquence, genius, incorruptible integrity, unseduced patriotism, are mighty, and must in the end prevail. The disastrous battle of Chæronea, which killed with report Isocrates, the old man eloquent, placed the fortunes of Hellas in the control of Philip; and later still, after the death of Philip and Alexander, the mercenaries of the Macedonian pursued the exiled Demosthenes to his asylum in the temple of Poseidon, at Calauræa, from which he could see the shore of Attica. His asylum was violated; he swallowed poison, and escaped the insults of his enemies by death. How stands the case now? How stand the mighty combatants before the tribunal of posterity? Whose influence is now felt for good? Which has gained the victory in the course of the ages, and on the battle-ground of history? The particulars of the conflict between Athens and Macedonia belong to the general history of Greece, rather than to the sketch of Athens, which is all we can give here. But the life and labors of the great orator and statesman are so identified with the illustrious city, that so grand a figure could not be omitted, even in this brief glance at her fortunes. The battle of Chæronea, between the army of Philip on the one side, and the combined forces of Athens and Thebes on the other, was fought in 338 B. C. When the news arrived at Athens, it produced the liveliest alarm. Measures were instantly taken to place the city in a state of defence, and Demosthenes was elected superintendent of fortifica-

tions. In executing the works committed to his charge, he added a considerable sum from his private fortune to the public appropriations. He was also appointed commissioner for the purchase of corn. The inhabitants of the rural districts were summoned to leave their residences, and take refuge either in the city or in the frontier fortresses of Phyle, Eleusis, and Sunium. An immediate invasion of Attica was expected, and every thing that the most untiring and fearless energy on the part of Demosthenes could do to meet the impending danger, was done. It was made a capital offence to leave the city. Either these vigorous measures of defence, or the deep policy of Philip, prevented him from following up his victory, and Athens was spared the horrors of a siege. His immediate aim was to place himself at the head of the united forces of Greece, and to invade Persia; a scheme that was looked upon with favor by some of the Athenian statesmen. Isocrates had advocated it, placing confidence in the intentions of Philip, until the battle of Chaeronea opened his eyes. But all these ambitious purposes of his active and subtle intellect were suddenly ended by his assassination at Aegæ, in 336 B. C. The death of Philip, no doubt, was felt as a great relief by the party at Athens, of which Demosthenes was the head, and movements were initiated to throw off the Macedonian supremacy. But Alexander, then a youth of 20, quickly showed that his genius and his ambition were quite equal to his father's. Demosthenes exerted himself to the utmost to heal the dissensions among the Greek states, and to bring about a union against the Macedonians, but all to little purpose. Alexander was appointed to the command of the Amphictyonic forces; the Athenians were obliged to send an embassy to conciliate the haughty youth. A general congress at Corinth clothed him with the office of commander of the army for the Persian war. Disturbances, however, among the Triballians and Thracians, called him to the north, and during his absence an insurrectionary movement took place at Thebes, favored by Demosthenes and his party at Athens. Alexander marched upon the doomed city. It was besieged and taken. Its inhabitants were slain or made slaves, and the houses, except that of the poet Pindar, were demolished. The Cadmeia, or citadel of Thebes, was occupied by a Macedonian garrison. The surrender of the leading Attic orators was demanded by Alexander, but the demand was not pressed to compliance. Alexander crossed the Hellespont, and commenced his career of Asiatic conquest in 334 B. C. His wonderful successes gave heart to the Macedonian party in the Greek states, and maintained an ill-omened tranquillity at Athens. The most important events were the trial of Otesiphon, on a charge, by Æschines, of violating the constitution, and the arrival of Harpalus at Athens, a few years later, from Asia, with an immense treasure, of which he had robbed Alexander.

The former transaction had its origin in political hostilities between Demosthenes and Æschines, as leaders of opposite parties. The proceeding was instituted soon after the battle of Chaeronea, the calamitous result of which was charged upon the policy of Demosthenes. Notwithstanding this apparent disadvantage, the people retained unshaken their confidence in Demosthenes, as they showed by appointing him to important public offices, and by choosing him to deliver the funeral eulogy over those who had fallen on that disastrous field. But his enemies annoyed him by every form of legal persecution that the laws of Athens allowed. To put an end to these annoyances, Otesiphon, a political friend, proposed that a crown be conferred by the people of Athens on Demosthenes, for his past and present services to the commonwealth, and for his general merits as a good and loyal citizen. This was one of the modes of recognizing eminent public services. The proposition passed the preliminary stage, and was sanctioned by the senate, but before it could be carried into execution, it was necessary to receive the vote of the ecclesia. In the mean time, it could be arrested by any citizen who should see fit to interpose, by the process called *γραφὴ παρανομίας*, or indictment for illegal propositions, against the mover of the measure, on the ground that the facts on which the measure was recommended did not exist. Until this question was judicially decided, the original proposition for bestowing the crown was suspended. Otesiphon was the nominal object of the prosecution, but the real motive was to ruin Demosthenes, by a sweeping assault upon his public and private character. The actual trial, for reasons which it is not now possible fully to explain, was not held for several years. The exact time when it took place is uncertain, but the probability is that about 8 years were allowed to pass before the final battle was fought. If this opinion is correct, the trial was held in 330 B. C. At this moment, Alexander was in the full flush of his eastern conquests, and this may have been the reason for selecting that time to bring the question to a judicial decision. The partisans of the Macedonian interest were, of course, in full confidence in the strength of their position, and no more favorable time could be anticipated for the overthrow of their enemies. Mean time the rumor of the proceeding had gone abroad all over the Hellenic world. The greatness of the interests at stake, and the overbearing importance of the political questions involved, the fame of the rival orators, and the wonderful attractions of every description which the city of Athens held out to visitors, drew a larger crowd thither than had ever assembled on any similar occasion. The mimic interests of the tragic stage filled the city every spring with the lovers of letters and art, at the Dionysiac festival, but here was a deeper and more moving tragedy than those of the line of Atreus or Pelops; here was a profounder interest than the woes of Ædipus,

or the heroism of Antigone; here was the living interest of great principles, the fates of living and illustrious men; the stirring appeals of the most marvellous powers of oratory, inspired by personal passions, by hopes and fears, by love of country and dread of slavery, by reverence for the past and the prospect of glory in the future. No wonder every man of Hellenic culture, every man with a drop of Hellenic blood in his veins, should be eager to witness such a scene. *Æschines* brought to the contest distinguished ability, a powerful voice, well-trained action, great legal acuteness, wonderful skill in the enforcing of special points, a perfect mastery of all the topics of personal attack, resentment from past conflicts, and the sense that his position and influence as a public man hung upon the chances of success. *Demosthenes* brought the inspiring consciousness of a life consecrated, with no divided purpose, to the highest good of his country. He felt that, as far as he was concerned, she had never lost her honor; that no opportunity had been omitted by him, to remind his countrymen of their duties to the memory of their ancestors, and to themselves; that he had never counselled a mean action, an action that was not in accordance with the loftiest principles of public and private honor. He felt that his long political life would bear a review, and come out unharmed from the fiercest hostile attack; and he felt full confidence in the noble sentiments of his countrymen, whom he had not flattered in his public addresses, but had often sternly rebuked. He knew they understood him, and appreciated his courage, his integrity, his disinterestedness, the austerity of his morals, his lofty standard of public conduct, for individuals and for states. He did not hesitate, he did not doubt his success, in the midst of the disheartening political circumstances of the time. He did not misjudge his own position, he did not mistake the character of his countrymen. The court was crowded, all the neighboring spaces were crowded with a densely packed and eager multitude. The orators were thoroughly prepared. They both acquitted themselves as they had never done before; but brilliant as was the oration of *Æschines*, his great rival rose to an immeasurable height above him. The clearness of his narrative, the force of his invective, the nerve of his language, the irresistible conclusiveness of his argument, the splendor of his occasional illustrations, the sublimity of his sudden apostrophe to the heroes of Marathon, and Salamis, and Plataea, who lay buried under monuments raised by a grateful country, the lofty ethical sentiments breathing through his animated sentences, produced their natural effect upon the minds of the dicasts, and *Æschines* did not receive votes enough to save him from the penalty denounced by the laws against the malicious accuser. This result was no less honorable to the people than to *Demosthenes*, and this scene clothed the day with an eternal interest for the statesman, the

scholar, the moralist. It is, for all time, one of the most conspicuous glories of the city of Athens. We have dwelt upon it at this length, because we regard it as eminently characteristic of the general tone and temper of the illustrious state in which it occurred. *Harpalus* arrived in Athens 5 years after this memorable trial. He employed his stolen gold among the popular leaders chiefly for his own personal security. The enemies of *Demosthenes* seized the opportunity of accusing him of accepting a bribe on this occasion. The Macedonian party was stronger than ever at this moment; and notwithstanding the contradictory statements of his accusers, the opposition which he had made to the reception of *Harpalus*, and the utter failure to produce a single fact in evidence against him, he was declared guilty by an overawed court, thrown into prison, but allowed to escape with the connivance of the magistrates, who were doubtless fully convinced of the absurdity of the accusation, and took this mode of absolving themselves for allowing the technical condemnation of an innocent man. For a time he resided at *Troezen* and *Ægina*, where he passed his days in looking across the sea, to his beloved Athens. When the news of *Alexander's* death arrived, 323 B. C., a fresh attempt was made to overturn the Macedonian supremacy. *Demosthenes*, though in exile, joined the ambassadors, and again employed his matchless eloquence in patriotic devotion to the cause of his country's independence. The people eagerly passed a decree recalling him from exile. A public trireme was sent over to *Ægina* to bring him home. The whole population met him at *Piræus*, and escorted him in joy and triumph up to the city. So nobly did they atone for the momentary timidity of one of their courts; and this again was a scene highly characteristic of the tone and temper of the people of Athens. The contest was renewed. *Leosthenes*, the Athenian, defeated the army of *Antipater* the Macedonian general, at *Lamia*, a short distance north of the pass of *Thermopylæ*; but the triumph was only momentary; and the defeat of the Greek forces at *Crannon* in *Thessaly*, once more placed the Macedonians in the ascendant. The Lamian war closed with the unconditional surrender of Athens to *Antipater*. *Demosthenes* and the other orators, who had made themselves obnoxious to the brutal vengeance of the Macedonian soldiers of fortune, fled. They were torn from their sanctuaries. *Hyperides* was cruelly murdered at Athens. *Demosthenes*, as has already been stated, escaped a worse fate by taking poison at *Calauria*, in the temple of *Poseidon*, dying there, in 322 B. C., at the age of 60. The leaders of the opposite party, the most honorable of whom was the austere and incorruptible *Phocion*, were treated with equal cruelty. From this time, Athens became the victim of the contending chiefs of Macedonia. *Demetrius*, the *Phalerean*, ruled Athens 10 years, supported by a Macedonian garrison, but in 306 B. C. *Demetrius*, the son of *Antigo-*

nus, surnamed Poliorcetes, the besieger of cities, was sent from Ephesus by his father, and compelled his namesake, the Phalerean, to surrender the city. The conqueror announced to the people the restoration of their ancient constitution, and was the object of extraordinary honors and the most degrading flatteries, on the part of the mob, who were now like sheep without a shepherd, all their great men having disappeared or perished. Athens continued under the Macedonian influence, down to the conquest of Greece by the Romans, though nominally governed by her own laws, under the administration of her own magistrates, and preserving her ancient customs, rites, festivals, and ceremonies of every description. In 200 B. C., the last Philip of Macedonia was involved in a war with Rome, in consequence of his having furnished aid to the Carthaginians. Athens suffered from his barbarism, she having taken sides with the Romans in order to throw off his oppression. The city was relieved by a Roman fleet; but before Philip withdrew from the siege, he laid waste the gardens and suburbs, including the lyceum, and the tombs of the Attic heroes, and destroyed the temples that stood on the Attic plain. Philip was defeated at the battle of Cyncephalæ, in 197 B. C., and in the following year Greece was declared free by the Roman consul Flaminius, at the Isthmian games. But war was again renewed by Persæus, and the Macedonian empire was finally overthrown by Lucius Æmilius Paulus, in 167 B. C. In 147 B. C., war broke out between the Achæan league and Rome, but it was closed in the following year with the capture and sack of Corinth, by the consul Mummius, and the year 146 B. C. saw the whole of Greece reduced to a Roman province, under the name of Achaia. Under the Romans, Athens was prosperous and respected. She became the teacher and conqueror of her conquerors. Her schools of eloquence and philosophy were open to the civilized world. The sons of princes and of distinguished Roman citizens were sent there to complete their education under the ablest masters. Her splendid temples remained uninjured; the magnificence of the city had been increased by the liberality of foreign potentates. Ptolemy Philadelphus, in 275 B. C., had built a gymnasium near the temple of Theseus. Attalus, king of Pergamus, in 240 B. C., had embellished the Acropolis with groups of statuary. In 174 B. C., Antiochus Epiphanes renewed the work upon the great temple of Olympian Zeus; and numerous other foreign contributions, beside the single productions of native artists, in every department of art—in painting, statuary, especially the portraits and statues of illustrious citizens—were added to the treasures of the city. Athens occasionally suffered during the civil wars. She took part with Mithridates, and was besieged and captured by Sylla, who destroyed the Long Walls, and the fortifications, annihilated the commerce of Piræus, and left the city so crippled in all her resources,

that she never recovered from the blow. When the orators sought an interview with the ferocious general and reminded him of their past renown, and the glories of Marathon, he gruffly answered, "I was sent here to punish rebels, not to study history." His soldiers plundered the city and slew the citizens, until the tide of blood flowed into the Cceramicus. The groves of the academy and the lyceum were cut down, and columns were carried off from the temple of Olympian Zeus, to adorn some public building at Rome. But these public calamities still left Athens the distinction of being the intellectual capital of the civilized world. She was still crowded with works of art, and her schools were still the resort of the highest class of Roman youth, and of the men of the largest culture everywhere. Atticus, the friend of Cicero and of Pompey, resided there many years, in the enjoyment of a refined ease and literary leisure. Cicero sent his son to complete his studies, where he had himself received instruction from the ablest teachers of philosophy and eloquence. Of the precious letters of the great Roman orator, his correspondence with Atticus, while in Athens, and with his own son, while engaged in his studies, is among the most interesting and entertaining. Cicero repeatedly visited the city. Once, on arriving at the gates, before entering he turned off, and pursuing the road through the olive grove, north of the city, paid his homage to the academy, which the eloquence of Plato and a long line of eminent successors had made immortal. It was from Athens that Sulpicius addressed the letter of consolation to Cicero on the death of his beloved and accomplished daughter. Horace and Virgil studied in Athens, and nurtured their genius with her abundant and still living literature. The establishment of the empire made but little difference in the condition of Athens. She still continued the school for the education of the high-born youth of Rome, and her literature furnished the models, both in poetry and prose, for the imitation of the Augustan literature of the imperial city. Her artists were employed to build the temples and chisel the statues, which made the Augustan magnificence of Rome. Her language was studied and spoken by the highest society; and in the Roman schools Greek was taught at the same time with the mother tongue. The transcendent event in the reign of Augustus, was the birth of Christ in Judæa, and the planting of the Christian religion. One of the most remarkable transactions in connection with this event was the appearance of St. Paul at Athens, and the great discourse delivered by him from "the midst of Mars Hill" to the assembled philosophers and citizens there. This great teacher of the Christian faith was familiar with letters and philosophy by his early education at Tarsus, which almost rivalled Athens, as a centre of Greek learning and eloquence. He visited Athens probably about the middle of the 1st century of our era. Walking in the agora like any other

stranger, he met with some of the philosophers and men of letters who daily haunted that busy centre of Athenian life. According to the custom of the place and the men, they fell into a discussion, in which the apostle, in his earnest and impressive manner, advanced the new doctrine, which it was the business of his life to diffuse. They were chiefly Stoics and Epicureans whom he encountered, because the stoa, the resort of the former, was in the agora; and the gardens of Epicurus, the haunt of the latter, were not far off on the bank of the Ilissus. The academy was distant a mile and a half north of the city, and the lyceum was at a considerable distance east, so that the Academics and Peripatetics, with whose doctrines he would most have sympathized, were not, at least in any considerable numbers, present at the conversation. Yet the cultivated persons whom the apostle met were evidently much impressed by the novelty of St. Paul's doctrines, and the solemn earnestness of the man. They courteously invited him to ascend the Areopagus, where he might speak more at length, and where they, sitting at ease and beyond the noise and bustle of the agora, might more conveniently hear him. The Areopagus was the most sacred and venerable spot in the city. The legendary associations of the heroic age, and of the most ancient religion, clustered around it. Here was the seat of the oldest and most venerable court, the members of which were citizens who had blamelessly discharged the highest functions of the state. At its south-eastern angle was a dark and solemn cavern, near which stood a revered temple of the Eumenides, on the spot where Oedipus was mysteriously taken from sight, after a life of unequalled woe, foredoomed by fate. It was up this sacred height that the great apostle was taken by the Athenian scholars and sages, and on that revered summit, surrounded by the magnificence of Athens, and under the soft blue sky, which looked down upon the scene with its smiling serenity, that he delivered that memorable discourse, in which he showed the generous courtesy of the gentleman, the highest gifts of the orator, and the unshaken fidelity of the servant of Christ. We can form some judgment of its grand and impressive character from the masterly sketch in the 17th chapter of the Acts, and from the fact there recorded, that among the immediate converts to the fervid and bold eloquence and irresistible logic of the Christian orator, was one of the foremost citizens of Athens, Dionysius the Areopagite. The discourse made its mark outside the religious circles. The candid and accomplished Longinus, born in the 3d century at Athens, a follower and teacher of the Platonic philosophy—so learned that he was called a living library and a walking museum—a man also experienced in affairs—having been the confidential adviser and friend of Zenobia the queen of Palmyra—a writer whose elegant work on "Sublimity" is still one of the best manuals of criticism—a scholar, familiar not only with Pagan, but with

Jewish, and probably with whatever Christian literature existed in his day,—and perhaps personally acquainted with the principal Christian teachers who were his contemporaries,—uses this remarkable language, in a fragment of one of his critical treatises: "The crowning flower of Hellenic genius and eloquence is to be found in Demosthenes, Lysias, Æschines, Aristides, Timarchus, Isocrates, Xenophon—to these I would add Paul of Tarsus, one of the first founders of an unproved doctrine." Longinus was not a Christian, as the last words of this extract show; but he was a man of a gentle temper, and a comprehensive spirit. His language shows that the discourse of St. Paul had become one of the great traditions of Athenian eloquence, and that Longinus regarded him as worthy to stand on a level with the great masters of the Bema. The scene of St. Paul preaching on the Areopagus was also characteristic of the tone and temper of the citizens of Athens. The Emperor Hadrian, in the first part of the 2d century, was a devoted lover of Greek art and literature. Athens was the special object of his beneficence. He finished the temple of Olympian Zeus; established a public library; built a pantheon and gymnasium. The arch which he constructed is still standing near the north-east angle of the Olympieum, and the inscription which claims the south-eastern quarter of the city as the city of Adrian is still legible, as well as that on the side toward the Acropolis, which recognizes all that part as "Athens, the city of Theseus." In the same century Herodes, a native of Marathon, and surnamed Atticus, a man of learning, eloquence, and vast wealth, and educated by the best masters of Athens, distinguished himself, not only as a teacher of the Roman youth—numbering among his pupils Marcus Aurelius himself—but by the costly additions he made to the splendors of the city of his choice. He lined the enormous stadium of Lycurgus, in the south-east quarter of the city, with marble seats for the whole population of Athens. He built at the south-west angle of the Acropolis the theatre which bears the name of his wife Regilla. He left many literary works, but time has swept them all away, while sparing the monument which has saved the name of his wife from oblivion. The emperor Marcus Aurelius increased the number of the Athenian schools and the salaries of the teachers. When Pausanias visited Athens in this period—about the middle of the 2d century—the city must, externally, have presented its most magnificent appearance. It is to his careful, minute, though somewhat dry details, that we are indebted for some of our knowledge of what ancient Athens was. He saw the city when its public buildings were untouched by time, and had not as yet fallen under the hand of the spoiler. The works of the great artists which occupied the Acropolis, the agora, the temples, and the streets, were still standing. The statue of Athena Promachos still seemed to guard the citadel; Harmodius and Aristogiton,

still stood on the western ascent to the Acropolis. The eponymic heroes still adorned the agora, and the bronze statue of Demosthenes still reminded the stranger and the citizen of the great days of Athenian patriotism and eloquence. Hegesias, the historian, a little later, gave up the enumeration of the wonders of Athens with the exclamation: "All cannot even be mentioned, the Athens was built by the gods, and by ancestral heroes;" and Aristides, the rhetorician, in the time of the Antonines, said: "The greatness of the city and its splendor correspond with its fortune in other respects, and with the great name of the inhabitants. Art here vies with nature. A pure and mild sky encompasses the land. . . . Of art it is difficult to select the best. Here are the largest and most beautiful temples; here are the noblest statues, both old and new. Were we to cast aside its ancient renown, its trophies by land and by sea, its orators and heroes, and all the achievements with which it has filled up the long period of its existence, still the objects we see before us now will give it the foremost rank among all the cities in the world." So the city remained for many years. About the middle of the 8d century the Goths, crossing the Hellespont and Ægean, descended upon Attica. Athens made a brave defence under the inspiration of the scholar and philosopher Dexippus. He addressed the citizens in an eloquent harangue, a part of which has been preserved. "I am resolved," said the brave philosopher, "to share your fate in fighting boldly for all we most prize on earth; and be assured that, through me, the glory of Athens shall never be sullied. It becomes us to remember the deeds of our fathers; to show ourselves as an example of bravery and freedom to the other Greeks, and to secure to ourselves in the present and future generations the imperishable renown of having proved by our actions, that the courage of the Athenians remains unbroken, even in adversity. We march to battle to defend our children and all we hold most dear. May the gods be our support." Athens suffered somewhat at the hands of the barbarians, but they were driven at length tumultuously out of Attica. It is related by Zonaras that one of the Gothic chiefs, finding a party of his soldiers on the point of burning the libraries of Athens, having collected the books in a pile, told them to leave those things to the effeminate Greeks, for the hand accustomed to the smoothness of the papyrus would feebly grasp the brand of the warrior. In A. D. 258, a few years before the arrival of the Goths, the walls, which had been in a ruinous condition since the siege of Sylla, were repaired by Valerian. In A. D. 396, Alaric came down, like a storm, from the North, ravaging fields and plundering towns on the way. He advanced upon Athens, eager to capture the city and rob the temples. But he was disappointed. Either the fortifications were too strong or he was too impetuous to submit to the slow pro-

gress of a siege. At all events, instead of assaulting the city, he accepted the hospitalities of the magistrates, and retired loaded with gifts, leaving Athens and Attica unharmed. A tradition is recorded by Zosimus, a writer of the 5th century, that as Alaric advanced with his barbarian host, he beheld Athena Promachos marching along the walls of the Acropolis, completely armed, as she was represented in the statue of Phidias, and by her side the hero Achilles, such as Homer describes him when burning to avenge the death of Patroclus. Alaric, frightened by the sight, abstained from assaulting the city, and sent in heralds with propositions of peace. This curious story may be so far founded in fact, that to the superstitious mind of the ignorant barbarian, the armed and lofty figure of the goddess appeared like the goddess herself guarding her own citadel. It shows at least that the statue was standing in the 5th century. We have seen that Christianity was preached in Athens by St. Paul, and that converts were gained among the highest classes. We have few details, but it seems probable that the new religion found adherents among thinking men there, from that time forward. The rites of the ancient religion were, however, publicly celebrated for a considerable time after Christianity had ascended the throne in the person of Constantine the Great. The schools of philosophy continued down to the reign of Justinian, in the 6th century. Athenian learning and Athenian taste were still celebrated all over the world, and Athens continued to be the resort of students of every rank and condition, both pagan and Christian. The early years of the emperor Julian were studiously passed in Athens. In his letter to the Athenians on quitting their city, he exclaims: "What fountains of tears did I shed, what lamentations did I utter, stretching my hands up toward the Acropolis, when I invoked and supplicated Athena to save and not to abandon her servant." Gregory of Nazianzus, the great Christian orator, was one of the fellow-students and friends of Julian, though afterward, when the latter apostatized from Christianity, he became a bitter and very able opponent. But Gregory and Basil, as well as Julian, delighted in their residence at Athens. They, with other young men of congenial tastes, formed a society, which was bound together by the common ties of literary pursuits, Christian faith, and devotion to a Christian life. "The day of our departure," says the former, "and all the circumstances of our departure, arrived—the farewell words, the attendance to our ships, the last messages, the lamentations, embraces, tears. Nothing is so painful as for friends to be severed from Athens, and from each other. Our companions, and some of the professors, surrounded us and entreated that we would desist from our purpose. With Basil it was ineffectual, and he departed; while I, who felt myself torn asunder by the separation, speedily followed him." The passion of

Gregory for Athens was so strong that he delighted in being called Philathensius. In the 5th century Athens was deprived of some of her treasures of art. Many pictures were taken by the proconsul from the Stoa Poikile—among the rest the paintings of Polygnotus, representing the capture of Troy, and the battle of Marathon. The great statue of Athena Promachos probably disappeared in this century. Synesius, in one of his epistles, speaking of his intended journey to Athens, makes a sarcastic allusion to these transactions. The letter is curious also as exhibiting the regard in which Athenian culture was still held. "I shall not only," writes he, "derive this benefit from my journey to Athens, to be freed from my present troubles, but I shall no longer be compelled to worship for their learning, those who come from thence, and who are in no respect superior to us common mortals; certainly not, in comprehending Aristotle and Plato. They move about among us like demigods among mules, because they have seen the academy, the lyceum, the painted stoa, in which Zeno philosophized—now the painted stoa no longer; for the proconsul took away their panels, and put an end to their philosophic pride." Other passages in his letters show in what esteem the arts and handicrafts of Athens were held in other cities, especially Alexandria. In this same century, the beautiful Athenais, daughter of the Athenian philosopher Leontius, became a Christian, was baptized at Constantinople under the name of Eudocia, married the emperor Theodosius II., and did much by the influence of her example, and by building churches, to promote Christianity in Athens, the local government having recently authorized, by direction of an imperial rescript, the public recognition of Christianity there. It appears that orders were given from Constantinople to destroy the pagan temples. Gregory declared against the injurious influence of the idols, which, according to him, more abounded there than elsewhere in Greece. The edicts of the emperors were not carried into execution, and many of the temples were saved by being converted into Christian churches. The temple of Olympian Zeus was consecrated to Christ the Savior, the Parthenon to the Holy Wisdom (St. Sophia), afterward changing the designation to the Panagia, and the Mother of God, the temple of Theseus to St. George of Cappadocia. Justinian, in the early part of the 6th century, withdrew the salaries from the public teachers in Athens, and prohibited instruction in philosophy, partly because the schools were antagonistic to Christianity, and partly to devote the money thus saved to the embellishment of the capital, and the building of the church of St. Sophia. From this time forward Athens sank into the position of an obscure provincial town, and her name is seldom mentioned by the historians occupied with the affairs of the eastern empire. We scarcely hear of the city for nearly 4 centuries. The

inhabitants doubtless led a peaceful life; the more ambitious spirits seeking their fortunes at the imperial court of Constantinople. Heathenism entirely died out; Christianity, under the complicated forms and liturgies of the eastern church, took its place. The city was furnished with numerous small churches, built in the peculiar style of architecture called Byzantine, and probably some of the materials employed were taken from the ancient structures. In the 12th century we hear of Athens being taken and plundered by Roger, king of Sicily, whose devastations of other parts of Greece struck a severe blow to the prosperity which appears to have been silently advancing for 2 centuries. The 4th crusade again brought the name of Athens to the notice of Europe. Greece was parcelled out among the Frankish princes after the capture of Constantinople in 1204. Otto de la Roche was made duke of Athens in 1205, and 4 successors of his family held the dukedom until 1308. Walter de Brienne succeeded. He was overthrown by the Grand Catalan company, whose aid he had invoked. A duke of the Sicilian branch of the house of Aragon was invested with the dignity by the Catalans, and in this line the dukedom remained until 1386. Six dukes of the Florentine family of Acciajuoli ruled Athens from A. D. 1386 to A. D. 1456. The ducal court of Athens was one of the most brilliant in Europe. The title of duke of Athens became familiar in the poetry and romantic literature of the West. Dante, a contemporary of Guy II. and Walter de Brienne, calls Theseus *il duca d'Athena*. Chaucer calls him, also, the duke of Athens. And finally, in the age of Queen Elizabeth, Shakespeare introduced the title in the "Midsummer Night's Dream," where Theseus, the conqueror and lover of Hippolyta, figures again as duke of Athens. Muntaner, the quaint old Spanish chronicler, declares that the Frank chivalry of Greece was second to none in Europe, and that the French language was spoken as well at Athens as at Paris. The Parthenon was consecrated to the Blessed Virgin, and the service of the Roman church was celebrated in Latin within its walls. The ducal palace was built near the Propylæa, where the revels and gayeties of the court drew together the most gallant knights of Europe, and the honor of knighthood was once conferred in the temple of Athena. Tilts and tournaments were held on the Attic plain, and the feudal system was partially imposed upon the people. But they were a ruling caste, living among a conquered nation, with whom they had no sympathies—of another language, and a hostile creed. When the storm of Turkish conquest swept over the land, they fell before it, and disappeared. But few memorials now remain of this chivalrous interlude in the history of Athens. On the Acropolis, an arched subterranean chamber, and an old tower on the right of the entrance; and in the crumbling monastery of Daphne, which occupies the site of an ancient temple of Apollo, two stone

coffins thrown carelessly into a dark room filled with rubbish, and known by the half obliterated fleur-de-lis carved on them, alone remind us, on the spot, of the dukes of Athens. In 1456, the year in which it was captured by Mohammed II., Athens appears to have been in a tolerably prosperous condition. The number of its inhabitants is said to have exceeded 50,000. The city was treated with unaccustomed mildness by the conqueror. He visited it in person, gazed with admiration upon its still existing wonders, granted important privileges to its inhabitants, placed its government in the hands of a high officer of his household, which secured it from the exactions and oppressions to which other conquered cities and states were subjected by the agas and pashas who were appointed to govern them. Having placed a garrison in the Acropolis, and exhibited many tokens of his good will, he took leave of the Athenians, and marched into Peloponnesus. In A. D. 1459, the sultan returned to Athens, and established himself in the quarter now called Patisia. It was at this time that the Parthenon was converted into a mosque, and the Moslem services were performed. In 1467, the Venetians went to war with the Turks, and invading Greece with a powerful fleet, landed at Piræus, and expelled the Turks from Athens, after a bloody battle. Athens remained under the Venetians until 1470, when the sultan entered Greece with a large army, and retook Athens. He made some changes in the administration of the local government, which he had hitherto left in the hands of native magistrates, only requiring the payment of an annual tribute to the Porte. He now resolved to place Athens under a waywode, who, however, held his office from the chief eunuch of the harem. The external affairs of the city were managed by the waywode; a cadi, or judge, decided the controversies between the Ottomans, without interfering in those of the Christians. The garrison on the Acropolis was under the command of the Turkish Disdar. The proper municipal affairs of the city were managed by magistrates elected from the principal families, by the people, and called by the ancient name of archons. They administered nearly all affairs, civil and ecclesiastical, judicial and spiritual, and their decisions were accepted by the people without a murmur. In disputes between Turks and Christians, the archons interposed in the first instance as peacemakers; but if they failed to bring about an adjustment, an appeal lay to the cadi, and from him to the grand vizier. This form of administration remained unchanged from 1470 to 1687. With regard to the condition of Athens during these two centuries, we have but few and brief notices; but it appears to have been not unhappy. In 1570, Zügomalas, a native of Nauplia, in a letter to Martin Kraus (Orusys), a German professor at Tübingen, and author of a work entitled *Turco-Græcia*, says that he has often visited Athens and examined its curiosities; describes the salubrity of the air, and the

excellence of the water; and praises the Athenians as quick-witted, sweet-voiced, and as excelling in music. In another letter, written in 1581, he describes the olive groves watered by the Cephissus and the Ilissus, and yielding a large revenue, by the sale of oil at Constantinople and other cities, to the cultivators. From a letter of Cabasilas, another Greek, it appears that the Acropolis was occupied by Turks, and that the city was chiefly inhabited by Christians, the number of whom amounted to nearly 40,000, many families having left the city at the time of its second capture by the sultan. In A. D. 1675, Athens was visited by Wheeler and Spohn, the former an Englishman and the latter a Frenchman. Both published accounts of their travels, and both represent the condition of the city, and the intelligent character of the inhabitants, on the whole in a favorable light. In A. D. 1687, Morosini, the Venetian admiral, having gained brilliant victories in the war between the republic and Turkey, suddenly appeared in the Piræus. The Athenians seized the opportunity to send a deputation of their chief citizens giving him to understand that they earnestly desired to free themselves from the Turks. The admiral immediately invested the Acropolis, planting his batteries on the Museum, the Pnyx, the Areopagus, and on the eastern side of the Acropolis. The Turks had fortified themselves as well as the suddenness of the attack and their limited means would permit. They had demolished the exquisite little temple of the Wingless Victory, and used the marble blocks in the construction of a bastion below the Propylæa, where they remained undiscovered until 1686. They had deposited a quantity of powder and other munitions of war in the Parthenon. This was made known to the besiegers by a deserter, and an able engineer succeeded, on the night of Sept. 26, in throwing a bomb directly into the magazine, and a formidable explosion immediately followed, causing more damage to that incomparable structure, than time and barbarian ravages had accomplished for 20 centuries. The Turks surrendered on Oct. 4, and were allowed 5 days for their departure with their wives and children. Three thousand went away; but according to Sir Paul Rycault, 300 Turks chose to abjure Moslemism rather than quit Athens, and being baptized, were received into the Catholic Church. Morosini and his officers, together with the Athenians, commemorated the liberation of Athens by religious services, and consecrated the most beautiful church in the city to St. Dionysius the Areopagite, the surrender having taken place on that saint's day. But an epidemic sickness, and a fresh muster of the Turks, compelled Morosini, in a few months, to withdraw from Athens. A large number of the citizens fled with such of their valuables as they could carry with them; some to Salamis, Ægina, and other islands; some to Corinth, some to Nauplia, and others to Cephalonia, where a village now bears the name

of Athenia, still inhabited by their descendants. These events occurred in March, 1688. The city remained deserted until the following year, when the Turks entered it and committed a large part of the houses to the flames. The Athenians, however, began gradually to return. The sultan granted them a free pardon, and remitted the tribute for 8 years. Their condition was eloquently and pathetically described in an address written from Salamis to the patriarch of Constantinople, in 1690. Hardly had the Athenians returned to their native city, when they began to give their attention to education. Gregorius Soteres, afterward metropolitan of Monembasia, established at his own expense a Hellenic school. Johannes Lekas established another, in which he supported 12 pupils at his own expense, having deposited in the treasury of the Venetian republic the requisite funds, which were lost by the downfall of that government, in 1797. Both schools were afterward supported at the public expense, until 1812. From 1690 to 1754, the Athenians lived quietly, under a political organization essentially the same as we have already described. In a memoir written by a distinguished teacher, Johannes Benizelos, and published by Christophoros Perrhaebos, in his history of Souli, it is said, of this period: "Athens, although under the Ottoman yoke, was in a flourishing condition, and might be held up as an example to the other cities of Greece. It was her good fortune to have her affairs wisely administered by honorable citizens, under a kind of aristocracy, bearing the ancient title of archons." He then gives in detail, the mode in which the government was carried on; their relations with the waywode and the sultan; the rates of taxation, and other interesting particulars. Between 1754 and 1777, Athens was frequently harassed by the Albanian incursions. In the latter year, a battle was fought at Calandria, near Athens, by the Athenian Turks and Greeks, under the waywode, named Chassekes, against these barbarians, commanded by the Deli Pasha, and a decisive victory gained. This event put a stop, for the time, to hostile incursions. In 1778 Chassekes fortified Athens with a wall, using materials taken from many of the ancient structures. The conduct of Chassekes gained him so much popularity, that his reappointment was solicited and obtained of the Porte, and finally he was appointed waywode for life. Having secured his end, he threw off the mask, and showed himself to be a grasping and tyrannical man. The tide of popular feeling turned against him, he was banished; but by intrigue and bribery he was again restored. The contest continued 22 years, during which the game was repeated 5 times; and finally, in 1795, he was beheaded in Coa, the place of his exile. In this period the prosperity of Athens declined. Her population and wealth greatly diminished. A pestilence ravaged the city in 1789 and again in 1792. About 1,200 perished in the former, and 1,000 in the latter.—We have

now arrived at the period, when the movements for national regeneration commenced among the Greeks. Toward the end of the last century and the beginning of the present, a remarkable revival took place in the intellectual energies of the Greeks. Members of Fanariot families at Constantinople, wealthy merchants in the principal cities of Europe—the Rhalles and Zosimades—helped by their liberal contributions the growing ardor of the Hellenic race, for reform and education. Literature lent its aid to the kindling enthusiasm. The lyric songs of Rhaegas, the Thessalian, thrilled the heart of the nation; and the elegant and animated appeals of Coraës to the glorious memories of the past history, and to the noblest sentiment of patriotism, nerved his countrymen to dare every extremity of fortune to regain their long-lost independence. Athens shared in the general excitement. The society called the *Hetaria*, embraced the leading Greeks wherever found. New schools were established at Athens, at the expense of patriotic citizens, and young men were sent to the universities of western Europe. Among the distinguished Athenians belonging to this period, may be enumerated Benizelos, the distinguished teacher, whose memoir on Athens has been already referred to, and who died in 1806; Koubelanos, teacher, d. 1812; Marmarotoures, teacher, d. 1817; Logothetes, magistrate, d. 1818; Triantophylles, ecclesiastic, d. 1821 (beheaded by the Turks); Rebelakos, d. 1821; Philippides, d. 1821; Katzandres, d. 1821; Kapetanakes, magistrate, d. 1822; Ohomatianos, English consul, d. 1822; Danea, bishop of Edessa, d. 1822; Masson, d. 1823; Skouzes, d. 1823; Petrakes, teacher, d. 1823; Kodrikas, d. at Paris, 1827; Zographos, d. 1828; Angelides, d. 1829; Staoros, Marmarotoures, d. 1832; Galanos, d. in India, 1833. Many distinguished men of Athens who took part in the national movements, are still alive, and in various departments of the public service. The war of independence commenced in 1821. The fortunes of Athens were variously affected during the 7 years of its continuance. The insurrection having commenced elsewhere, reached Attica in a few weeks. The Turks retreated to the Acropolis, the city was taken possession of, the standard of liberty was raised April 28, 1821, and the garrison was closely besieged. Several tragical scenes were enacted in the following months. The garrison was relieved July 20, and the Greek troops compelled to retreat, by the Turks, under Omer Pasha, Brionas, and Omer Bey. Many of the inhabitants were slain, and the city ravaged, plundered, and burned. Many of the Athenians fled to Salamis and Ægina, and some of them joined the troops concentrating at the isthmus of Corinth. In Sept. 1821, Omer Pasha retired from Athens with the greater part of his forces, and his Deli Pasha, soon afterward, with the remainder. The Acropolis was again left in the hands of the resident Turks, and the Athenians, returning from their places of refuge, besieged them. The Turks had collected large

supplies of provisions. A good deal of hard fighting took place between the besiegers and the besieged. The Turks having undergone the most terrible sufferings, chiefly from want of water, finally surrendered, and the Greeks planted their standard on the Acropolis, June 10, 1822. The number of Turks who capitulated was 1,160. Before they could be conveyed to a place of safety, unfortunately for the good name of the Greeks, a rumor of a new invasion spread through the city, and caused such alarm that they fell upon the Turks, and put to death about 400, in violation of the terms of the surrender. Some perished by an epidemic disease, and finally only 550 were transported safely to Asia Minor. Meantime dissensions broke out among the leaders at Athens, and Ypselantes, Niketas, and Odysseus, called in by the contending parties, arrived at Athens in August. As they were of one mind upon the matter, Odysseus was allowed to dispose of the command of the garrison to his subordinate Gouras, he himself having been made military dictator of eastern Greece. On Feb. 16, 1823, the city of Athens was enlivened by the festivities in honor of the marriage of Gouras with the daughter of a distinguished family of Lidoriki. A popular movement against his government was put down by rigid and severe measures, and a sudden rumor that the Turks were on the march for Athens tended to allay the discontents by a sense of the common danger. Gouras collected in the Acropolis all the provisions he could lay hands on; but the Turks, having killed a few peasants in the neighborhood, taken prisoners a number of women, and gathered the ripening grapes in the vineyards, withdrew from Attica. In 1824 Odysseus entered into traitorous compact with the enemy, and commenced a series of hostile demonstrations against Athens. Gouras, commandant of Athens, was sent against him, and gained a victory. Odysseus, perhaps already repenting the rash step he had taken, and not willing to trust to the fidelity of the Turks, surrendered himself to Gouras. He was sent to Athens and placed in close confinement in the old tower on the right of the Propylæa. On June 18 his mutilated and lifeless body was found below, he having doubtless been put to death with the consent of Gouras himself. Karaiskakes, who had been for some time engaged in brilliant military operations in the north, returned to Athens, early in March, 1827. In the mean time Lord Cochrane had arrived, and Gen. Church had been appointed generalissimo of the Hellenic armies. Early in 1826 the Turkish forces, under Kiutahi Pasha and Omer Pasha, overran Attica. Gouras was appointed commander-in-chief of eastern Greece, and was ordered to advance upon the enemy and not to await their arrival at the gates of Athens. He paid no attention to the orders of government, and by numerous acts of oppression alienated the rural population in the neighborhood; but, though disapproving the acts of their commander, the Greeks in the city remained faithful. Numerous conflicts

occurred in the neighborhood of Athens. On Aug. 3 the Turks forced their way into the city, and the Greeks retired into the Acropolis. As Gouras was now besieged, the government appointed Karaiskakes to his place as commander of eastern Greece. One evening in October, as Gouras was watching the operations of the enemy in one of the outworks, making the rounds, he was struck by a shot from the Turks, and fell instantly dead. His body was brought in silently, and in the morning was buried in front of the Parthenon, after the funeral rites of the Greek church. His wife showed herself, on this occasion, worthy to be the companion of a hero. "Why do you weep?" said she, to the soldiers, as she saw them shedding tears. "You have caused his death by your attempts to desert. If your consciences reproach you as the authors of my widowhood, change your conduct, and do not slay his wife also by desertion." The soldiers, overcome by her words, took an oath upon the Gospel and the picture of Christ to maintain their fidelity to the wife of their commander, and they kept the oath. Shortly afterward all his family perished, with a considerable number of Athenian women, beneath the ruins of a part of the Erechtheum, battered down by the besiegers' artillery. The garrison was reduced to great distress, and several daring attempts were made to relieve them. This is not the place to narrate the thrilling events of the fierce struggles in the plain of Athens. On May 4, Karaiskakes rose from a sick bed, as he heard the firing in a skirmish, sprang upon his horse, and galloped into the midst of the fray. He was borne mortally wounded from the field. He passed the last hours of his life in conversing with the assembled chiefs on the condition of the country. Just before he drew his last breath he said to those around him, among whom were Lord Cochrane and Gen. Church: "My country laid upon me a heavy task. I have fulfilled my duty by 10 months of terrible battles. Nothing remained but my life. This I owed to my country; this I surrender to my country. I am dying; let my fellow-soldiers finish my work; let them save my Athens." On May 6 a bloody and decisive battle was fought. Lord Cochrane boasted that he would dine on the Acropolis; but the boast was vain. The rout of the Greeks was complete. Cochrane and Church were compelled to seek refuge on board their ships. The posts in the neighborhood of Piræus were abandoned, and 1,500 of the flower of the Greek warriors lay upon the field; many of the bravest of the leaders fell; others were taken prisoners, and 240 of them were beheaded by the Turks the following morning. Some ineffectual attempts were afterward made to relieve the garrison. The citadel, however, was compelled to surrender on June 5. More than 2,000 men and 500 women were marched down from the Acropolis, and transported to Salamis, Ægina, and Poros. Thus, after a siege of 11 months, Athens was replaced under Turkish domination. About

3,000 Greeks and as many Turks had perished in the siege. Athens remained in the possession of the Turks long after hostilities had been ended by the intervention of the great powers, and was not restored to the Greeks until 1832. During these last years almost all the modern buildings of the city had been demolished. Scarcely a private dwelling was uninjured, and Athens was a pile of ruins. The noble remains of antiquity shared in the general calamity. The repeated bombardments of the Acropolis left their marks upon the Propylææ, the Parthenon, and the Erechtheum, and to this day the broken edges of the rich brown columns, where the original glimmer of the marble is seen, bear witness to the effects of the cannon balls which did the mischief. Human bones, and rusty balls, and fragments of bomb-shells, are found among the masses of broken marble, with which the surface of the Acropolis is strewn. The American missionaries, Dr. Hill and Dr. King, were among the earliest to plant themselves among the melancholy ruins of the city. They gathered a school of forlorn children and vigorously began to reconstruct the edifice of Christian civilization. Caspo d'Istria, the President of Greece, was assassinated in 1831. On Aug. 8, 1832, Otho, the second son of the king of Bavaria, who had been selected by the great powers, England, France, and Russia, was solemnly proclaimed king at Nauplia. He arrived in February, 1833. The king, only 17 years old when he was chosen, attained his majority, which was fixed at 20, in 1835. In that year the seat of government was transferred from Nauplia to Athens, and from this date recommences the history of Athens as the centre of civilization in that quarter of the world. In 1836 Otho was married to Amelia, a princess of the house of Oldenburg, one of the most beautiful women in Europe. The king and his lovely queen arrived in the Piræus, Feb. 14, 1837. The next day they entered Athens, under triumphal arches, decorated with laurel and myrtle wreaths, by the children of the American missionary school, and amidst the enthusiastic acclamations of the people. The city was rapidly rebuilt, and the population increased. The presence of the court and the foreign embassies, quickly created the appearance of active business and renewing prosperity.— In 1843, Athens was the scene of a remarkable revolution, by which a great political change was effected, without shedding a single drop of blood. The Greeks expected to be governed by a constitutional monarchy. But the treaty which placed Otho on the throne, contained no stipulation upon this point; and it did not enter into the plans of the regency which accompanied the young king, to grant a constitution to the people. On attaining his majority, the king took no step in that direction, but governed the country through a ministry and council of state. The people were disappointed and impatient; and their impatience reached its height in 1848. Gen. Kalerges, then in charge of the troops quartered in Athens, supported also

by the great body of the citizens, surrounded the palace in the night of Sept. 14, and demanded a national assembly for the formation of a constitution. No personal disrespect was shown to the king and queen, but the demand was firmly maintained. At length the ordinances were signed, by the advice of the liberal members of the Council of state, at whose head was Gen. Oburch. A new ministry was appointed, and a national assembly convoked. The troops returned to their barracks, the citizens to their homes; the business of the city was not interrupted for an hour, and the courts sat as if nothing had happened. Not an act of violence dishonored the proceedings. The next night the city was illuminated, and Sept. 15 was added to the national holidays. The king and queen were cheered when they drove out as usual, on the following day. The elections for the national assembly were quietly conducted, and resulted in the choice of the best men throughout the country. It consisted of 225 members. They met Nov. 20, and chose for their president Mr. Panoutsos Notaras, a member from Corinth, who was 107 years old, and 4 vice-presidents, Mavrocordatos, Metaxas, Collettes, and Londo. They immediately commenced their labors, and the constitution which they framed was formally accepted March 16, 1844. This constitution secures all the great political and personal rights of the citizens, the equality of the citizens before the law, religious freedom, freedom of the press, popular instruction at the expense of the state, the inviolability of letters, exemption from arbitrary arrest, trial by jury, the independence of the judiciary. The legislative power is distributed between the king, a house of representatives chosen by the people for 3 years, and a senate appointed by the king for life. The ministers are appointed by the king, but subject to impeachment for malfeasance in office. Many other provisions are embodied in this instrument, which cannot be enumerated in this brief sketch. The country has been governed under this constitution from the time of its adoption to the present. Athens has advanced in wealth and population slowly. The present number of inhabitants is only about 30,000; but it is in a fair way to recover some of its lost prominence among the capitals of the world. Wealthy Greeks are beginning to build handsome houses in the eastern quarter of the town. Wherever the calls of business have placed them, they regard Athens with affection, as the capital of the Hellenic race. In education it would be difficult to find another city which has done so much. It has a system of free schools, well graded and ably taught, with 2 thoroughly organized gymnasia, and an admirable university, with 42 professors and 600 students. It is organized according to the German plan, by the establishment of the faculties of philosophy, law, medicine, and divinity. Nothing can exceed the intellectual ardor of the young men, in the several departments of study.

The lecture rooms are daily crowded. The university library now contains some 90,000 well-selected volumes, although the university itself was established so recently as 1836. The press is as free as that of London or New York. The number of books issued by the publishing houses is unprecedented. The education for girls is amply provided for. Beside the private schools, and the justly celebrated establishment of Dr. Hill, the American missionary, there is an excellent institution called the Parthenagogeion (school for young women), under the general supervision of Madame Manos, a sister of Alexander Mavrocordatos, a lady of the noblest character, as well as the highest social position. It is partly supported by the society of the friends of education (*Εταιρία φιλελευθέρων*), which was established in 1836. The queen is the special patroness of the school. Its leading object is the education of young women to be teachers; but scholars are received for general education. The regular course of study extends through 5 years, embracing history, Christian ethics, ancient and modern Greek, writing, drawing, arithmetic, vocal and instrumental music, domestic economy, and practical arts. During the last 6 months, those who intend to be teachers are instructed in the methods, and trained in the practice of teaching. A diploma is given to those who have passed satisfactorily through all the prescribed examinations. The future teachers are supported at the expense of the society and the government. In return for this, they are under the obligation to teach 4 years, within the kingdom of Greece, in any school to which the minister of instruction may appoint them. If they fail to keep this condition, they must pay at the same rate with the other scholars, sureties having been given when they enter the school. The annual examinations are attended not only by the committee of the society, but by their majesties the king and queen, the members of the cabinet, the professors of the university, the most eminent of the clergy, and other distinguished personages, before whom the chairman announces the result, and distributes the diplomas. Among the professors in the gymnasia and the university, and the teachers in the schools, there are many men and women who would do honor to the profession in any country in the world.—We have already spoken of the admirable Madame Manos. Her associates are excellent and accomplished persons. Among the women who teach in the common schools are many whose self-sacrificing zeal and conscientious devotion are contributing powerfully to the moral and intellectual improvement of the rising generation. Of the professors in the university, we speak from personal knowledge when we say that the venerable Asopios—the friend and contemporary of the German Wolf—expounds Homer with the life and fire of another Nestor. The lectures of Philippos Johannis on moral philosophy are admirable for purity of

style and clearness of method. Alexander Rizos Rangabes, now holding, in addition to his professorship, a position in the cabinet as minister of foreign affairs, discourses upon the fine arts with acuteness, learning, and taste. Manouses lectures eloquently on history, amidst the applauses of a crowded audience. Pericles Argypopoulos, lately also a member of the cabinet, as minister of religion and public instruction, is a most able and distinguished professor of the law. Professor Kontogones, who has already been mentioned in connection with the Parthenagogeion, is profoundly versed in the Hebrew and Greek Scriptures, and draws to his lecture-room numerous and attentive classes. Professor Paparrhagopoulos lectures on the history of the Hellenic race, with elegance and spirit, and is, beside, a writer of classical purity of style. Nor are these the only members of the professional body who are entitled to the admiration and gratitude of their countrymen, but we have no room to mention more. The institutes for education are objects of pride and favor to the Greeks in other countries. Large contributions are made for their support, from all quarters. Half a million of francs have been lately given by a wealthy Greek, to found an academy of arts and sciences. Very recently, another Greek, named Platygenes, a native of Thessaly, bequeathed 200,000 fr.—\$40,000—to the university, and, about the same time, a knife-grinder, who died leaving 600 drachmas—\$100—accumulated from his scanty earnings, bequeathed 100 dr. to the university. The library is constantly receiving gifts from Greeks in other countries, and is rapidly increasing, almost exclusively from these sources. The Greeks are beginning to excel in the fine arts. Hitherto, in modern times, art has not emancipated itself from the mechanical formalism of the Byzantine school, or, to speak more correctly, the school of Mt. Athos. Pictures, painted according to precise directions laid down in a recently discovered manual called *Ἐγχειρίδιον τῆς ζωγραφικῆς*, containing the traditional rules of the art from the 10th and 11th centuries, have constituted the sum and substance of Hellenic Christian art. A school of the arts has been established in Athens, with good promise of success. Prizes for sculpture and painting have been founded by a wealthy citizen, Mr. Contostavlos, known in this country as one of the Greek agents sent by the revolutionary government on the business of the Greek frigates. These prizes are the subject of an annual competition. At the exhibition of 1856, the prize was awarded for subjects selected by the queen: for sculpture, a shepherd; for a picture, a child at prayer. Two brothers, named Phytalis, divided the prize for sculpture, being adjudged by the committee equal in merit. A French artist, a member of the commission, said: "These statues, if exhibited at Paris, would better sustain the cause of Greece than the arguments of your most brilliant defenders." An archæological society has been

established in Athens for many years. It is under the editorial management of Mr. Pittakes, the conservator of antiquities. Many valuable contributions, both in the way of newly discovered facts in archaeology, and original contributions by the scholars of Athens, have appeared in its pages. A society of medicine, and one of natural history, also have been some time in operation, and are doing a good work. A literary periodical, published semi-monthly, bearing the name of the "Pandora," is a very interesting and able magazine, containing original tales, poems, reviews, and the like, and is the organ of many of the most learned men in Athens. Among the remarkable literary institutions of Athens may also be mentioned the annual competition for the prize of poetry, founded 7 years ago by Ambrosios Rhalles, a Greek merchant at Trieste. It is celebrated on April 6 (March 26), the anniversary of the opening of the Greek revolution. After the religious services in the cathedral a brilliant assembly is held in the university to hear the result of the competition. The prize is awarded by a committee of the professors of the university, one of whom reads the report. In 1856 the report was drawn by Philippos Johannis. He gave a sketch of the competitions of previous years, and stated that the number of the pieces offered had regularly increased since the first establishment of the prize. That year there were 14 in all, which the committee divided into 3 classes: 1, good for nothing; 2, respectable; 3, excellent. Of the first class there were 5; of the second, 8; of the third, or excellent, 6. To show the faithful manner in which the duty of examination was performed, it should be said that the discourse of the professor was very elaborate, containing criticisms upon the several pieces, with extracts from them, and occupying more than an hour in the reading. Of the first class he said, "The invention displayed in them is very poor, the arrangement and distribution entirely defective, the conceptions are commonplace, and many of them false. The style is not only low and feeble, but, in 3 of them, full even of grammatical errors." The other pieces are discussed with equal freedom and candor. Last year (1857) 20 pieces were offered, of which 8 were of such excellence that the committee, consisting of 5 professors, were unable to make any distinction between them. One was a satiric poem; another, a poem on the isle of Chios; and the third, a drama in 5 acts, on the story of Maria Doxopatrias, a heroine of the Frankish Period, mentioned in the chronicle of Romania. We think these scenes also quite characteristic of Athens. When the Crimean war broke out it occasioned a lively sensation in the capital. It was impossible for the Greeks of Greece not to sympathize with the movements of the Greeks of Turkey, who thought the long-expected opportunity had come to strike another blow for national independence. The movements in Athens and other parts of Greece were suppressed by an English

and French army of occupation stationed in and around Athens. In Oct. 1854, that terrible scourge, the Asiatic cholera, appeared in Athens and made dreadful ravages among the population. Among the victims was the only surviving son of the "Maid of Athens," a very promising young man of 18, bearing the classical name of Aristoteles. Many hundreds died, and thousands who could escape fled to the villages in the neighborhood and the mountains. As usual, crimes were dreadfully multiplied. The details of the thefts and robberies committed in the midst of suffering and confusion; the extortions of the dealers and monopolizers; the frauds in weights and measures; the adulteration of provisions, bring up in many of its features the terrible picture of the Plague of Athens, drawn in such dark colors by Thucydides. Chrysanthos Konophaos, one of the chief ecclesiastical dignitaries, addressed to the people an earnest exhortation through the public press. It was published in the *Athena* of Dec. 8, and presented a faithful recapitulation of the sins of the people, with urgent warnings to repent and cast themselves on the infinite mercy of God. The same paper contains a vivid description of the scene by an eye-witness. After enumerating the most conspicuous of the victims—professors, physicians, students, clergymen—he says, "The sun himself hangs dimly over the ridge of Hymettus, and the sad sky is overcast with motionless clouds; all nature seems to be in a stupor; not a leaf stirs; a disagreeable and suffocating heat is in the atmosphere; the very birds flee from the place of death. King Otho and Queen Amelia, the ministers of the foreign powers, the public physicians, a few hundred good citizens, alone remain; the rest, sick, dying, or dead. The city of Athens—the capital of the East—appears like another Pompeii, in whose streets men once walked. The shops, magazines, stores, coffee-houses, the very windows of the houses, are closed. . . . The people that still remained alive, with bended knees and flowing tears, prostrated themselves, self-moved, before the thrice-blessed mother of God, and the Kyrie Eleison resounded through the streets. Bowing their faces to the earth with remorse, all cast themselves upon the mercy of the Most High; men, women, young and old, small and great, followed in procession the sacred pictures, chanting the *Kyrie eleison* with tears." Among those who were carried off by this scourge were Mr. Benthyllos, one of the professors in the university, a professor in one of the gymnasia, and Miss Polytime Kouskouras, a much esteemed teacher in a girls' school, who had taught in public schools 17 years. In each of these cases the minister of public instruction sent a letter of condolence to the surviving friends, which was published by authority in the official paper. A grant of money was made from the treasury to the father of Polytime, "as a small token of the gratitude due from the public to those who serve it with zeal." These facts are perhaps sufficient to illustrate the de-

votion to intellectual pursuits which reigns in modern as it did in ancient Athens. At present things have returned to their former state. The ravages of the cholera have been effaced. The army of occupation was withdrawn from Athens after the close of the Crimean war. Robberies have ceased, and the Klephts, who, in the period of confusion, menaced the neighborhood of the city, and made it dangerous to ride to Mt. Pentelicus, have been suppressed.—The visitor to Athens approaches the city either by way of the gulf of Corinth, or coming up from Sunium. He passes near many spots renowned in history and song, whichever route he chooses. The foreland of Sunium is still crowned with the glittering columns of the temple of Sunian Athena. Egina rises picturesquely from the Saronic gulf, and with the solemn ruins of the temple of the Panhellenian Zeus, looks over the blue sea, to the mountains and plain of Attica, to the Acropolis, surmounted by the Erechtheum and the Parthenon. Entering the harbor of Piræus, the remains of the old encircling walls remind the traveller of the days of Themistocles, whose tomb is by the wave-beaten, rocky shore on his right. He lands on the quay, passes rapidly through the streets of the busy town, enters the plain between the massive foundations of the Long Walls, which have elsewhere utterly disappeared, and, with the old olive groves on his left, and the Cephissus murmuring through them, drives in half an hour to Athens. He enters the city, having passed the temple of Theseus, the best preserved of all the remains of antiquity, on his right. Two sources of intense interest immediately open upon his mind—the living Athenian people, their language, institutions, education, personal appearance, manners, and the wonderful monuments still remaining of the genius of the ancient Athenian Demos. As he walks the streets he listens to the Greek language, not spoken as it was in the days of Demosthenes, but still Greek. The signs over the shops are in good Greek. The notices of the Austrian and French steamers at the post office are in good Greek, though the word for steamboat, *ατμοπλοῦν*, would puzzle the orator, should he suddenly return to earth. The newspapers are published in good Greek, though discussing many subjects which the orator never heard of in his lifetime. The constitution is in good Greek: but the freedom of the press—*ελευθερία του τυπου*—would at first convey no intelligible idea to his mind. Over a cigar shop he would read *Καπνοπωλείον*, and wonder what the man could mean by selling smoke. He was a water-drinker, so that even champagne of the first quality—*Σαμπάνια της πρώτης ποιότητος*—advertised on the opposite side of the street, would not entice him by its sparkle. He would recognize the *κουρείον*, the barber's shop—the centre of gossip and news as in ancient times. The churches, with their Byzantine architecture, would offend his taste, formed as it was by contemplating the Propylæa, and the Parthenon, to which he used to appeal

in his orations to the people of Athens;—but entering he would hear, in good ancient Greek, the liturgy of a religion, first introduced more than 8 centuries after his death, and he assuredly would find in its impressive lessons much that would be congenial to his own magnanimous spirit, and much that strikes a deeper note than even his master Plato ever sounded. He would enter the senate or the chamber of deputies. Most of the legislative discussions would be intelligible to him; but one topic would surprise him—a public loan negotiated through the *ἐθνικὴ τραπεζα*—the national bank. Stepping into the gymnasium, he might hear his own oration on the "Crown" commented upon in excellent Greek, to classes of bright-eyed Hellenic youth, within a few minutes' walk from the spot where it was delivered; and perhaps he would be able to explain what he meant by burning the *γερρα*. At the *καταστήμα ευρωπαϊκων φορεματων* he would be puzzled at first by the, long-tailed dress-coat, the hat, the cravat, or *λαμοδετης*, which he could only conjecture to be a halter. The titles of civil and ecclesiastical dignitaries would astonish him—*Majesty*, *Μεγαλειότης*—*Excellency*, *Εξοχότης*—*Holiness*, *Οσιότης*—*All-holiness*, *Πανοσιότης*—the *Honorable gentleman*, *Ὁ Επριμος Κυριος*—the *Lady of Honor*, *Ἡ Κυρία της τιμης*. In short, he would find the language substantially the same, but largely applied to ideas wholly new to him. It would take him some time to *orient* himself. But he would find the mountains, sky, the sparkling sea, and the unutterable beauty of the atmosphere, the same. The Agora he would find a solitude, peopled with mighty memories. Wandering up the Pnyx, that too would be solitary; but there is the place of the assemblies—there stands the immortal rock—the Bema—from which he and his great predecessors addressed the Athenian Demos. Had he chanced to go thither, on Dec. 21, the queen's birthday, in 1853, he would have found a multitude of citizens, in holiday attire, standing in the Pnyx, and listening to a learned Greek, who discoursed from the steps of the Bema in good ancient Greek, upon the preëminence of the Greek language, and of the old masters. Not one word of this would have been strange to Demosthenes. We have called up the august shade in order to illustrate briefly the changes that the language has undergone during 20 centuries, in his native city, and its identity. In another part of this article we have alluded, with more or less minuteness, to the principal structures in Athens, which were the wonder of the world in ancient times, and which are scarcely less the wonder of the world in their majestic ruins now. Demosthenes said in one of his orations: "Our ancestors were inspired, not by the desire of wealth, but by the love of glory; and therefore they have left us immortal possessions, the memory of illustrious deeds, and the beauty of the works consecrated to them." As he spoke these words he had the temples, porticos, and statues of the agora around him;

above the temple of Wingless Victory—the Propylæa with the broad marble steps, the Doric portico, the fine bronze gates opening through the marble wall, the Athena Promachos, the Parthenon, the Erechtheum, and the marble population of heroes and gods, standing in the open spaces of the Acropolis. Plutarch, 5 centuries later, says: "These works appear, at the present moment, fresh and newly wrought: they seem to wear the bloom of perpetual youth, its glow untouched by time, as if they breathed the breath of immortality, and had a soul that age could never reach." We have room only for a few remarks on the present condition of some of these ancient monuments. The soil of Athens is full of fragments of statues, columns, and other works of the ancients. Bits of the marble seats of the stadium are easily found in the rubbish below. At the S. E. angle of the Acropolis, the outline of the Dionysiac theatre, and some of the seats hewn in the solid rock, together with portions of the massive foundations on which the stage-building rested, may easily be traced. Fragments of a choragic monument bearing the name of Thrasylus, and dating 380 B. C., lie about the upper part of the concave, where an ancient cavern, once sacred to Bacchus, and now dedicated to the Panagia Speliotissa, reminds one at once of the classic and the Christian times. Numerous fragments of ancient marbles are embedded in the walls of the churches, and by the contrast of their style to the rest of the building produce a strange effect. The surface of the Acropolis is thickly strewn with pieces of marble blocks, columns, statues, and votive alabs; and in the left hand apartment of the Propylæa, the ancient Pinacotheca, a picture gallery, Mr. Pittakes has accumulated a large number of every species of fragment, but especially slabs with inscriptions belonging to every age, and many of them of historical importance. The Theseum is used as a museum of ancient sculptures. Many monumental *stelæ* of the most interesting character, with beautiful groups in low relief, and touching funereal inscriptions, are collected there. But the most curious and important marbles, are a series of slabs, found (in 1834) in the Piræus, containing records of the Athenian navy; lists of ships with their names; inventories of rigging and furniture; names of shipbuilders; names of statesmen, such as Demades and Demosthenes, who were connected with the navy department; and numerous other interesting and valuable particulars. These inscriptions are very clearly cut, and, except where the marble has been broken, easily read; and they cover a considerable period of the public life of Demosthenes. The temple of Theseus, as we have already stated, is one of the best preserved buildings in Greece. It is of the Doric order, 104 feet in length by 45 in breadth. It has 6 columns at each end, and 18 on each side, of 3 feet 4 inches in diameter, and 19 feet high. From the stylobate to the upper angle of the

pediment, the height is 81 feet. The sculptures on the pediments are all lost. Those in the metopes are supposed to relate to the labors of Hercules and Theseus. Of the vast temple of Olympian Zeus, the platform on which it stood, and 16 Corinthian columns, one of which was overthrown in 1852 by a hurricane, are all that remain. The peribolus of the temple was 680 feet long, and 463 broad; the temple itself 854 feet by 171 feet. It had 10 columns on each front, and probably 20 on each flank; the height from the pavement to the top of the capitals, 55½ feet; diameter at the base, 6 feet 4 inches. The statue of the god was of ivory and gold. Near the theatre of Bacchus still stands the choragic monument of Lysicrates, erected on the street of tripods in 335 B. C., to commemorate a musical victory. It is a circular structure, 8 feet in diameter, standing on a square basement, and the whole height about 34 feet. It is the earliest specimen of Corinthian architecture. This exquisite little monument was saved from destruction by having been built into the walls of a monastery: the monastery is now in ruins, and the monument of Lysicrates stands almost complete. The tripod by which it was surmounted is gone, but the inscription on the architrave is still legible. At the south-west angle of the Acropolis stands the theatre, or odeon of Regilla, built by Herodes Atticus. There are important remains of this structure: but the interior is nearly filled with an immense mass of rubbish. Passing over the deserted valley where was the ancient agora, we reach the hill of the Muses, on which is a considerable portion of the monument of Philopappus—a late work, and of no particular interest. Next to this in the north is the hill of the Pnyx—the place of the popular assembly—and the Bema, of which we have already spoken; and over against this rises the Areopagus. But the noblest works of the Athenian architects were on the Acropolis. The ascent is at the western end. The chief buildings of the Periclean age on this citadel were the Propylæa, the Erechtheum, and the Parthenon. The Propylæa served at once as an architectural embellishment, and a military defence of the Acropolis. Among the ancients it was more admired than even the Parthenon, for the skill with which the difficulties of the ground were overcome, and for the grandeur of the general effect. The approach was a flight of 60 marble steps, and was 70 feet broad. At the top of the steps was a portico of 6 fluted Doric columns, 5 feet in diameter, 29 feet high. The side wings, on platforms, 78 feet apart, had 8 Doric columns *in antis*, fronting upon the grand staircase. The north wing contained the Pinacotheca, a hall 85 feet by 30; the hall of the south wing was 27 feet by 16. Behind the Doric hexastyle was a magnificent hall 60 feet broad, 44 feet deep, and 39 high, with a marble ceiling resting on enormous beams, supported by 8 Ionic columns, on each side of the passage. At the east end of

this hall was the wall, through which there were 5 entrances, with doors or gates. The central opening, through which the Panathenaic procession passed, was 13 feet wide, 24 feet high; those next the central area, on each side, 9½ feet wide, and the smallest 5 feet, the height varying in proportion. These gates were the only public entrance into the Acropolis. Within the wall, *i. e.* on the eastern side, was another hall, 19 feet deep, its floor elevated about 4½ feet above the western, and terminated by another Doric portico, of 6 columns. The pediments and ceilings of this admirable structure have been destroyed. Most of the columns remain, some of them entire, and others more or less broken, with heavy fragments of the architraves. Passing through the Propylæa, we come to the Erechtheum, on the left or northern side of the Acropolis, and the Parthenon on the right, near the southern or Cimonian wall. The form of the singular structure first mentioned was oblong, with a portico of 6 Ionic columns at the east end, and a kind of transept at the west, a portico of 4 columns on the north, and the portico of the Caryatides, standing on a basement 8 feet high, on the south. At the western end there is a basement, on which are 4 Ionic columns half engaged in the wall, and supporting a pediment. The eastern and western divisions of the temple are on different levels, the eastern being 98 feet higher than the western. Enough remains of this extraordinary and beautiful temple, to give a perfectly correct idea of its outward form; but the interior is in so ruinous a condition that the distribution and arrangement of the division are subject to the greatest doubt. The numerous antiquarian questions which suggest themselves here, cannot be discussed in this place.—We come now to the Parthenon, the noblest monument in Athens, and the world. The contrast between this temple and the Erechtheum is strikingly beautiful. We have already incidentally alluded to the principal points in its history, and the various fortunes in which it has shared. It was built of Pentelic marble, under the superintendence of Phidias, by Ictinus and Callicrates. It stands on a basis approached by 8 steps, each 1 foot 9 inches high, 2 feet and about 4 inches wide. Its breadth, on the upper step, is 101.88 feet; its length 228 feet; the height to the top of the pediment from the upper step of the stylobate, 59 feet, and with the stylobate, 64 feet. The temple is Doric, octostyle, or with 8 columns at each end, and peripteral, or colonnaded all round, there being 15 columns each side, not counting those at the corners—46 in all. The length of the *στυλος*, or body of the temple, is 198 feet, and its breadth 71 feet, omitting fractions. The space between the peristyle and the wall is 9 feet wide at the sides, and 11 feet at the fronts. The body is divided by a transverse wall into 2 unequal portions; the eastern was the *naos* proper, an apartment for the statue of the goddess, 98 feet in length; the western, the *opisthodomos*, which was commonly used as the

treasury of the city, 48 feet long. Within the peristyle, at each end, were 8 columns, 38 feet high, on a stylobate of 2 steps. Within the *naos*, was a range of 10 Doric columns on each side, and 8 at the west end, forming 3 sides of a quadrangle; above them, an architrave supported an upper range of columns, which Wheeler, at the time of whose visit they were still standing, calls a kind of gallery; 14 feet distant from the western columns is the pavement of Piraic stone, on which the great chryselephantine statue of Athena was placed. Beside the internal decorations, the outside of the temple was ornamented with three classes of sculpture: 1. The sculptures of the pediments, being independent statues resting upon the deep cornice. The subject of those on the eastern pediment was the birth of Athena; of those on the western, the contest between Poseidon and Athena, for the possession of Attica. 2. The groups in the metopes, 92 in number, representing combats of Hercules and Theseus, the Centaurs and Amazons, and perhaps some figures of the Persian war. These groups were executed in high relief. 3. The frieze round the upper border of the cella of the Parthenon contained a representation in low relief of the Panathenaic procession. All these classes of sculpture were in the highest style of the art, executed by Phidias himself, or under his immediate direction. Most of them were in place when Wheeler visited Athens, in 1876; and drawings of the figures in the pediments were made in 1874, by Carrey, a French architect, in the suite of the Marquis de Nointel, minister of France at the Porte. The interior of the temple was thrown down in 1687, by the explosion of a bomb in the Turkish powder magazine, as has already been stated. The front columns of the peristyle escaped, but 8 on the north side, and 6 on the south, were overthrown. Morosini, in endeavoring to remove some of the figures on the pediments, broke them, and otherwise did great mischief. At the beginning of the present century, Lord Elgin dismantled a considerable part of the Parthenon of the remaining sculptures, which form the most precious treasures of the British museum, at the present moment. A question has been much discussed, as to whether any portion of the exterior of the temple was decorated with painting. It is hardly possible to doubt the fact, after a personal examination. Many of the mouldings have traces of beautifully drawn patterns. Under the cornices, there are delicate tints of blue and red; and of blue in the triglyphs. Architraves and broader surfaces were tinged with ochre. All these figures were executed so delicately and exquisitely, that it is impossible to accept the theory sometimes advanced, of their being the work of subsequent barbarous ages. There are other traces of colors on the inner surface of the portion of the walls still standing, which evidently belong to a period after the stonecutters, Eulogius and Apollon, converted the Parthenon into a church. Among the inscriptions there is one,

found in 1836, containing a record of money paid for polychromatic decorations. The Parthenon was built in the best period of architecture, and under the inspiration of the highest genius in art; and the best attainments of science were combined in producing its exquisite perfections. The pathetic beauty of its decay is indescribable. The impression it makes is that of a solemn and wondrous harmony. Its aspect is simple, but scientific investigation has not yet exhausted its beauties and refinements. The combination of the most delicate architectural proportions, with the sculptural compositions, of which enough in each class remains, after all the ruin wrought by time, and war, and barbarism, to give us a lively idea of their admirable execution; the variety of these compositions, differing in character and size according to their position and subjects, but all relating to a central idea which harmonizes them, must have been magnificent beyond description, when the temple first stood in its fresh glory, under the sky of Attica. But delicacies of construction have not ceased to be discovered in this wonderful building. In 1837, Pennethorne, an English traveller, noticed the inclination of the columns. Hofer, Schubart, and others, have examined the subject, and published their observations upon the inclination of the columns, and the curved lines of the stylobate and architraves. Mr. Penrose, an English scholar and architect, visited Athens in 1845, and was afterward sent by the society of dilettanti to complete the investigations he had already commenced. The results were published in a splendid folio, 1851. They may be briefly summed up thus: The lines which in ordinary architecture are straight, in the Doric temples at Athens are delicate curves. The edges of the steps, and the lines of the entablatures, are convex curves, lying in vertical planes, and nearly parallel, and the curves are conic sections, the middle of the stylobate rising several inches above the extremities. The external lines of the columns are curved also, forming a hyperbolic entasis. The axis of the columns incline inward, so that opposite pairs, if produced sufficiently far, would meet. The spaces of the inter-columniations, and the size of the capitals, vary slightly, according to their position. From the usual points of view, these variations and curves are not perceptible, but they produce by their combination the effect of perfect harmony and regularity, and the absence of these refinements is the cause of the universal failure of buildings constructed in modern times, according to what have been supposed to be the principles of Hellenic architecture. This subject is treated by Mr. Penrose in greater detail, and with remarkable precision; also by M. Boulé, in a learned work, entitled *L'acropole d'Athènes*, Paris, 1853-'55.

ATHENS, a county in the S. E. part of Ohio, on the Ohio river. It has an extremely fertile soil, and is well wooded, and watered by the Hockhocking. It abounds in iron ore and coal, and large quantities of salt are manufactured

throughout the county. The Hocking canal extends from the centre of the county to the Ohio canal. In 1850 the productions were 448,546 bushels of Indian corn, 72,146 of wheat, 92,990 pounds of wool, 257,802 of butter, and 12,188 tons of hay. There were 24 churches, 1 newspaper office, and 3,986 pupils attending public schools. Pop. 18,215.

ATHENS, a prosperous town of Clarke county, Georgia, situated on the Oconee river at the northern end of the Athens branch railroad, is the centre of a large cotton growing region, has a cotton manufactory of large capacity, while within a few miles there are 3 others. It contains Franklin college, a number of churches, a bank, and 5 newspapers. Pop. 3,700.

ATHERSTONE, a market town of England, in the county of Warwick, and about 20 miles N. N. E. of the town of that name. The town consists mainly of one street, and contains an ancient chapel, now much defaced by modern alterations. In August, 1745, Atherstone was the scene of a conference between the Earl of Richmond, afterward Henry VII., whose army was encamped near the old church, and the 2 Stanleys, the result of which was the overthrow of Richard III. at Bosworth Field, 2 days afterward.

ATHERTON, CHARLES G., an American senator, born at Amherst, N. H., July 4, 1804, died Nov. 15, 1853. He graduated at Harvard college in 1822, and was educated to the law, but engaged in politics while yet a young man. For many years he was a member of the N. H. legislature, and for 8 years speaker of the House. He was elected to the federal house of representatives in 1837. On Dec. 11, 1838, being a member of the committee of ways and means, he introduced, under a suspension of the rules, a series of resolutions, declaring that "congress has no jurisdiction over the institution of slavery in the several states of the confederacy;" that "petitions for its abolition in the district of Columbia and the territories are part of a plan for its removal from the states;" that "such agitation is contrary to the spirit of the constitution;" that "the equality of the several states precludes congress from an attempt to act in favor of or against their several institutions;" that "all such attempts being in violation of the constitution," "every petition, memorial, resolution, proposition, or paper, touching or relating in any way or to any extent whatever to slavery, or to the abolition thereof, shall, on the presentation thereof, without any further action thereon, be laid on the table without being debated, printed, or referred." These resolutions were passed, under the previous question, by a vote of 126 to 78. Although not themselves re-introduced they formed the basis of the 31st rule of the next congress, by which all such petitions, upon presentation, were considered as objected to, and the question of their reception laid on the table. The rule was vigorously opposed as contrary to the right of petition,

but was supported on the grounds of public policy, and for the suppression of agitation. It was maintained for several sessions, until 1845, but finally yielded, partly to objections on the ground of principle, partly to the experience of its inefficiency. Mr. Atherton continued in the house of representatives until 1848, when he was elected to the senate, where he remained until 1849. He was again elected in 1852. He acted steadily with the democratic party, and was considered at the time of his death as the wealthiest citizen of New Hampshire.

ATHERTON, CHARLES HUMPHREY, father of the preceding, born at Amherst, N. H., Aug. 14, 1778, died Jan. 8, 1858, graduated at Harvard college in 1794. He was a representative in congress from 1815 to 1817, and held the office of register of probate for 39 years, from 1798 to 1837. He was for many years at the head of the bar in Hillsborough county, and contributed many valuable papers to the history of his native state.

ATHERTON, HUMPHREY, a military officer, whose name is mentioned with much honor in the early annals of Massachusetts. He came from England about 1686, when he signed the covenant of the church at Dorchester. He was admitted as a freeman in 1688, and was deputy in the general court from Dorchester for that year, and also in 1689, '41, and in '53, from Springfield, when he was chosen speaker. The next year he was chosen assistant, and soon after major-general. He was much employed in negotiations with the Indians, and made use of his influence with them in a great purchase in the colony of Rhode Island. He died by a fall from his horse at Boston, Sept. 17, 1661. The manner of his death is made matter of comment by Hubbard as one of the judgments of God.

ATHIAS, EMANUEL BEN JOSEPH, a Jewish rabbi, a printer in Amsterdam in the 17th century, principally noted for having published 2 editions of the old Testament in Hebrew in 1661 and 1667, valuable for their correctness, and on which are founded most of the modern editions. They are remarkable for being the first in which the verses were marked with Arabic figures. So much satisfaction did these improvements give to the government of Holland, that the states-general conferred upon Athias a chain of gold and a medal.

ATHLETÆ (Gr. ἀθλα, prizes), a name applied by the Greeks and Romans to persons who contended, in contests of strength or agility, for honor and pecuniary or other rewards. In the early periods of Greek civilization, we do not hear of professional combatants, those who contended at the Olympic, Nemean, and other public games, being amateurs; but afterward a profession of athletes gradually formed itself. These athletes who conquered at any of the great national festivals of Hellas were received in their native states, and even beyond their limits, with uncommon honors. A breach was

made in the walls of the victor's native city for his reception; he passed through the streets, in a chariot drawn by 4 white horses, to the temple of the guardian deity of the state, where a solemn service was celebrated. His statue was set up in the market-place, he was relieved from the payment of taxes, and enjoyed a seat of honor on all public occasions. The great national festivals at which such honors might be won, were, for a long time, exclusively the Olympic, Isthmian, Nemean, and Pythian. At Athens such victors, according to a law of Solon, received a prize of 500 drachmæ for an Olympic crown, and 100 drachmæ for a crown won at the other 3 games. At Sparta they fought near the king's person. Athletes were first introduced into Rome by Marcus Fulvius, at the conclusion of the Ætolian war, 186 B. C. Nero was passionately fond of the Greek athletes. At Rome they formed a college, which enjoyed certain privileges, including immunity from taxes. The athletes were trained by professional trainers. Their food, according to the early writers, consisted of dried figs, weak cheese, and vegetables; later it was the very reverse, and approximated more to that used by English prize-fighters, namely, a generous quantity of animal food, with a very small allowance of coarse unleavened bread. They had a minimum of food, under which they might not eat. This minimum was so large that they used to fall into a feverish sleep after it, like an overgorged boa-constrictor. While under training, wine and women were strictly forbidden. Their place of exercise was called the *palæstra*. Here and in the public arena they appeared naked, though in the Iliad they are represented as being girded about the loins. They were anointed with oil, with a view to make the limbs more supple, and prevent the waste of stamina from perspiration. After the contest the athletes were scraped and rubbed by the *aliptæ*, like race-horses by stable boys. The protecting gods of the athletes were Zeus, Hercules, and the Dioscuri.

ATHLONE, a market town and parliamentary borough in Ireland, lying on both sides of the river Shannon, partly in Westmeath, and partly in Roscommon, 76 miles W. from Dublin. Pop. in 1851, 6,218. The opposite shores of the river are here united by a handsome bridge, constructed in 1844, and a canal has been formed to avoid the rapids at this point, thus making navigation practicable for 71 miles higher up the stream. The castle occupies an eminence on the right bank of the river, and with its outworks covers a space of 15 acres. It was strongly fortified during the last war with France, and now contains 2 magazines, an ordnance store, an armory with 15,000 stand of arms, and barracks for 1,500 troops. After the battle of the Boyne, William III. besieged Athlone unsuccessfully, but it was taken by Gen. Ginkell in the following year. The town has 2 churches of the establishment, 2 Catholic chapels, and several dissenting meet-

ing-houses. It has a distillery, a brewery, and a tannery. An active trade is carried on by steamers with Limerick and Shannon harbor, and with Dublin by the grand and royal canals.

ATHOL, *ATHOLK*, or *ATHOLL*, a district in the northern part of Perthshire, Scotland. It is about 45 miles in length, by 80 in breadth, and is picturesque and mountainous, some of the summits attaining an elevation of more than 3,000 feet. It contains several lakes, and beautiful valleys, among which is the pass of Killecrankie, where Grahame of Claverhouse gained a victory, and met his death, July 17, 1689. Agriculture is carried on in the valleys, while on the hills sheep and cattle are pastured. The duke of Athol receives his title from this district, where he possesses extensive estates, on which a large number of red deer, with which the country was formerly well stocked, are still kept.

ATHOS. At the north-western extremity of the *Ægean* Archipelago, that sea is indented by a large peninsula, itself ending in 3 remarkable smaller peninsulas. The most easterly of the 3 is the peninsula of Athos, about 40 miles long and 4 broad, and with a trend due N. E., and included in the present Turkish province of Salonica. The peninsula of Athos is mountainous, and cut by numerous ravines. At the foot or extremity of the peninsula stands the mountain which has given it its name. Mt. Athos is about 6,800 feet in height, with a peak of white limestone, while its lower rocks are of gneiss and argillaceous slate. It has altogether a unique situation, and has therefore been an object of interest both to ancients and moderns. The Christians early regarded it with religious veneration, and built upon it many chapels and places of devotion, some of which may be dated back as early as the time of Constantine. The monasteries of this mountain are 20 in number, and some of them are surrounded by high turrets. They have been the depositories, in several instances, of very valuable libraries, the well-preserved treasures of which have made important additions, within the last century, to our Greek classic literature. The number of monks in these convents is estimated at 8,000. The mountain, and, indeed, the entire peninsula, is called the Holy mountain. No female, not even of animals, is permitted to enter the peninsula. The monks devote themselves to a life of the most rigid asceticism. The scenery of the mountain and adjacent country is picturesque in the extreme. The sides of the mountain are flanked with vast forests of pines, oaks, and chestnuts, the pines growing to an immense size. The shores of the cape are so bluff and precipitous that 80 rods from shore gives 100 fathoms. It was across the mouth of the peninsula of Athos that Xerxes cut a canal for his ships, in his invasion of Greece. The remains of this canal are still distinctly visible, through most of its extent. Near the middle of its course it is not discernible, probably having

been filled up to allow a more ready land egress and ingress to the peninsula. The canal, according to ancient history, occupied the entire working force of the army 8 years in its construction.

ATHWART, in sea phrase (*Dan. a* and *toert*, transverse), means across the line of a ship's course.—Athwart the bows means at right angles, or nearly so, to the bows.—Athwart-hawse, the situation of a ship when she is driven or drifts across the forepart of another, whether in contact or at a short distance.—Athwart the fore-foot is said of the track of a cannon-ball fired across the onward course of a pursued or signalled ship to bring her to, or to cause her to shorten sail, so that she may be examined.

ATITLAN, the name of a town, lake, and volcano, of Central America, 80 miles N. W. of Guatemala. The lake is 24 miles long, and 10 wide. The town, Santiago de Atitlan, is situated on its south side. The height of the volcano is 12,500 feet.

ATKINSON, THEODORE, an eminent citizen of New Hampshire, born at Newcastle, Dec. 20, 1697, died in 1779, graduated at Harvard university in 1718, was afterward several times in actual service during the war with the French and Indians, and was appointed one of the commissioners sent to Canada for the release of prisoners. He held at various times the offices of clerk of the court of common pleas, collector, naval officer, and sheriff of the province; he was also appointed delegate to the congress at Albany in 1754, and the same year chief justice of the state. The revolution deprived him of office. Mr. Atkinson left a legacy of £200 to the Episcopal church of Portsmouth, the interest of which was to be expended in bread for distribution each Sunday.

ATKYNs, SIR ROBERT, born in 1621, died in 1709, son of Sir Edward Atkyns, who was an English judge during the commonwealth, and the reign of Charles II., and died in 1669, aged 82. Sir Robert, educated at Oxford, was called to the bar in 1645, made a knight of the Bath at the coronation of Charles II., in 1661, and soon after elected member of parliament for East Looe, for which borough he continued to sit until 1672, when he was made judge of the court of common pleas. He had previously been recorder of Bristol, and solicitor-general. As a judge, he was learned and impartial, though, on the trial of the parties charged with the popish plot of 1679, he showed himself not free from the prevalent anti-Catholic feeling of the time. Dissatisfied with the public measures and private influences directed against the independence of the judges, he quitted the bench in 1680, it is not known whether by resignation or dismissal. In 1682, having taken part in a civic election at Bristol, said to have been irregularly conducted, he was indicted by the mayor and corporation, to whom he was opposed, and, with two others, tried and convicted at the assizes, for a riot and conspiracy.

The superior court arrested the judgment, upon a flaw in the indictment. Resigning his recordership, Sir Robert retired to his family seat in Gloucestershire, where for some years he took no ostensible part in public business, though elected to the only parliament called by James II. In his retirement, he wrote a powerful legal argument against the king's power to dispense with penal statutes, and aided Lord William Russell, with legal advice, on his trial for high treason in 1688, and, after the flight of James II., published two pamphlets in vindication of Lord William, and in favor of the reversal of his attainder. In 1689, when Sir William Williams was prosecuted for having, as speaker, and by command of the commons, signed the orders to print Dangerfield's narrative of the popish plot, Sir Robert Atkins published a tract showing it was a question of parliamentary jurisdiction, with which the courts of law could not interfere. When William III. made his judicial appointments, in February, 1689, Sir Robert Atkins was appointed chief baron of the exchequer, and in the same year was chosen speaker of the house of lords. In 1694 he finally retired to Sapperton Hall, near Cirencester, where he died at the age of 88. His parliamentary and political tracts were republished in one volume in 1784.

ATLANTA, a city of De Kalb county, Georgia, and a place of great business activity, 101 miles N. W. of Macon, 171 W. of Augusta, and 291 from Nashville. Four lines of railroad, the Georgia road, from Augusta, the Macon and Western, from Macon, the Atlantic and Western, from Chattanooga, Tenn., and the La Grange, from West Point, 72 miles distant, terminate here. It is consequently a depot for the cotton and grain of several of the adjacent counties. Atlanta was laid out in 1845, and has grown very rapidly. It is now one of the largest and most important places in northern Georgia. Its site is elevated, and there is little sickness. It received a city charter in 1847. It has 6 churches, 2 newspapers, and a bank. Population in 1853, about 4,000.

ATLANTIC, a county situated in the S. S. E. part of New Jersey, has about 620 square miles of territory, and 8,961 inhabitants. It was set off from Gloucester county in 1837. The Atlantic ocean borders it on the S. E., where it is indented by Absecon, and several other bays, which are planted with oysters, and other shell-fish. The surface of the county is low and flat; it is marshy near the coast, and the soil further inland light and sandy. The county seat is at Cape May Landing. The productions in 1850 were 68,868 bushels of Indian corn, 16,592 of potatoes, 8,850 of rye, and 9,569 tons of hay. There were 18 churches, and 840 pupils attending public schools. Pop. in 1855, 8,608.

ATLANTIC OCEAN, that part of the great deep lying between the western coast of Europe and Africa and the eastern coasts of America, extending from the Arctic to the Antarctic circle, and including the space between the me-

ridians of Cape Horn and the Cape of Good Hope. The portion north of the equator is called the North Atlantic and that on the south the Ethiopic or South Atlantic. The part which properly may be considered the broadest, that lying between the coasts of Georgia and Africa, is 8,600 miles, or, if we include the Gulf of Mexico, 4,700 in width. The narrowest part, between Cape Frio and the coast of Africa, is 1,530 miles.—The middle portion of the North Atlantic, called the Sea of Saragossa, has been represented as a "stagnant and weedy sea"—"generating on its calm surface what has been well called an oceanic meadow," sufficiently extended to retard the progress of vessels; but this is not so. The belt of calms called the horse latitudes crosses this area, but it is narrow compared with this "weedy sea," which has its currents and breezes. To the improvements which have been made in navigation and in the models of ships, we are indebted for the average time of passage of sailing vessels being shortened.—With the knowledge which we now possess of the routes pursued by sailing vessels in crossing the Atlantic, one cannot but be surprised at the short passage made by Columbus on his first voyage. With no chart to guide him beyond the Canaries, and in vessels poorly equipped, he was 69 days from the bar of Saltez to his land-fall on the western continent, 25 of which he spent in Gomera, one of the Canary Islands. The distance sailed was about 4,000 miles. Columbus hove to at night as a matter of safety, when seeking for land to be discovered, and this same practice was continued until our own times for the same reason. It was the custom for navigators bound for places within the tropics, until chronometers came into common use, to get in the latitude of the place sought well to windward, sufficient to compensate for any error in their dead reckoning, and then run down, as it was called, to the place. We have known frequently a week to be lost in this anxious work, with a fair wind, running in the daytime and lying to the greater part of the night.—Routes. Sailing vessels from the United States to Europe usually take advantage of the Gulf stream. When fairly within it the weather is generally good, but on the edge it is uncertain and squally. The Gulf stream on this route is not properly crossed, but you leave it, on the same side as you entered it, as soon after you pass the meridian of 85° as is expedient. The route by steamers would not be different.—From Europe to North America the most direct route is that of an arc of a great circle, but we cannot follow it in all cases to advantage. In the route to Europe we take advantage of the Gulf stream, which lengthened the distance; on our return we avoid this stream, but go further north to avail ourselves of favorable winds. If bound to any port north of Cape Hatteras, we keep well to the north of our course, which is, until we pass the meridian of 38°, toward Cape Race; when on this meridian we steer more to the south, so as to get on the

parallel of 43° before we are on the meridian of Sable Island, which we must pass to the south, on account of the dangerous fogs, if we are bound to any port south of Halifax. Then we may shape our course so as to avoid the Gulf stream, which, as we advance to the south, increases in its velocity. In seasons when ice is to be expected, our course is more to the south as we approach the Bank of Newfoundland. The usual months for meeting the ice are April, May, and June, but in some years it has been seen as early as February and as late as August. In 1854 it was seen as late as November, in lat. 48°, long. 48° 20' W.; this was, however, north of the route. In 1856 it was seen in every month. What is called the southern passage is recommended by some, in the winter season, as a pleasant route where boisterous weather is not common; but this term is sometimes used in contradistinction to the route north of the Gulf stream, and by others as going as far south as the trade winds. Our impression is that a route passing south of the Azores and island of Bermuda is the true southern passage. This, for vessels bound to ports south of Cape Hatteras, is to be preferred at any season. We once made a passage south of the Azores, crossing the Gulf stream a little north of Cape Hatteras, were blown off the coast, and recrossed the stream, notwithstanding which we arrived in New York several days previous to vessels which sailed with us, or even 10 days before. Our passage was a pleasant one; to those who went north it was otherwise. Steamers from Europe to northern ports take the most direct route, passing near Cape Race. The following table exhibits the average passages of packets, during a period of 8 years, between New York and Liverpool, in days and hours:

Months.	To Liverpool.	To N. York.	Months.	To Liverpool.	To N. York.

The route from ports on the Atlantic coast of North America, for sailing vessels bound to the N. W. part of Cuba or the Gulf of Mexico, is by way of the Hole in the Wall, the southern point of Abaco. If the draught of water does not exceed 12 feet, on passing the Hole in the Wall, the passage is made over the Great Bahama Bank, passing usually to the south of the Orange Keys; but with a greater draught of water, the edge of the bank is followed, passing to the north, around the Great Isaacs, to the lat. of 24° 40'. When you leave the bank, keep on the southern edge of the Gulf stream until you are fairly within the Gulf of Mexico, or until you are enabled to steer for your port. Steamers from New York do not go by way of the Hole in the Wall, but on the N. W. edge of the Little Bahama Bank, coasting the western edge of this and the Great Bahama Bank, to the south of the Orange Keys. The Charleston steamers for Havana take the inside passage, west of the Gulf stream, stopping at Key West. All vessels from the Gulf of Mexico, or ports contiguous thereto, bound either to the Atlantic coasts of America or Europe, pass out through the straits of Florida, and keep within the Gulf stream as far as their destination will justify. Steamers can pass through the Yucatan passage into the Caribbean sea, but it requires a fast-sailing vessel, keeping well to the Cuban shore, to succeed. In the season of northers this passage is frequently chosen by vessels bound to Jamaica. Sailing vessels bound from the Atlantic ports in North America to the Caribbean sea, or to the lesser Antilles, enter the former, or approach the latter, by such of the various passages as will enable them to reach their ports of destination without beating up against the trade winds; and on

their return voyages proceed north, through the most available passage, in order to pass out of the region of these winds, never contending against them if it can be avoided. If from Jamaica or the western part of the Caribbean sea, bound either to Europe or the Atlantic ports of North America, and you cannot pass out of the windward passage, you must go out through the Yucatan passage, and the straits of Florida. Steamers from New York for Aspinwall pass through the Crooked Island passage, and between Cuba and St. Domingo, or Hayti, returning the same way, unless they wish to stop at Havana. The average voyage out is 10 days, stopping at Kingston, and about 8 days on the return. Vessels from Europe to the Gulf of Mexico and Caribbean sea take advantage of the N. E. trade winds, and enter the latter generally between Guadeloupe and Antigua, unless bound to the Spanish main, when they pass between St. Lucia and St. Vincent. On the return voyage, if from the lesser Antilles, the passage between Guadeloupe and Montserrat is to be preferred. The following table gives the average of passages made by sailing vessels to the Gulf of Mexico and Caribbean sea:

New York	to Havana,	12 days;	return, 9 days.
"	to N. Orleans,	15 "	" 18 "
"	to Vera Cruz,	22 "	" 24 "
"	to Carthagena,	17½ "	" 20½ "
Brest	to San Domingo,	46 "	" 50 "
"	to Martinique,	30 "	" 32 "
Havre	to Vera Cruz,	40 "	" 42 "
"	to New York,	35 "	" 32 "
Cádiz	to Havana,	30 "	" 28 "

In sailing from the United States to Rio de Janeiro, until the introduction of lunar observations, and afterward of chronometers, into general use, it was customary for vessels to cross the equator as far to the east as long. 20° W.; but as the means of determining the longitude with accuracy increased, the dread of falling to leeward was not felt, and as vessels crossed more to the westward, shorter passages were made. As early as 1826 they crossed in the longitude of 80°, and as navigators did not conceal their experience, others availed themselves of it. Improvements in the model of ships, and an anxiety to surpass our predecessors, have carried us on to be more adventurous, and some have gone too far west. Shorter passages are more common than formerly, here as elsewhere, and it is arrogant for any one to say that it is owing to any merit of his own. Vessels sailing from the United States to Brazil, from December to June, should endeavor to reach the longitude of 45° W. on an E. S. E. course before hauling to the south, and then a direct course can be made so as to cross the equator in long. 80° W. The N. E. trade winds are variable and irregular, varying from E. N. E. to E. S. E., but after gaining the trade winds keep a southerly course without tacking even if you make a little westing, as you will have no difficulty in regaining your position on the southern limits. In the other months it would not be advisable to get in the

calm latitudes to the eastward of Bermuda, and it may be preferable to go to the south of that island, and go on the tack which will give the most southing. In sailing to the Cape of Good Hope, after crossing the equator steer to the southward until you are on the southern edge of the S. E. trade winds, when as the winds favor you make your course more direct. The projections of the tracks on this route show a resemblance to projection of the currents. If bound into the Indian ocean, avoid the Agulhas current as you approach the cape, by keeping well to the south of it. The return route passes near St. Helena—crossing the equator about 25° W., is as direct as you can make it. If bound to Europe you will continue on a N. N. W. route until you pass the latitude of 80° N. When the winds are more favorable for you on this route you pass to the west of the Azores.—CURRENTS. In treating of the currents we cannot do better than select the following passage from Prof. Bache's paper upon the Gulf stream, read before the American geographical and statistical society, January 27, 1856, as our introduction: "The great part which the heat of the sun plays in disturbing the equilibrium of the surface of our globe, is well understood. Wherever he shines upon the surface, the air resting upon it is set in motion; so that the circle of the sun's illumination, as it advances over the earth, is a circle of disturbance." That a current can be produced solely by a moderate wind of long continuance is shown in our rivers and lakes, where the water is driven so as to show a decrease in the depth to windward; and that with a wind of short duration a heaping up of the waters can take place, we have an instance in Lake Nicaragua. This lake is 90 miles in length, extending W. N. W. and E. S. E., and it was noticed by the buccaneers as having an ebb and flow of the tide; but they did not assign any cause for it. We have noticed toward evening on its N. W. shore a rise of about a foot, and a fall at the same time on the opposite end of about 6 inches. This oscillation is owing entirely to the increased strength of the wind blowing from the eastward in the latter part of the day. Such being the effect on a small body of water in so short a period, what must it be, when the action of the wind is continuous for 4,000 miles, on a surface of water whose motion is unobstructed for that distance? This we cannot answer, as we are almost ignorant of the general laws regulating the motions of water; but we can point out where it is heaped up within the influence of the trade winds in the ocean so that the tides are quite small, and in some places there are no lunar tides, but a tide once in 24 hours, varying but little from a certain time of the day, and showing that in the open sea there are oscillations dependent on the varying force of the wind, or perhaps on land and sea breezes.—The equatorial current, that volume of water moving from east to west on our globe, interrupted by continents, and sending off branches

in other directions again to reunite, may be said to commence or more properly to reappear on the west coast of Africa, south of the equator. The action of the trade winds, which blow constantly between the tropics, is the cause of this current, and without doubt its velocity is increased by the rotation of the earth on its axis; for although the motion of the tidal wave does not require a transfer of water at the same rate, and in no case whatever is equal to it, yet as the summit of the tide is always to the eastward of the place assigned by theory, the figure of the ocean is not that of equilibrium, and as the earth turns on its axis cannot attain it, but will constantly have a disposition toward it, which will cause a perpetual current of the waters. This current at its commencement, is about 160 miles in breadth, and flows northwesterly with a velocity of about 25 or 30 miles in 24 hours. It crosses the equator about the meridian of Greenwich, where it comes in contact with the southern edge of the Guinea current flowing in an opposite direction, and having a higher temperature. Here the current flows westerly, and exhibits the phenomenon of two currents flowing adjacent to each other in opposite directions for nearly 1,000 miles, and having a difference of temperature of about 7° . Flowing onward on both sides of the equator, the volume of this current is constantly increased by the accession from the south Atlantic current; and when it reaches the meridian of 22° W., it is said to send off a branch toward the N. W., probably caused by the tidal wave which is felt as far N. as 20° , or perhaps further. At 30° W. its breadth is estimated by some to be 300 miles, but it is probably much more. Here it divides; the southern branch forming the Brazil current. The main branch of the equatorial current now flows W. N. W., and is known as the Guinea current. In connection with currents produced by the N. E. trades it flows into the Caribbean sea at a velocity varying from 1 to 2 miles per hour, and estimating the diameter in the meridian of 65° at 800 miles, we can form some idea of the volume of water that flows continually toward the Gulf of Mexico, where it is said to form "a reservoir for the Gulf stream." The distance from Cape Catouche to Cape St. Antonio is 105 miles, between which points is the Yucatan passage, through which the water flows into the Gulf of Mexico; with the exception of the counter-currents off Cape St. Antonio, at the rate of from 27 to 50 miles in 24 hours. As the set to the S. E. off this cape does not extend over 25 miles from the shore, it is within limits to assume the diameter of this stream at 75 miles; the direction in which it flows being from W. N. W. to N. It is now that it turns westward, and is said to make the circuit of the Gulf of Mexico. We find it with a decreasing rate setting over the Campeche bank and thence into the bay of Campeche, until it nearly ceases. To the N. of Vera Cruz we again meet this current, flowing N. half a mile an hour. N. N. E.

from Vera Cruz, in lat. 22° , it sets N. E. one mile an hour, and in lat. 27° it is found setting N. N. E. with an increased velocity. As we approach the meridian of the Mississippi it flows more easterly, and beyond that the direction is toward the N. W. coast of Cuba until it divides; a small portion passing to the W. of Cape St. Antonio, and the greater to the eastward, forming the Gulf stream.—The average temperature of the water in the Gulf of Mexico and Caribbean sea is higher than that of the ocean in the same latitudes, or even that of the equatorial current at its commencement; and although a high temperature is owing to the great influx of the heated water from the torrid zone, it is undoubtedly increased by the caloric carried to it from the surrounding country, which is very properly called the *Tierra Caliente*. Many anomalies are met with, both as to the strength and direction of the equatorial current, which may be explained as accurate observations accumulate; we have endeavored to give its general direction and rate of flow, and as the Gulf stream may be considered as its continuation, it is next in order, and we will commence with Dr. Franklin's opinion as to its course: "This stream is probably generated by the great accumulation of water on the eastern coast of America between the tropics, by the trade winds, which constantly blow there. It is known that a large stream of water 10 miles broad and only 8 feet deep, has by a strong wind had its water driven to one side and sustained so as to become 6 feet deep, while the windward side was laid dry. This may give some idea of the quantity heaped up on the American coast, and the reason for its running down in a strong current through the islands into the bay of Mexico, and from thence issuing through the Gulf of Florida, and proceeding along the coast to the banks of Newfoundland, when it turns off toward and runs down through the western islands." At the time Dr. Franklin wrote, we were without the means we now possess of determining the longitude at sea, and but few observations had been made on the currents of the ocean; nevertheless, what he stated as probable is now confirmed. The trade winds do give "the Gulf stream its initial velocity," and although other forces may operate to change its direction after leaving its narrow channel, yet the nothing on our coast is owing entirely to the "heaped up" waters escaping through the straits of Florida. Doctor Franklin appears to have been the first who made the attempt to delineate this stream on a chart for the benefit of navigators. About 1769-70, complaint was made by the board of customs at Boston to the lords of the treasury in London, "that the packets between Falmouth and New York were generally a fortnight longer in their passages than the merchant trips from London to Rhode Island," and proposing instead of New York that for the future they should be ordered to Newport. Dr. Franklin being then connected with the American Post-

office, was consulted on the occasion. He could not understand why there should be such a difference, especially as merchant ships were more deeply laden than packets, and the distance from London was greater than from Falmouth; and thinking there must be some mistake or misrepresentation, he communicated the affair to a Nantucket captain of his acquaintance, who told him "he believed the fact to be true, but the difference was owing to this, that the Rhode Island captains were acquainted with the Gulf stream, while those of the English packets were not; that they had spoken them when they were in the stream, and informed them that they were stemming a current that was against them to the value of 8 miles an hour, and advised them to cross and get out of it; but they were too wise to be counselled by simple American fishermen." At Dr. Franklin's request, he marked out this current. It was engraved and sent to the captains of the packets, who alighted it. Dr. Franklin observed that the water of the stream was warmer than that of the ocean on either side of it, and introduced the use of the thermometer in navigation, and so great was the interest taken in it by Col. Jonathan Williams, that he published a treatise on thermometrical navigation. The use of this instrument in ascertaining when the Gulf stream was crossed, and as an auxiliary in determining the position of the vessel, was of great importance, until chronometers came into general use. The importance of a systematic examination into the temperature, direction, velocity, and other peculiarities of this stream, determined Prof. Bache, superintendent of the U. S. coast survey, to direct the attention of the officers of the hydrographic parties to it. Their results are exceedingly interesting, and when reduced to form, will be published. In the mean time, we are indebted to Prof. Bache for the information furnished in his reports, and in the paper referred to in our introduction. The duty of these officers was arduous and hazardous. Lieutenant-commanding Geo. M. Bache was swept from the deck of his vessel, with 10 of his men, and lost. To him we owe the discovery of the "cold wall" on the inner side, and the "intensive cold water in the midst of the hot water of the Gulf stream." It is not settled as to where the beginning of the Gulf stream is. They say, "it has its origin in the Gulf of Mexico." South of the Tortugas, the stream flows to the eastward, gradually increasing its velocity as it moves on. Opposite Havana, where its diameter is about 70 miles, its rate is 3 miles an hour, in the centre, decreasing on each side; N. W. from Elbow Key, where the diameter is about 47 miles, the set, in the centre, is N. E. 8 miles an hour, with an increased rate toward the Florida reefs. The stream now bends to the northward, and in the straits between Cape Florida and the Bemini islands its velocity varies from 8 to 5 miles an hour. This is the narrowest part of the

stream, it being only 25 miles in width, and here the maximum temperature is 85°. The mean temperature may perhaps exceed that of the Gulf of Mexico, as the warm waters of the latter would naturally be collected together at the surface, as the passage becomes narrow. The examination of this section by Lieut. commanding Craven, U. S. N., on coast survey service, makes it exceedingly interesting. He found no greater depth than 870 fathoms there, also a temperature of 85° at that depth, showing the existence of a polar current as far south as lat. 25½° N. The "cold wall," in this section, is within 10 miles of the shore. Passing the straits, the axis of the stream has a northerly set, until it passes Cape Canaveral, when it bends gradually to the eastward, running somewhat parallel with the general direction of the coast, but as it approaches Cape Hatteras, it bends so as to flow within 50 miles of the cape, nearly N. N. E., at about 2 miles per hour, after which it turns easterly, and in lat. 38° it runs with a velocity of between 1 and 2 miles an hour. The western edge of the stream bends well into the bight north of Cape Canaveral, and runs within a short distance of Cape Hatteras, when it again recedes from the axis. The bending of the axis and stream here is probably owing to the progress of the tidal wave. As this stream comes out from the straits it has a blue tinge, which can be traced for upward of 100 miles. The separation can easily be seen by the eye between it and the waters of the Atlantic. The temperature, although above that of the ocean at all seasons, in the winter is 20° and sometimes 80° above that of the waters of the ocean between Cape Hatteras and the Grand Bank of Newfoundland. Cooling, as it flows easterly, it has a high temperature when it turns to the southward. The examination of the Gulf stream by the officers of the coast survey has not extended beyond the section S. E. of Nantucket, by Lieut. commanding Davis in 1845. The subjoined table exhibits the distance on each section of the "cold wall" from the shore, and the width of the several bands of warm and cold water measured on the lines of the sections:

Section.	Distance of cold wall from shore.	First Maximum, or Hot Band.	Second Minimum, or Cold Band.	Second Maximum, or Warm Band.	Width of the three Bands of Gulf Stream.	Third Minimum.	Third Maximum.	Fourth Minimum.

								Indefinite.

"They present a width of Gulf stream proper

of from 25 miles at Cape Florida, to 150 miles at Sandy Hook; and of warm water (at, say 15 fathoms) of from 80 to 300 miles wide. These principal divisions of the Gulf stream as we pass southward, increase in their definiteness, and are limited to smaller spaces." The axis is the warmer, and the temperature falls gradually on the outside, but rapidly toward the "cold wall." From the discoveries of Lieut. Maffit and Craven, the cold bands appear to be produced by the shape of the bottom of the sea. In the sections of Charleston and Cape Canaveral, they found two ridges or ranges of hills running parallel with the coast, and it is nearly over the top of these that the first and second cold bands were found. One of these ranges has been traced as far north as Cape Lookout by Commander Sands, U. S. N., on coast survey service. The discovery of the cold bands, and also of the cause of their existence, was so unexpected that it is puerile for any one to say, "I predicted it would be so years ago." The connection between them is this: the polar current flowing toward the equator under the warm water will, by the increasing rotative velocity of the earth's surface, have a tendency westward, and being resisted by inequalities at the bottom, will be forced upward toward the surface, hence these bands and the "cold wall." In the former it is only a change in the temperature and velocity of the stream, while in the latter the polar current shows itself on the surface, its course being regulated by the general direction of the slopes with which it comes in contact, and it will confine the warm water flowing in a contrary direction firmly below, but allowing it at times to overlie it.—For the continuation of the Gulf stream to the eastward of the coast survey examination we are in want of definite information. Rennell's investigation of the currents of the Atlantic ocean, published in 1832, which were mostly confined to the surface, is the best we have. The northern edge crosses the southern part of the Bank of Newfoundland, in about lat. 43° N. in the month of May, and later in the season about 2° further north.—The productions of the tropics have been floated to the shores of Norway, and the western coasts of the British isles; while the warm temperature of the water is traced from the Gulf stream to the N. W. coast of Europe, showing that a large branch passes to the N. E. from the main stream eastward of the meridian of 40°. What should cause this branching off, unless it is the tidal wave, we cannot say; the cotidal lines are at right angles to this branch in this part of the ocean, and the movement of the wave is in the direction of the stream. The following statement of the loss of 2 ships gives us some information as to the velocity and direction of the current before it reaches the grand bank in the centre of the stream:—"Ship Trade Wind, on the 26th of June, at 11.30 P. M., came in contact with the ship Olympus, and both vessels went down in lat. 41° 30', long. 57°. On the 1st of July,

2.30 P. M., the ship Empire took a sailer from the foremast of the Trade Wind, in lat. 42°, long. 55° 30', showing that the mast had drifted 72 miles on a N. 66° E. true course in 101 hours, making $\frac{72}{101}$ of a knot, nearly, an hour." This course, if continued on the arc of a great circle, would strike the coast of France in the deepest part of the bay of Biscay. In this meridian and in lat. 39°, the set is about east, which course if continued as above would pass between the Madeira and Canary islands. But currents cannot move in great circles unless in the plane of the equator. In the northern hemisphere they will incline to the right hand unless obstructed. There is no obstruction to the main body after it passes the Banks of Newfoundland, and the predominating winds are to the north of west on its northern edge, yet it branches off to the N. E. The main stream can be traced to the Azores on its southerly edge, and it reaches the coasts of France, Spain, and Portugal, so expanded and with so diminished a velocity, that we must resort to the track of bottles thrown into the ocean and afterward picked up to ascertain its course.—These show it to be east, to the north of the Azores, and its effects are shown in an increased velocity as it impinges on the coasts. At Cape Finisterre, where it may be said to divide, the northern part forms the Rennell current, and the southern flows along the coast of Portugal. South of the Azores its direction is more southerly; and although it is said to be lost in the Saragossa sea, we can trace its connection with the African and Guinea currents, which last, with its diameter decreasing and an increased velocity, follows the general direction of the coast into the Bight of Benin, where it expands, turns southerly, and is lost in the equatorial current, as it does not cross the equator. The Guinea current varies its diameter according to the season, as also its velocity. In the latitude of the Cape Verd islands its temperature is below that of the ocean, while to the south in the gulf of Guinea it is higher than that of the equatorial current flowing in contact, and flowing in a contrary direction, and evidently receiving its supply from a cooler region. Its diameter south of Cape Palmas is about 150 miles, and its velocity nearly 2 miles an hour. We have now completed the circuit of the great surface-current of the north Atlantic ocean. Within this circuit we have the Saragossa sea, which so much disturbed the crews of Columbus' vessels on his first voyage. It is not now as Columbus found it, covered with fields of floating weeds—*fucox natans*—but in less profusion they are found scattered in small patches within this space. It was not known for a long while whence this plant originally came, until it was found growing among the Andros islands by Commander Barnett, R. N. The forces which produce this current are: 1, the trade winds; 2, change in the rotative velocity of the earth in the different parallels of latitude; 3, the prevalence of westerly and

northerly winds on the coasts of Portugal and Africa. The change in the direction of the current is owing: 1, to the direction of the coasts against which it impinges; 2, the rotation of the earth on its axis; 3, the progress of the tidal wave; 4, the prevailing winds.—The *Rennell Current*, so called after Major Rennell, who first discovered its course, has an easterly direction off Cape Finisterre, flows along the north coast of Spain and the west coast of France, and may be said to cross the entrance of both the English and Irish channels, sending a branch into the latter. It is variable in its velocity and direction, more particularly as it leaves the Bay of Biscay.—The *Brazil Current*. This we have spoken of as a branch of the equatorial current. It commences about 6° S., and flows along the east coast of South America as far as Cape Frio, when it divides; a small branch flowing on toward Cape Horn, and the main branch turning eastward forms the southern connecting current, or, as it is sometimes called, the cross current of the South Atlantic ocean. This, as it approaches the latitude of the predominating westerly winds, has its velocity increased, and we trace the main body, passing within 150 miles of the Cape of Good Hope, into the Indian Ocean, while a branch turning to the north joins the South Atlantic current.—The *South Atlantic Current*. The Agulhas current flowing continually into the Atlantic ocean, around the Cape of Good Hope, is only one of the branches of the equatorial current of the Indian ocean, and on passing the cape forms the commencement of the South Atlantic current. The temperature at its commencement is higher than that of the Indian ocean, showing that it is not a polar current. This current, in connection with the branch of the southern connecting current, flows along the western coast of Africa until it mixes with the equatorial current. Its general direction is north-westerly, but owing to the prevailing southerly winds along the African coast, a portion of it, called the South African current, follows the direction of the shore to where it blends with the Guinea current, or the commencement of the equatorial current. Both the South African and the Guinea currents are surface currents of moderate depth following the line of the coast; as the winds blow, they meet in the neighborhood of the equator. We have spoken of the surface currents originating in the equatorial regions, and have shown that, both to the north and the south of the equator, circuits are made, by which a portion of the waters are returned from whence they came. It is true that the circumstances are different. There is no reservoir to allow the waters to be heaped up and become heated, or a narrow channel for it to escape in the southern circuit; nevertheless, there is a resemblance.—It has been asked why should not the Gulf stream spread itself out like an immense river, and its waters be immediately lost? We have no im-

mense river, when compared with the volume rushing out through the straits of Florida; but if we had, it would, under the same circumstances, preserve its distinctive character in the ocean in the same manner.—In various parts of the ocean we have surface currents of this class, caused by alternating winds. Our limits will not allow us to treat of them, but they are the most dangerous to navigators of any. We have known them to set for a long period in a particular direction, and then turn, flowing a contrary way. Polar currents are those flowing continually from the polar regions toward the equator, to restore the equilibrium, which is constantly being disturbed by evaporation, changes in the density of the waters, and by the flowing off of the warmer or surface currents.—If the view of Prof. Dove is correct, "that isothermal lines of mean annual temperature enclose one connected space of greatest cold, stretching from Melville island toward Icy Cape, but without reaching the latter, or touching the pole," the cause of the flowing of the Arctic current south, through Davis's straits, and along the east coast of Greenland, as a surface current, is explained, as this neighborhood becomes the area of disturbance in the Arctic circle. The ice, with the waters in contact with it, are of less specific gravity than that below the surface, and the former, as accumulation takes place, driven south by the centrifugal force caused by the earth's diurnal motion, flow out through the most direct channel, viz., Davis's strait, and by the way of the east coast of Greenland. This current flows from the frozen regions, one branch descending along the east coast of Greenland, and the other coming down through Davis's strait, along the coast of Labrador, is improperly called the Hudson Bay current; they unite at the mouth of the straits, forming one current, which flows south, a small branch flowing through the straits of Belle Isle, carrying its waters into and mixing them with those of the gulf of St. Lawrence, while the main stream continues along the coast of Newfoundland, until it comes in contact with the Gulf stream. Here, as a surface current, it flows along the American coast, and as an under current it continues on, carrying into the middle of the stream, itself, immense icebergs, there to be dissolved by the waters coming from the tropics.—The following remarks from the pen of the late Wm. C. Redfield, written in 1837, cannot be improved, even at this date. They were not speculations: "It appears, from observations found on the pages of the Coast Pilot, that immediately contiguous to the borders of the Gulf stream, on the coast of the United States, a moderate current is generally found setting to the southward and westward, or in the direction which is opposite to the stream and parallel to the American coast. By a familiar association, this is usually called an eddy current; but we shall probably find, on more particular inquiry, that it has little or no claim to this character.

An eddy, as is well known, is usually caused by some fixed obstacle opposed to a stream, and exhibits a rotary movement. It also derives its waters from the parent stream, and necessarily partakes of the same temperature. I must, therefore, dissent from the views of those persons who refer this current to the eddying action of the Gulf stream, for the following reasons: 1. Because in open sea it nowhere assumes the *form* of an eddy; but, when unobstructed by violent winds, pursues its course toward the south-west parallel to the general direction of the coast. 2. Because, on the edge of the Gulf stream on this coast, there are no obstacles presented which could divert the progress of a portion of the stream, or circumscribe the same in eddies. 3. Because, if this current was derived from the Gulf stream, it must necessarily partake of its temperature as above suggested; but the sudden reduction of temperature on leaving the margin of the Gulf stream is most remarkable, and is almost unparalleled, except in the immediate vicinity of ice. We shall in vain attempt to explain this extraordinary change of temperature by the proximity of shallows or soundings, for this cannot avail if the water itself be derived from the Gulf stream, to say nothing here of the general unsoundness of this explanation. I have long since become satisfied that the current in question is neither more nor less than a direct continuation of the Polar or Labrador current, which bears southward the great stream of drift ice from Davis's strait, and which, in its progress to the lower latitudes, is kept in constant proximity to the American coast by the same dynamical law or influence which in northern hemispheres causes all currents which pass in a southerly direction to incline to the westward, in consequence of the increasing rotative velocity of the earth's surface in the opposite direction, as in the case of the trade winds in the lower latitudes. In collating the observations of various navigators, we find reason to conclude that, in ordinary states of weather, this current may be traced from the coast of Newfoundland to Cape Hatteras, and perhaps to Florida, the reflux influence which sometimes follows a violent gale, being of short duration." According to this view of the case, the Gulf stream, in its course from Florida to the Banks of Newfoundland, is in part embedded upon a colder current, which is setting in the opposite direction in its progress from the polar regions. The impulses by which the opposite currents are maintained being as permanent and unchanging as the diurnal rotation of the planet, their opposite courses on this coast, while in contact with each other, are no more surprising or inexplicable than those of 2 opposite currents of atmosphere moving in the same manner; and the latter are often known to maintain opposite courses for a long period, and at high velocities. The drift ice from the polar basin is all found in the western portion of the Arctic and north At-

lantic oceans, notwithstanding the influence of violent westerly winds. A writer in the London "Nautical Magazine" supposes that a portion of the polar current, after bearing the ice along the eastern edge of the grand bank into the Atlantic, there becomes exhausted or joins the Florida stream. By its action the great stream of ice is undoubtedly brought thus within the dissolving influence of the Gulf stream, and the grand bank itself perhaps owes its origin to the deposits which have resulted from this process during a long course of ages. But this portion of the polar current probably joins the Gulf stream in no other manner than by intruding upon and passing under the same, the order of superposition being determined by the diversity of temperature, or by the deeper position of the polar stream. The icebergs being thus carried southward by the deeper polar current, their rapid destruction is here effected by the water of the Gulf stream, and we are thus relieved from these dangerous obstructions which would otherwise be found in the lower latitudes of the Atlantic. These two streams of current therefore do not coalesce in any proper sense, but like other currents, both atmospheric and aqueous, pursue each its determinate course, the Gulf stream being thrown eastward by the greater velocity which it acquired in latitudes nearer the equator, and the polar current being thrown westward, along the shoals and soundings of the American continent and its contiguous ocean depths, by the slower rotation which it derived in higher latitudes. The writer above alluded to, supposes the natural course of the polar current from Davis's strait to be toward the coast of Morocco in north Africa; but a little attention to the effect of the earth's rotation on this current will show that both it and the ice-drifts that are borne on its surface must be turned westward, as here described, in spite of the powerful westerly gales which prevail in these latitudes. Light articles, like bottles, however, which are set afloat to determine the drift of currents, will not only yield greatly to the influence of these winds, but falling into the surface current of the Gulf stream, will of course accompany that current in its progress to the coast of Europe, where a leading branch of this stream is found penetrating the polar sea along the coast of Norway, and appears to be ultimately resolved into the polar current. The south-easterly branch of the warm stream assumes the shorter and more direct circuit of gravitation by the coast of north Africa to the tropical latitudes, from whence it again merges in the Florida stream. It is by this system of compensation, aided by various subordinate circuits, such, for instance, as Rennell's current, that the great mechanical system of oceanic circulation is apparently maintained; and were the influence of winds wholly unfelt upon the ocean, it is probable that the same system would still be maintained in all its essential features by the mechanical influences of the earth's rotation, combined

with the tides and a state of unstable equilibrium. Of that reciprocating movement of the ocean waters called under-currents, we know but little. In Baffin's bay we find them floating contrary to the surface-current, carrying immense icebergs through the surface ice with inconceivable velocity. And in various parts of the more temperate regions, we find them flowing mostly toward the equator. The following we select from several instances contained in the report of Lieut. Walsh, U. S. N., commanding the U. S. schooner Taney, to Lieut. Maury: "The surface-current was first tried by the usual mode (a heavy iron kettle being lowered from a boat to the depth of 80 fathoms); then, for the trial of the under-current, a large chip-log, of the usual quadrantal form, the arc of it measuring full four feet, and heavily loaded with lead, to make it sink and keep upright, was lowered by a light but strong cod-line to the depth of 126 fathoms (the length of the line); a barrega was attached as a float, a log line fastened to this barrega, and the rate of motion of this float as measured by this log line and the glass, and the direction, as shown by a compass, were assumed as the velocity and set of the under-current. No allowance was made for the drag of the barrega, which was always in a different direction from the surface-current. It was wonderful indeed to see this barrega move off against the wind and sea and surface-current, at the rate of over one knot an hour, as was generally the case, and on one occasion as much as $1\frac{1}{2}$ knot. The men in the boat could not repress exclamations of surprise, for it really appeared as if some monster of the deep had hold of the weight below, and was walking off with it. I will cite from the log several instances of these experiments. On May 11, in lat. $24^{\circ} 48' N.$, long. $65^{\circ} 25' W.$, we found a surface-current of $\frac{1}{2}$ knot per hour, setting to the west, and an under-current at the depth of 126 fathoms, of 1 knot, setting W. S. W., temperature of water at surface, 77.3° , at 50 fathoms, 77.5° , at 100 fathoms, 78.5° . The current felt by the vessel on that day (as deduced from the comparison of the true positions obtained by astronomical observations and chronometers, with those of the dead reckoning) agreed with this trial of the surface-current, being the same within a fraction, viz., 0.3 knot, westerly. On this day the sea was covered with a species of medusæ of a dark red color, spherical in shape, from $\frac{1}{2}$ to $\frac{3}{4}$ inch in diameter. On May 12, at 4 P. M., in lat. $25^{\circ} 55' N.$, long. $64^{\circ} 48' W.$, the surface-current was found to be $\frac{1}{2}$ knot, setting N. N. E., and the under-current (at 126 fathoms) $1\frac{1}{2}$ knot, setting S. E., being the strong under-current I have alluded to: this was well ascertained by several trials—temperature of water at surface, 75° , at 50 fathoms 76° , at 100 fathoms, 69° . From this time, 4 P. M. to 8 A. M., the following morning, we experienced a strong current of 1.3 knot per hour, setting N. 14° E., as determined by the observations. While trying the currents in

the boat, all hands remaining on board the schooner were employed sounding with 500 fathoms line, but failed to get the temperature at that depth, there being at the time too much swell."—To the "Physical Geography of the Sea," by Lieut. Maury, we are indebted for much information. We find facts stated there which are not found elsewhere. Although we may not always agree to the inferences drawn, we are indebted to him for the best delineation of soundings in the blue water of the North Atlantic ocean, as the expeditions for that purpose were first planned by him. These depths are not as accurate as could be wished, on account of the methods at first used in sounding,—these have been improved, and a short history of deep-sea soundings is exceedingly interesting. Capt. Ross, R. N., in 1818, sounded in 1,050 fathoms, using a $2\frac{1}{4}$ inch whale line, with a weight of upward of 100 pounds. This weight was 27 minutes in descending, and it required an hour to haul it in. It was considered a tedious method, and other plans tried by the English, French, and Dutch, using silk thread, twine, and also the common lead line. These attempts failed, as the shock could not be felt on the lead striking the bottom, owing to the insufficiency of the weight, stray-line and under-currents—34,000, 39,000, and 50,000 feet were tried without success by officers in the U. S. N.; and although Capt. Denham, of H. B. M. ship Herald, reported bottom in the South Atlantic at the depth of 46,000 feet, we do not consider his success as any evidence of the depth, or the line run out by others as a failure in reaching bottom. We wanted to see the bottom, and thus know that the messenger had performed its duty. An ingenious arrangement by Passed midshipman Brooke, U. S. N., detaching the weight on its reaching the bottom, and allowing the line to be drawn up with a rod, the foot of which was armed with tallow or with the barrel of a common quill attached to it, furnished this, but we wanted something more—we wanted the perpendicular distance. The plan adopted in the U. S. N. until the voyage of the Arctic in 1856, was using twine, made expressly for the purpose, sufficiently strong to sustain a weight of at least sixty pounds in the open air—a cannon ball of 32 or 68 pounds weight was appended to it, and on being thrown overboard, was allowed to take the line freely from a reel. The line was divided into 100 fathom marks, and the time noted as they successively went out. This furnished an average time of descent at different depths, and was sufficiently accurate to show that the depth of the ocean had been overrated. These soundings were made from a boat, so as to enable the men with their oars to keep in such a position that the line should be perpendicular. The timing the line as it goes out and ascertaining the "law of descent," is, after all, but a check on your operations in giving the time nearly when the line ceases to flow out according to that law of descent; for currents will act on the line more or less, and cause it to sway in the bight, so that

the law of average time of descent is no law after all that can be read, and one would be at a loss to know whether to depend upon the time or the length indicated on the line, to ascertain the depth. It would perhaps be useful if the actual depth was first ascertained in very deep water with Massey's sounding machine, to ascertain the law of descent; so that those not furnished with any better mode, could sound; but it would be necessary to have a uniform standard for the figure of the weight and also for the line. The weight should not be a sphere, on account of the greater resistance experienced by that form.—The plan for deep-sea soundings adopted by the Arctic, in 1856, was as follows: The Arctic was fitted with a steam reel, worked by two oscillating cylinders; the whole engine and reel weighing about 2,700 pounds. The reel carried about ten thousand fathoms of deep-sea line. The sounding line was passed through two leading blocks; the first hooked to a pendant from the foremast head, on either side, about half way down. There was another hooked to the head of an iron davit, used instead of a cat-head, and made to shift from one side to the other. The main dependence for vertical depth was on Massey's patent sounding apparatus. Every opportunity which occurred, was taken advantage of to compare the line (which was marked in the ordinary way) with the indicator, and this was done in the Arctic sufficiently often to justify great confidence in its accuracy. In one experiment in 2,070 fathoms water, only 2,150 fathoms were used, and if the line had been stopped a little sooner, it was clear that an entire correspondence might have been obtained; but it is entirely out of the question to suppose that the exact time can be ascertained when the weight strikes the bottom. By taking the exact time of descent of each hundred fathoms, some approximation may be arrived at, but under-currents may occur, and other impediments—rain squalls may intervene at night, so as to prevent the possibility of getting the exact elapsed time. The plan of allowing the line to run until it was certain that enough was out to reach bottom, was preferred, and then reeling up, very slowly at first, gradually increasing the revolutions of the reel as the lead approached the surface. The self-detaching apparatus of Lieut. Brooke, U. S. N., with a lead of about 100 to 150 pounds weight, about 2½ feet long, of a conical form, with its greatest diameter 4 inches from the lower end, tapering thence to the upper end, to 2, was used. This lead had a hole 1 inch in diameter through its whole length, to allow an iron shaft to pass through. The shaft had a hole in the lower end, 2 inches deep, and sufficiently large to admit 4 or 5 common quill barrels with their ends cut off. These quills received the specimens of the bottom when the end of the lead or shaft plunged into it. The upper end of the shaft had Massey's patent apparatus on it. After a dozen deep-sea casts had been made, the line was apt to break when reeling it up again. In all these cases new

line was got up, bent on and marked; and the operation persevered in, until finally successful. In very pleasant weather, two hours were sufficient for a cast of 2,000 fathoms, and the time of the descent of the lead was not much greater than that of hauling it up again. Ten thousand fathoms of deep-sea line lasted from the Banks of Newfoundland to the banks of the Irish coast, and the time occupied was 22 days. The distance between the positions occupied, varied from 20 to 100 miles—the deeper water having the larger. The Massey's indicator or sounding apparatus was increased to 21,000 fathoms by Mr. Saxton, of the coast survey office, and did not need to be turned back until nearly arrived at its highest numbers. The engine working the reel, was driven by steam from the main boiler, and was placed just forward of the smoke-stack, the reel being placed across the deck. The power of the engine was sufficient to give five hundred revolutions per minute to the reel. The officer in charge was very cautious in manœuvring the vessel, and keeping the engineer promptly advised of slowing, stopping, and starting ahead the engine, so that the line could descend as nearly perpendicular as possible. The deep-sea soundings and low temperature of the ocean, at great depths, obtained by Lieut. Berryman, commanding the steamer Arctic in 1857, are very interesting, and the latter may be considered as one of the greatest discoveries in physical geography. These were a continuation of the Gulf stream observations, under the direction of Prof. Bacha. Lieutenant Berryman sailed from New York July 11, and the first deep-sea sounding obtained was 747 fathoms. This was in the Gulf stream, about 70 miles S. E. of Nantucket. Saxton's thermometer in this place indicated a temperature of 19° at the depth of 450 fathoms. E. 17° S. from this about 30 miles, bottom was found in 1,005 fathoms; the temperature at that depth being 20°, and N. 40° E. from this, bottom was reached with 765 fathoms, the temperature being 38°. Thence the soundings were continued to the eastward in the Gulf stream, the depth soon increasing to 1,075 fathoms, then gradually to 1,441 fathoms, in the meridian of Cape Sable, when it decreased until he had reached the northern edge of the Gulf stream, in the longitude of Halifax, where he found 1,076 fathoms. There one of the thermometers indicated 10° and the other 30° of temperature. Eastward of this the soundings were north of the stream, increasing but little until he reached the meridian of Sable island, S. E. from which, in lat. 43° 18', long. 59° 28', he sounded in 1,464 fathoms, using two thermometers, one of which showed a temperature of 22°, the other 8°. This was about midway between the Gulf stream and Sable island; soon after this the line parted while reeling in. In Oct., Lieut. B. commenced the examination of the section of the Gulf stream between Halifax and Bermuda. In lat. 42° 44' N., long. 63° 35' W., he found 175 fath-

oms. The next successful cast was in lat. $42^{\circ} 26' N.$, long. $68^{\circ} 14' W.$, 910 fathoms. He had not then reached the Gulf stream, and as he continued on, the depth increased until he reached the parallel of 40° , when he found bottom at the depth of 2,987 fathoms, nearly $3\frac{1}{2}$ miles. The experiments for temperature at various depths, here gave at 250 fathoms 71° ; at 500, 42° ; at 1,000, 36° ; and at 2,987 fathoms, 20° . The next cast was in lat. $39^{\circ} 12' N.$ long., $68^{\circ} 57' W.$, where he found 2,332 fathoms and a temperature of 25° . The next attempt to sound was unsuccessful, the line parting at 8,600 fathoms bottom, on commencing to reel in, losing every thing; and on making another trial by attaching the wire line to the hempen, it again parted while reeling in, losing 1,630 fathoms of wire, and 1,530 of hempen line, one Saxton's thermometer, and one Massey's sounding machine. Lieut. Berryman had nearly reached the southern edge of the Gulf stream at this time, and in consequence of these accidents was obliged to give up the examination. The apparatus for sounding was somewhat improved from that used on the former voyage. Massey's machine was attached so that the turning or twist of the line in descending could not affect the register, and Brooks's plan for detaching the weight on striking bottom was applied to a lead having a form of less resistance than that of a sphere. The self-registering thermometer of Mr. Saxton was always used. These instruments were prepared at the coast survey office expressly for registering submarine temperatures, and being submitted to tests before leaving the office, were found to be accurate. The temperature is ascertained by the expansion and contraction of two thin pieces of metal, silver, and platina, soldered together, and afterward bent into a spiral form, a register being attached so as to record the lowest degree of temperature reached. It has been suggested that the immense pressure to which these delicate thermometers were subjected when at great depth might be the cause of error, but we do not think it could cause them to record a lower temperature. At any rate, we feel satisfied that the anomalies shown in some of the results are entirely owing to the sudden check of the momentum of the instrument when descending, or to some blow which causes the index to change its place. Two of these thermometers were some time used with a view to testing them. On one occasion they gave 11° and $11\frac{1}{4}^{\circ}$; the next, both read 10° ; the next, 9° and $9\frac{1}{2}^{\circ}$; and on the next the difference was 4° , an agreement remarkable, considering the rough usage they are subjected to.—The result of all these soundings indicates less depth than was supposed from calculation or from former soundings. The greatest depth, as shown on the chart, appears to be in a space on the southern part of the Gulf stream, from long. $67^{\circ} W.$ curving toward the north to lat. 41° and long. 49° (S. E. of the Bank of Newfoundland), then south as far as lat. 33° , when it turns toward the N. W.

and then W. to long. 67° . The soundings here are rather doubtful, the greatest actually obtained was 4,580, and the greatest trial without success, 6,600 fathoms. The soundings by Lieut. Berryman, for the purpose of examining the basin between Newfoundland and Ireland, exhibit a moderate degree of depth, nowhere exceeding 2,070 fathoms, and with the soundings taken by others show that a plateau exists in this basin which extends to the south of the Azores, thence S. W. to lat. $20^{\circ} N.$, and then N. W. to within 420 miles of Bermuda, with less than 2,000 fathoms on it; that while a greater depth is found between this plateau and both continents to the south of the Bank of Newfoundland and the coast of Ireland, there is a regular descent from each of the proposed terminations of the Atlantic submarine telegraph.

ATLANTIOA, the name of a work, by a speculative Swede, Olaf Rudbeck, written in Latin and Swedish, wherein the author labors to prove that the Atlantis of the ancients was Scandinavia, and that the Greeks, Romans, and all the Teutonic branches of the European family, originated in Sweden. It was published in 1675-'79.

ATLANTIDES, the children of Atlas, in Greek mythology. The Pleiades had Atlas and Pleione as their parents; the Hyades and Hesperides, Atlas and Aethra.

ATLANTIS, according to the tradition of the Greek geographers, a large island in the Atlantic ocean, to the west of the coast of Africa, and the pillars of Hercules. It was said to possess a numerous population, begotten by Neptune of mortal women. The sea-kings of Atlantis were said to have invaded the west of Europe, and of Africa, and to have been defeated by the Athenians and their allies. To account for its disappearance in later times, when navigators had acquired a positive knowledge of the longitudes where the island Atlantis was supposed to be, the further fiction was elaborated that the inhabitants had become desperately wicked, and the island was swept away by a deluge. Plato mentions this in his *Timæus*, and says that an Egyptian priest told it to Solon. On the old Venetian maps, Atlantis is put to the west of the Azores and Canaries. Of course, many moderns have identified it with America. The "New Atlantis" is an allegorical fiction of Lord Bacon. It is, like the Atlantis of the ancients, an island in mid-Atlantic, where the author is wrecked, and finds there an association for the cultivation of natural science, and the promotion of improvements in the arts.

ATLAS. I. In Greek mythology, son of Japetus and Clymene, and brother of Epimæus and Prometheus, who made war, with the other Titans, against Zeus, and was condemned to bear heaven on his head and hands. Some stories represent him as a great astronomer, astrologer, and wise demigod, who first taught man that heaven had the form of a globe. Ovid relates that Perseus, the hero, came to

Atlas and asked for shelter. It was refused, whereupon Perseus, by means of the head of Medusa, changed him into Mount Atlas, on which rested the firmament. II. In anatomy, the first vertebra of the neck, so named because it supports the globe of the head. III. A collection of maps, first so called by Mercator, in the 16th century, because the figure of the mythological Atlas was generally drawn on the title-page.

ATLAS, a mountain system which occupies the whole extent of north-western Africa, from Cape Ghir to the gulf of Cabea, or little Syrta. It is divided into the great and little Atlas. The little Atlas is the range nearest the sea-coast; the great is more inland, and borders on the desert. In fact, however, the 2 ranges are one and the same system, though sometimes connected only by separate mountains, or ranges of low hills. On the coast, the range skirts the Mediterranean, from Cape Spartal, and the straits of Gibraltar, to Cape Bon, on the north-east of Tunis. The Atlantic shore is sometimes sandy and low, at other times formed by cliffs, which do not attain any great height, except at Cape Ghir. The Mediterranean shore, between Capes Spartal and Bon, is generally rugged, and in places attains a considerable height. Between Cape Bon and the gulf of Cabea it is rocky, but without reaching any great elevation. The southern slope of the Atlas reaches the great desert, from which it is separated by a region of sand hills, shifting with every strong wind, and gradually making encroachments on the fertile lands at the foot of the mountains. On the west of the gulf of Cabea, Mount Nofusa, the last eastern spur of the Atlas, joins Mount Garian, which extends into the regency of Tripoli. The French geographers include within the limits of the Atlas their own province of Algeria, together with the empire of Morocco, and a part of Tunis. The whole area is 500,000 square miles, including a great variety of surface, mountains, valleys, and extensive plains. The loftiest peaks form a diagonal line, striking across the general course of the mountains from S. W. to N. E. This line begins at Cape Ghir, on the Atlantic, which rises almost perpendicularly from the sea to a great elevation. It then stretches away, E. of the meridian of Morocco, then turns abruptly N. E., and from this quarter 4 important rivers take their rise, the Wady Oum Erbegh (Morbeys), the Maloovia, the Taflet, and the Draha. At this precise spot, the loftiest peaks of the whole mass seem to be brought together, and the most elevated chain runs away N. The principal chain traverses a region entirely unknown, called the desert of Ansad, the boundary line between Morocco and Algiers. Here the name great Atlas is first applied. The natives call it Djebel Tedla. The principal chain recurs in Algeria, where its highest part is called Wanashrees, or Warensenia, and terminates on the banks of the Shelliff, whose valley makes a gap in its course. It re-

appears S. W. of Algiers, in the lofty summits of the Jurjura. From this point, the chain follows a direction parallel to the coast, then it dips again to the S. E., and takes the name of the mountains of Wannooqa. Further on to the east, we meet it as the Djebel Aurea, and approaching the coast again, it penetrates into the territory of Tunis, under the name of Mount Tipara, terminating at Cape Blanco and Cape Zibeb, on the north of the city of Tunis. The height of these mountains has not been determined. The highest summits, the Miltain, S. E. of the city of Morocco, and other mountains near the Wady Oum Erbegh, and the Maloovia, are rarely free from snow. Their altitudes probably reach 9,000 to 15,000 feet. The little Atlas is by no means so lofty. The great Atlas is the water-shed of the province. The rivers flowing north from this line force their way through the lesser Atlas to the Mediterranean, while those that take their rise on the southern slope are lost in the marshes of the desert. There are several defiles through the Atlas, the best known of which are those of the Beboonan, leading to Terodant in Morocco, and the Biban, or Iron gate on the east, leading from Algiers to Constantine. The geological constitution of these mountains presents old limestone alternating with a schist, oftentimes passing to a well-characterized micaceous schist, or gneiss. The stratification of the gneiss is also very irregular, only presenting organic debris; then come schistose clays, alternating with secondary limestones; then come limestone with white clays, and iron sands resting on blue clay. This formation is particularly developed near Oran, and the plains in which the soil is formed from it are of great fertility. Volcanic rocks have been found in small quantities. There are veins of iron, copper, and lead. Salt-petre is found near Terodant. About 50 miles from the same town, excellent malleable iron is found. At Elala there are copper and silver mines. The vegetation embraces all the varieties of both temperate and tropical climates. The Atlas was known to the ancients, and the Romans formed several colonies in the district.

ATMOMETER (Gr. *atmos*, vapor, and *metron*, measure), an instrument invented by Leslie for measuring the amount of water evaporated in a certain time. It is not now in use.

ATMOSPHERE (Gr. *atmos*, vapor, and *σφαῖρα*, a sphere), the body of air which surrounds the globe, the gaseous fluid in which we live, and without which life cannot be sustained. So dependent are we upon its purity remaining constant, that even when its composition is slightly changed, our health suffers, or we may indeed instantly perish in consequence. And yet noxious elements are ever pouring into this great reservoir of gaseous exhalations. They come forth from volcanoes in immense volumes; they silently steal upward in the invisible miasmata of marshes; from all decaying bodies they mix their poisonous contaminations with the pure air; and still this ever remains

the same life-supporting element; as in the great salt ocean, there are compensating agents silently working to counteract the effects of the enormous quantities of strange substances introduced, which would otherwise soon destroy its useful qualities.—Air consists essentially of 2 gases, oxygen and nitrogen, in a state of mechanical mixture. But with these are always present a small proportion of carbonic acid gas and aqueous vapor. In the vicinity of large cities ammonia is found, too, in small quantity; and nitric acid is generated in thunderstorms by the chemical combination of nitrogen and oxygen induced by the electrical shock. These, which may be regarded as accidental impurities, are soon dissipated in the great bulk of the atmosphere, or they enter into new combinations, and are precipitated upon the earth, or are washed down by the rain. The proportions of the 2 elements of the air hardly vary—whether this is taken from the summits of the highest mountains, from extensive plains, from thickly populated cities, or from crowded hospitals—nor are they affected by season, climate, or weather. In closely confined places, exposed to putrescent exhalations, the purity of the air is necessarily much affected; the proportion of oxygen diminishes, and mephitic gases, as sulphuretted hydrogen and carbonic acid, are introduced. Prof. Nicol gives an analysis of air collected in a filthy lane in Paris, in which the oxygen constitutes 13.79 per cent. only, instead of 23 per cent., its usual proportion; nitrogen was present to the amount of 81.24 per cent.; carbonic acid, 2.01; and sulphuretted hydrogen, 2.99 per cent. Carbonic acid gas and aqueous vapor are more variable in their proportions; and the former, though found at the highest altitudes, has sometimes escaped detection in air collected at sea. Its ordinary composition is thus given by Brande:

	By measure.	By weight.
Nitrogen.....	77.50	75.55
Oxygen.....	21.00	23.33
Aqueous vapor.....	1.43	1.08
Carbonic acid.....	0.08	0.10
	100.00	100.00

Regnault calculates, from numerous analyses, that it is by measure oxygen 20.90, and nitrogen 79.10; and Prof. Thomson, in the article "Atmosphere," in the "Encyclopædia Britannica," gives as the mean of 10 careful trials a proportion by volume of 79.9785 parts of nitrogen, and 20.0265 of oxygen. The near approach of these 2 gases to the number 80 of the one and 20 of the other, cannot fail to strike the attention of those who study the analyses made by Cavendish, Davy, Gay Lussac, Humboldt, and others. And as a volume of nitrogen is equivalent to one atom, and half a volume of oxygen is equivalent to an atom, the inclination is very strong to consider air as a compound of these gases in the equivalent proportions of 2 atoms of nitrogen and 1 atom of oxygen. But the differences of specific gravity, of temperature, structure, or form, which usually accompany the

change by chemical combination are here wanting; and, moreover, air is recomposed by simple mixture of its elements, with no evidence of any chemical change taking place. The phenomena of refraction are such as indicate a mixture; and a still more conclusive proof is that air held in solution in water does not consist of the same proportions of its elements; but from the greater solubility of oxygen, it contains of this about 83 per cent., and of nitrogen 68 per cent. We are therefore not authorized in the conclusion that air can be otherwise than a mechanical mixture of its elements.—Carbonic acid gas, increased to the proportion of 5 to 6 per cent., renders air unfit for sustaining animal life. A candle ceases to burn when it contains 3 per cent. of this gas. One may live, however, in an atmosphere containing 80 per cent. of it for a short time, but not without suffering. But if carbonic oxide, which has only 1 atom of oxygen, instead of 2 atoms, to 1 of carbon, is present even in the small proportion of 1 per cent., it may prove instantly fatal. This poisonous gas is generated by the combustion of charcoal in confined places. Carbonic acid is generated by combustion of carbonaceous substances, with free access of air, and by the analogous process of the breathing of animals—an atom of carbon unites with 2 atoms of oxygen; and the solid matter takes the form of this invisible gas. By several processes it may be restored to a fixed or tangible shape. Man requires from 212 to 353 cubic feet of air per hour. In breathing, the oxygen in part unites with carbon in the system, and the air expired contains 4½ per cent. of carbonic acid gas. This is immediately dispersed through the atmosphere by the property of diffusibility, possessed in such a remarkable degree by the gases; but if confined in close places, it soon accumulates and contaminates the air. Though this is the heaviest of the gases, and is generated near the surface, it is found in larger proportion in the air of elevated places, than in that below. The reason ascribed, that this is owing to the plants absorbing it in the lower strata, is not satisfactory, as it is in these strata produced.—Growing plants are the compensating agents, that counteract the noxious influences of combustion and the breathing of animals; as in the ocean the coralline insects as quietly perform their great office of separating from the water the soluble contaminating ingredients, poured in from the innumerable rivers that feed it. Plants as well as animals breathe the air, but the effect of this respiration is just the reverse of that of animals. The carbonic acid gas is decomposed in the laboratory of their vessels, the solid carbon is added to their structure, and the pure oxygen is expired. It is true, the process is reversed in the night, but with much less effect. This change in the action of plants at night is the reason why they should not be kept in sleeping apartments.—Oxygen thus appears to be the life-sustaining element of the air for ani-

male; while nitrogen has the somewhat negative duty of restraining, by its bulky proportions, the too active influence of its fiery partner. Oxygen is diluted with it, as good spirit is with water, to make it wholesome. Both the weaker elements, however, have some other uses, being found as constituents of vegetable and animal substances.—Water, moreover, in the form of vapor, has already been noticed as one of the constituents of the atmosphere. It manifests its presence by condensing in visible moisture and drops upon cold surfaces. When the air is warm, its capacity of holding water is great; as it becomes cool, this capacity diminishes, and the water, that is now in excess, appears as dew, or mist, or rain. The atmosphere is said to be dry, when it has not so much moisture in it as it is capable of holding at its temperature; evaporation then takes place. But let the temperature fall, and the same air, that was called dry, is now damp. The absolute quantity of vapor has not changed, but the relative quantity of what the air is capable of holding, and that actually in it. As the air becomes cool, and reaches a degree at which it is saturated with the water it contains, and this begins to condense upon cold surfaces, this degree of temperature is called the dew-point. If it is high, the absolute quantity of vapor in the air was great; if low, there was little vapor in the air. The relative quantity was the same in both instances, as it always must be at the dew-point. As the hot airs of the tropics are swept over the Atlantic in the trade winds, they suck up moisture like a dry sponge. Saturated with it, as they pass over the snowy summits of the Cordilleras, and their particles are compressed together with the cold, they shed it, like the same sponge squeezed in the hand. Thus does the atmosphere fill its office as a compensating agent, carrying away the excess of waters of the ocean, that, though all the rivers flow into it, it shall never be full—feeding, too, the dry places of the earth, that its wells and springs shall never lack their supplies.—Air being a material substance, though invisible, possesses many of the physical properties of the solid and liquid bodies, as weight, inertia, elasticity, impenetrability, capacity for heat, &c. A vessel exhausted of air is found to weigh less than when filled with it; and in this manner it has been ascertained that 100 cubic inches of pure and dry air, at a temperature of 60°, and under a pressure of 30 inches of the barometer, weigh 81.0117 grains. Other gases are referred to air at this temperature for the expression of their comparative weight. Water is 815 times heavier than air; but at the freezing point the difference is as 770 to 1. From its weight result its inertia and the pressure of the atmosphere. It cannot be set in motion without exertion of force, nor in motion be retarded without opposition of force. Its momentum, as with other bodies, is its weight multiplied by its velocity. Air in motion is a

mechanical force, applied to propelling ships and windmills. The pressure of the atmosphere is the weight of the column of air. If this were alike dense throughout its height, the upper limit of the atmosphere would be easily calculated from the weight of a cubic inch, and the pressure of 14.6 pounds upon the square inch. It would be about 5½ miles. But from the property possessed by the gaseous bodies of expanding in bulk or becoming more rare, in proportion as the force that confines them is removed, the weight of a column of air is not directly proportional to its height. This tendency of the particles of air to separate from each other, as the pressure that confines them is taken off, is called the elasticity of the air. Its effect is, that every successive layer of air of any given thickness is of less density and weight than the layer of the same thickness beneath it. The rate of this decrease of weight may be thus expressed: when the height increases in an arithmetical ratio, the volume increases in a geometrical ratio, and the weight diminishes in the same. For example, at the level of the sea calling the volume 1, and the density or weight 1; at the height of 2.705 miles the volume is 2, and the density ½; at twice the height the volume is 4, and the density is ¼; at 3 times the height the volume is 8, and the density ⅛. But notwithstanding this tendency of expansion, the atmosphere is proved by calculations based on its refractive properties to find somewhere a limit, and this appears to be not far from 45 miles above the surface. The pressure of the atmosphere is made apparent by removing the air from any tube, the lower end of which is immersed in water or any other fluid. This fluid will be pressed up the tube to a height corresponding to the pressure upon its surface. If this be at the level of the sea, where the pressure is 14.6 pounds on the square inch, water will rise 33 feet and mercury 29 inches. At any greater elevation, the pressure being less, a less height of the fluid will balance it. Such an instrument as this tube is the barometer, by which the difference of elevation is determined by the different heights of the column of mercury; the calculation being made on the principle above described, and corrected for temperature and the latitude of the place. There is another instrument used for the same purpose, based on the property of water boiling at a less temperature, as the pressure of air upon its surface is taken off. For every 549½ feet increase of elevation, it is found that the boiling point is one degree less. Correction is in this case also to be made for the temperature of the air. Well-constructed instruments of this kind have been made to produce very fair results in experienced hands. Familiar illustrations of the pressure of the air are afforded by the common pump, which is but such a tube as has been already referred to, furnished merely with a clack or valve for lifting out the air, and then the water which follows it. The power applied to lift

the air is equal to its pressure at the place multiplied by the height it is raised, or to the weight of the column of water. There can, therefore, be no expedients that will lessen the power required to work a pump, unless they can present some form more simple, and which involves less friction, than the ordinary form of the pump, and this seems hardly possible. The pressure of the air is also well illustrated by the common leather "sucker," which the boys make for a toy—a mere disk of soft leather, with a string knotted at one end passed through its centre. When moistened and applied to any smooth surface, care being taken to expel the intervening air, it is attracted to it by the external pressure. By the same principle insects walk upon the ceiling, and the patella or limpet, and some other shell fish, hold fast upon the smooth rock. So great is this pressure, that the force exerted upon the body of a moderately sized man is estimated at about 15 tons, sufficient to crush him, as it inevitably would, if applied to only a portion of the body; but quite harmless when pressing with perfect elasticity everywhere alike—from the external parts inwardly, and from those within outward. Let the pressure be taken off from any portion, as by the cupping instrument, and one is immediately sensible of the power that is exerted upon the parts around, painfully pressing them into the vacant space of the instrument.—Elasticity is possessed, in a remarkable degree, by gaseous bodies. If the pressure is removed from them, their particles repel each other, and the tendency is to expand indefinitely. This force, as expressed by the law of Mariotte, its discoverer, varies in exactly the same proportion as the density of the air. But as air has been allowed to expand to more than 2,000 times its usual bulk, and been compressed into less than one-thousandth—and at these extreme degrees of rarefaction and condensation it is difficult to determine its elasticity with rigor—this law may possibly not admit of full application. The effect of the elasticity of air is seen in the unroofing of houses and bursting outward of windows in hurricanes. A partial vacuum being produced by the rotary motion of the hurricane, the air within expands, and lifts off the roof, or bursts open the doors and windows. A similar effect is observed in the expansion of air confined in a bladder, and taken from a low level to a great height. The external pressure being reduced, the air within tends to expand to the same degree of rarity as that without, and with such force as to burst the bladder. It is this property, possessed in the greatest perfection by the gaseous bodies, that renders air so excellent a material for springs, air-beds, air-guns, &c.—The impenetrability of air is its property of preventing another body occupying the space where it is. The diving-bell is a good illustration of it, as also of its elasticity; for when sunk to the depth of 84 feet, the water will be forced in, so as to half fill it; at the depth of 100 feet it will be 3 quarters filled; at

1,000 feet it will be filled to within a thirdeth. On drawing it up, the air will expand and drive out the water.—The capacity of air for heat is shown by its expansion and increased rarity, as it is subjected to the influence of this agent. From the freezing point upward it expands $\frac{1}{15}$ of its bulk for every degree of temperature. This is easily exemplified by heating air confined in a bladder. Its expansion soon swells the bladder and causes it to burst. As its bulk increases, its density or weight diminishes. The colder and heavier air around it presses through it, and the more buoyant fluid is lifted up. On this principle were constructed the first balloons. It is this principle that gives rise to the currents of air or wind, the colder bodies flowing along the surface to fill the spaces left by the ascending columns. Thus the trade winds blow from the temperate regions toward the torrid equatorial belt. The whirling tornado, and all the phenomena of the winds, owe their origin to local heating and rarefaction of the atmosphere. The rays of the sun pass through the upper strata of the atmosphere, imparting to them no heat. This the air receives only near the surface. As we ascend, the temperature diminishes one degree for every 352 feet. Near the equator perpetual snow covers the mountains at the height of 15,907 feet; in latitude 60° it is found at 8,818 feet; and in 75° at 1,016 feet. Did the sun's rays impart no effect to the atmosphere, the great body of it would be seen as blank darkness; but a partial absorption of a portion of the rays takes place, and reflection of the blue rays. This gives the blue color to the sky, while that of the clouds and the rainbow comes from the effect of the light upon the particles of vapor floating in the atmosphere. These colors are too faint to be perceived in any small quantity of the air. It is only by looking into the great depths of the atmosphere that they become visible, as the color of the ocean is only apparent when the waters are seen in mass.

ATMOSPHERIC ENGINE, also called **AIR ENGINE**, or **CALORIC ENGINE**, is an engine to transform heat into power by means of air. Repeated attempts have been made since the discovery of steam as a motive power to use air as a substitute, and in the records of the U. S. patent office from 1796 to 1847, we find that patents were granted in 1824, '26, '28, and '29 for atmospheric engines. In the year 1836, M. Franchot patented in France an atmospheric engine, in which a part he called the calefactor was composed of a number of parallel pipes. The warm air after working the piston escaped through these pipes, and the cold air ran in around the same pipes in an opposite direction, where it was partially heated by the caloric from the escaping air. It was a process similar in principle to that of warming the feed water of a steam-engine with the escaping steam. In the year 1840, J. and R. Sterling patented, in England, an improved manner of applying this

principle. In their regenerator, the heated air expelled passes first through a number of parallel sheets of metal placed close to each other, where it is partially cooled by contact, and secondly through a number of small pipes, around which cold water is constantly running; at the return stroke the same air returns first through the pipes, and then between the metallic plates from which it resumes the caloric left there in the passage outward. In the same year, Franchot patented the use of metallic wires or of metal shavings for obtaining the same result; whether before or after the invention of the Messrs. Sterling we do not know. The Sterlings built a machine after their patent, which has worked practically for several years, burning 2 pounds of coal per horse power in one hour. This machine may be working yet. Franchot and others also built experimental machines. In the year 1850, Mr. John Ericsson took a patent in England for an air engine, and Nov. 4, 1851, he had one granted to him in the United States for the same invention. The following extract from this last patent states what he claims as his invention: "What I claim as my invention, and desire to secure by letters patent, is the working cylinder and piston, and the supply cylinder and piston, of less piston surface, the two pistons being connected with each other, and working together, substantially as specified, in combination with the regenerator and heater, so that the air, or other circulating medium, shall pass from the supply cylinder to the working cylinder through the regenerator, substantially as specified, and give motion to the engine through the difference of area of the pistons; and this I claim, whether the air, or other circulating medium, be made to pass on the return stroke from the regenerator to the supply cylinder, or any other receiver, or into the atmosphere. I also claim, in connection with the working cylinder, the employment of two regenerators, substantially as specified, in combination with the valves, or their equivalents, for the purpose of causing the air, or other circulating medium, to pass, during a series of strokes, through one of the regenerators to the working cylinder, and back from the working cylinder through the other regenerators, and then reversing the action, as substantially specified. I also claim interposing the heater between the regenerator and the working cylinder, substantially as specified, to heat the air, or other circulating medium, as it passes from the regenerator to the working cylinder, as specified, to supply the heat required. And, finally, I claim communicating the power of the engine to the working beam or its equivalent, by the attachment thereof to one of the pistons, or piston rods, between the open ends of the two cylinders, said pistons being connected or braced to each other, substantially as specified, whereby I am enabled to render the engine compact, and effectually to brace and connect the two pistons and avoid undue strain, as specified." After making several small machines,

Ericsson proceeded with Messrs. Kitching & Co., to construct a large paddle-wheel steamship, named after himself, with air or caloric engines. She went out on a trial trip Jan. 12, 1858. The main shaft of the vessel was 18 inches in diameter, and was cranked in the centre. The radius of this crank was 8 feet 8 inches. To the crank-pin were attached two connecting rods at right angles to each other, and forming angles of 45° with the horizon, one rod being before the other behind the shaft. Each rod was connected with a working beam, and each beam was put in motion by 2 engines. Each engine consisted of 2 vertical cylinders, one above the other, in which moved 2 pistons fastened on the same rod. The lower cylinder, 14 feet diameter and 6 feet stroke, was the working cylinder, the other, of a section smaller by half, was a pump for compressing air, and had a reservoir situated above it. This reservoir communicated with the regenerator, and the regenerator communicated with the working cylinder, by means of pipes in which were valves properly disposed. Under the bottom of the working cylinder was a furnace. Preparatory to putting the machine in motion, air was compressed in the reservoir by a small auxiliary machine, a fire was lighted under the cylinder, and the piston brought to the bottom of the cylinder. The valves in the pipe were then open, the compressed air passed from the reservoir to the working cylinder, and forced up both pistons. When the upper stroke was completed, the air introduced in the working piston had been expanded by the heat from the bottom, and a volume of air equal to that of the pump had been compressed into the reservoir. The valves were now closed, and others opened to let the air in the working cylinder escape outside through the regenerator, when the piston descended by its own weight. This regenerator was a box 6 feet wide and 4 feet high, where were placed 900 parallel partitions in wire cloth, each 24 feet square, through all of which the escaping hot air had to pass. In this passage the air was deprived of a portion of its heat, and the wires were proportionally heated. This heat was taken at the next stroke by the air coming into the cylinder from the reservoir, and the operation was repeated over and over again. The wire used in making the wire cloth was 1-16th of an inch in diameter. The whole number of meshes for each of the 4 engines was about 100,000,000. The pressure found best was 12 lbs. per square inch above atmospheric pressure, or 27 lbs. The highest temperature of the air in the cylinder was 384° F. After passing through the condenser it was reduced to 80° F. Working at a velocity of 16 revolutions per minute, the weight of air which passed through the engine in an hour was 75 tons. There was an arrangement for cutting off at $\frac{2}{3}$ stroke, the air was thus expanded and let out at 12 lbs. pressure, that is 3 lbs. above the outside pressure. The steamship Ericsson was, after a few months, found deficient as a practi-

cal vessel, and her caloric or atmospheric engine was taken out of her to make room for a steam-engine. No full and accurate account of her performance has ever been given. In 1836, when Franchot had his first model built, he invited François Arago to witness an experiment. After a careful examination, the great astronomer turned round, and in a quiet manner said: "My friend, if your invention was absurd, I would go and say nothing; but no, the principle is right, the invention is great, and I say, if you have a family whose happiness depends on your success in life, or if you do not feel in yourself the faith and strength of a martyr, sell your machine for old iron, and look for a situation in a counting-house." Franchot neglected the warning, and at the present day is still pursuing through difficulties the realization of his plans. John Ericsson is doing the same in New York. In July 31, 1855, he patented an improvement in air engines, consisting mainly in the suppression of the air-pump and air-reservoir, as used in the steamship, and in heating the air in a separate vessel called a heater, instead of in the working cylinder. The object of the air-pump he now attains, by using two pistons in the cylinder. The first, called the working piston, has two rods, one on each side of the centre, and the second, called the supply piston, has one rod passing through the centre of the working piston. The supply piston is worked by a cam arranged in such a manner as to make it accomplish a stroke during the time that the working piston is passing slowly the dead point of the crank. With this arrangement it is necessary to yoke 2 cylinders on the main shaft, which act alternately with their full force. This plan was simplified, and became the object of another patent granted April 16, 1856. The leading feature of this new improvement consists in operating with only one piston, which compresses the cold air on one side into the generator and heater, at the same time that it is propelled forward by the force of the heated air on the other side. The air engine is thus transformed from a primitive single-acting machine into a double-acting one.

ATMOSPHERIC RAILWAYS. The first attempt to use atmospheric pressure as an agent of transportation, was made in 1810 by Medhurst, a Danish engineer. At that time he conceived the idea of carrying mails in a pipe, by creating a vacuum in front of a travelling piston, inside of which the letters were to be placed. Years after, in 1832, he conceived the project of driving cars by the same means. The piston being united to the front car by a rod passing through a longitudinal opening in the top of the tube, this opening was closed by a water valve, which opened to let the rod pass, and closed behind, ready for the return trip. The use of a water-valve made it necessary for the railway to be perfectly level, and for this reason the plan was soon laid aside. Since this first invention, patents after patents have been granted, in France and England, for valves to close the longitudinal

opening in the tube, for travelling pistons, air-pumps, &c., and for several new plans of using atmospheric pressure, or compressed air. The main difficulty in atmospheric railways is in constructing the longitudinal valve which closes the tube. It must fit with mathematical exactness, as the least imperfection in the closing would amount, for a few miles of pipes, to an opening larger than the pipe itself, and it must be so constructed as to open promptly without requiring much power, when the piston passes along, and to close tight behind it immediately after. Most inventors have devoted their time to this part of the subject, and among the 80 different valves which are before us, we find the most ingenious devices, and also the most absurd. In the greater number of them, India rubber, or leather is combined with metal plates to form the covering. The piston rod, whose section is long and narrow, like the water line of a clipper, opens the valve, and lets it close gradually, while a few rollers, attached to the car behind the piston rod, press upon the valve to make it tight, and a greasing instrument fills up the minute openings that remain. The plan of Olegg and Samuda, patented in 1838, was one of the first invented, and is to this day as good as any. It has been adopted on the atmospheric railway of Kingstown in Ireland, of Croydon in England, and in 1845 on that of St. Germain in France. At the top of a cast-iron tube, properly strengthened by circular flanges, eccentric to the tube, there is a longitudinal opening, the sides of which are planed, tapering upward; a band of iron, of the thickness of the tube, is made to fit in the opening. Over this, a band of leather is placed, extending some distance on each side of the iron band, to which it is firmly fastened. The part extending on one side is used as a hinge for the valve. It is firmly pressed, throughout the whole length, against the tube, by means of a bar of iron, and a few screws which go through a rib, cast on the tube for the purpose. The part extending on the other side rests on the tube in a place where it has been planed smooth. Every time a train passes over the line, the leather is impregnated with a mixture of tallow and wax, and is pressed by a roller against the tube, on which it sticks, and closes the opening. The closing becomes yet more perfect when a vacuum is made inside the tube, one of the results of atmospheric pressure being then to force the leather against the opening. The piston used by Olegg and Samuda is a cylinder of cast-iron, made to fit by leather rings screwed at each end. This piston is at the end of a horizontal rod 10 feet long, at the other end of which is a cylinder similar to the piston, and which balances it. To the middle of this horizontal rod is fastened a vertical rod, which passes outside the tube through the opening, and is attached to the first car. Between the vertical rod and the piston there is a space 5 feet long, in which there are rollers of increasing diameters, to open the valve gradually. After the ver-

tical rod has passed onward, the valve closes behind it by its own weight, with the mixture of tallow and wax, and a pressure is applied to it by contrivances attached to the car 5 feet behind the driving-rod.—On the three railways above mentioned, on which Olegg and Samuda's valve has been adopted, the tube is placed between the rails, and bolted to the sleepers by means of ribs. The tube extends the whole length of the road, at each end of which are steam-engines and air-pumps of sufficient power to create a vacuum in a short time, and maintain it, whatever be the velocity of the train. The tube is closed at each end by valves of a peculiar construction, which allow the piston to come in and out smoothly, and without letting in the air. Several other arrangements have been proposed, and some means of putting them in practice have been protected by patents. One consists in reversing the valve of Olegg and Samuda, by making it open inside, and propelling by compressed air. Another in laying a closed pipe, of a smaller diameter, along the whole length of the road, and having by the side of it, in the centre of the track, and at equal distances from each other, portions of a propelling tube, with a longitudinal valve. The result is to push the train forward at equal intervals of time, depending on its momentum to make it run over the intervening spaces. In a third plan, the pipes are used to convey compressed air to the cylinders of an ordinary locomotive, deprived of its boiler. This air enters the cylinders, and acts like steam. A fourth plan is to build the pipes of wood, without longitudinal opening, and to make the piston a magnet of sufficient power to attract a second magnet united to the cars, and thus drive them. Several inventors have proposed the use of an air-tight cloth tube, to be placed between the rails, on all the length of the road. This tube is squeezed between 2 vertical rollers, which are under the front car. If compressed air be forced into the part of the tube which is behind the train, the tube will be inflated, and the 2 rollers will be pushed forward, and will carry the cars with them. Several patents have been granted for flexible valves, which never open. The piston is inside, and presses up the flexible valve against a roller attached to the car, and propels the train forward. In another system there are 2 tubes, and no rails. Filling the tube with steam, either to be there condensed or to act by compression, is a plan preferred to filling with air, by some persons. There is also an invention for burning powder in large chambers, and sending the gases produced into the tube, to propel the trains. Several inventors have done away with the longitudinal valve, and replaced it by mechanism. In one of these devices, a rack 80 feet long is attached to the piston, and in recesses cast in the tube, 80 feet apart, there are pinions, the shafts of which pass out through stuffing-boxes. On these shafts, outside the tube, other pinions are keyed, which act on another rack attached

to the cars. It is obvious that the piston and the car being first placed one above the other, when the piston is started, the rack attached to it will make the inside pinions revolve, and that the pinions outside, on the same shafts, will propel forward the rack attached to the cars. The number of patents for atmospheric railways granted during the few years preceding 1847, is 70. During the 10 years which have elapsed since, only a few have been applied for. It is now generally admitted that if atmospheric railways are advantageous, it is only as a substitute for ropes, to pull a train up grades too steep for locomotives. They may accordingly be useful for crossing mountains, without tunnelling, or at the approaches of a city situated on the top of a hill. New circumstances may also occur in which the use of locomotives would be either impracticable or attended with great danger or inconveniences. The proposed tunnel, about 20 miles in length, under the channel, to unite France to England, which has been lately spoken of, is a case. It is obvious that the smoke of locomotives accumulating in such a narrow pipe, with means of egress only at the ends, would make its atmosphere suffocating, and that in such a position the danger from fire would be considerably increased. In the event of such a construction being executed, the money and talents which have been expended on atmospheric railways would prove not to have been wholly squandered.—We will close the subject with a few figures furnished by the engineers who have built atmospheric railways.—LONDON TO OROUDON: The distance is 15,800 yards; the highest grade is 1:100. The inside diameter of the tube is 15 inches. The vacuum made leaves in the tube a pressure of 8 pounds to the square inch. The velocity is 80 miles an hour, with a train of 60 tons. The diameter of the steam cylinder is 40 inches; that of air-pump 57 inches stroke; of both, 4 feet.—PLYMOUTH TO EXETER: Nearly level for 23 miles, where the diameter of the tube is 18 inches; at one place the grade is 1:420; there the tube is 22 inches. The air-pumps are 8 miles apart.—DALKEY TO KILGESTON: Diameter of air-pump, 66 inches; stroke, 65 inches; velocity of piston, per second, 4 feet. The length of the tube is 3,000 yards; its diameter is 18 inches.—NANTERRE TO ST. GERMAIN: This road is built between Montesson and St. Germain. The distance is 3,300 metres (about 3,660 yards); grade, 1:80. The diameter of the tube is 0.63 metres (about 25 inches). There are 2 steam engines of 200 horse-power each. The diameter of the air-pumps is 8 feet; stroke, 7 feet 6 inches. The boilers are tubular, and the draft is produced by a fan-blower. This arrangement enables the engineers to make the machines work to their full power each time a train is to be pumped up, and, by stopping the blower, to keep them lighted without consuming much coal when they have no work to perform.

ATOLL. In the Indian ocean, and in that

part of the Pacific ocean called Polynesia, comprising altogether a space that may be equal to the whole continent of Asia, are found scattered groups of low islands and reefs of rock, of hundreds, and in one instance of 1,000 miles in length, all which owe their existence to the work of the coralline zoophytes. Among these islands are a great many of the form of a ring, being circular reefs of coral, just rising above the waves, and inclosing a sheet of water, which is connected with the ocean by an open passage. These are called by the natives of the Maldives, atolls, or atollions. These annular reefs seldom have a width of more than a few hundred yards. Upon this strip materials are thrown up by the waves, which form a soil; and on this the cocoa-nut trees take root, and send their tall stems far up into the clear blue sky. Under their shelter the Malays build their huts, not always beyond the reach of the waves in the great storms. Each side of the narrow grove is a beach of glittering white sand—the comminuted coral. Within, this is washed by the still waters of the lagoon, which, in the rays of the vertical sun, are of a most vivid green. Without, around the outer margin of the reefs, the never-ceasing breakers raised by the trade-winds curl their snow-white wreaths; and beyond are the dark swelling waters of the ocean. The diameter of the lagoon is sometimes more than 80 miles, and the depth from 100 to 400 feet. The open passage never being on the windward side, affords safe entrance and exit for ships, which find in them still harbors. Outside of the coral reefs, the depth of water suddenly increases to more than 1,000 feet; indeed, between neighboring atolls it is usually regarded as unfathomable. On the edge of this deep water, and in the midst of a sea rolling more heavily than in our temperate regions, the soft, gelatinous coralline animals perfect their structures, and build up out of the calcareous matter they abstract from the sea-water solid ledges, that withstand the most violent action of the waves—monuments far exceeding in grandeur and stability the works of man. The peculiar form of the atolls, and great depth to which the coralline rocks reach, it being ascertained that the animal cannot work in water more than 120 feet deep, are subjects of investigation of no little interest. It has been supposed by Lyell and others, that the lagoons occupied the craters of ancient volcanoes, which had subsided, and that around the edges of these craters the zoophytes had built their structures. But the great numbers and extraordinary size of many of the atolls made this hypothesis quite improbable, and Lyell at last gave it up for the more plausible explanation of Mr. Darwin, which also meets the difficulty of the coral extending to so great depths. This explanation was based on the opinion long before expressed by Lyell, that the bottom of a large portion of the Pacific, where the atolls are found, was slowly subsiding. The reefs of coral, originally

commenced in shallow water along the coast of a continent, and around the shores of islands of all sizes, continued to be carried upward after their foundations have sunk to a greater depth than that in which the zoophytes can live; and after the islands themselves have disappeared beneath the surface of the water. These operations—the sinking of the land and the growth of the coral—like most of the great geological changes, take place slowly and insensibly; but the long periods of time required for the accumulation of the alluvial sediments at the mouths of great rivers, which are included in the most recent geological epoch, suffice no doubt for the formation of these atolls. Were the subsidence not very gradual, the top of the reefs might be carried down faster than the zoophytes could keep them up, and thus they would be lost in the deep waters of the sea. But these operations of nature appear to be planned in harmony with each other, and with reference to the great object, which is accomplished by the coralline animals—the separation from the waters of the ocean of the excess of soluble salts of lime conveyed into them by all the rivers. Their field of operations is this great area of hundreds of thousands of square miles of the tropical seas. In this the islands are all of coral, except occasionally one of granite, which has not yet disappeared, but has its coral reef encircling it a few miles from its shores. That the bottom of this ocean should originally have been of unfathomable depths, with an immense number of elevated points coming up nearly to the surface, on which the zoophytes could commence their operations, and hardly one of these elevations reaching above the waters, is far more improbable in our present knowledge of the instability of the surface, than that a continent has here subsided, and, as its hills disappeared beneath the waters, the reef-builders still kept their structures around these hills even with the surface. The outlet was the original outlet of the surface waters that flowed into the ocean; and the tide rushing in and out has ever afterward served to keep it open. The material of the reefs is not all coral. With this are intermixed alternating beds of the numerous shells, which abound in these seas. The lower portions of the structures are filled in with a great variety of organic remains, and with fragments of coral. By the action of the waves, the solid substances are ground into fine calcareous mud, like that produced by chalk. This is packed into the crevices of the dead coral below, and the mass becomes solid and compact as the coralline limestones of ancient rock formations. While over the bottom of the lagoons, and of the neighboring ocean, the same insoluble sediment is spread, building up layers of rock, that will probably not differ much from the chalk found along the English coast.

ATOMIC THEORY. Theory may be defined as explanation of phenomena, and of course presupposes the most intimate and ex-

tensive acquaintance with facts. As these multiply, we demand to know how they are related and caused, or the reasons why they exist as we find them. In the case of chemistry, the facts and laws of combination were first established. We are chiefly indebted for these to the introduction and perfection of the balance. It results from innumerable weighings, that chemical composition is definite; that is, the same compound substance has exactly the same constituents in the same proportions. The composition of water, for example, is definite and unchangeable. It consists of 8 parts by weight of oxygen, to 1 by weight of hydrogen. Its constitution is fixed and constant, and may therefore be numerically expressed. So potash consists of 39 parts by weight of potassium, and 8 of oxygen. Common salt contains 35 parts of chlorine, to 23 of sodium. When we analyze them, we get these quantities; when we produce them, we use these quantities. And not only water, potash, and salt, but all chemical compounds, are put together in obedience to certain fixed laws of proportion, different in different substances, but invariable in the same kind of compound. We are thus to regard all forms of matter as mathematically constituted. Not only are the elements bound together in a quantitative order, in the stable condition of substances, but when a compound is broken up, and its elements released from their affinities, they cannot escape the law of numerical destiny; they rush into new unions, but still in definite proportions. These proportions are so well established, that scales are formed of combining numbers, opposite each element being placed the number which governs it in all cases of its combination. Thus the number associated with oxygen is 8, which accompanies it in all its alliances. It combines with carbon, 8 oxygen to 6 carbon, to form carbonic oxide. Another 8 of oxygen may then be added to carbonic oxide, producing carbonic acid. The proportion of oxygen in carbonic acid is a multiple by 2 of that in carbonic oxide. This affords an illustration of what is called multiple proportions. In nitrous oxide we have nitrogen 14 to oxygen 8. In nitric oxide, nitrogen 14 to oxygen twice 8, or 16. In hyponitrous acid there is nitrogen 14 to oxygen 8 times 8, or 24. In nitrous acid, we find nitrogen 14 to oxygen 4 times 8, or 32; and in nitric acid there is nitrogen 14 to oxygen 5 times 8, or 40.—These quantities, or combining numbers, though widely variable in the several elements, are equal in chemical power. One of hydrogen unites with 8 of oxygen in generating water, but the oxygen is not therefore 8 times superior to the hydrogen in neutralizing or saturating power, or effective value; they are exactly equal, and the quantities taken are hence called equivalents. This equivalency is universal and reciprocal. The proportions with which any 2 bodies combine with each other, is that in which they combine with every other. When 2 bodies combine with a third, as

they are both equivalents of the third, so they are also equivalents of each other, and unite together in exactly the same proportions. Thus 1 part of hydrogen combines with 8 of oxygen, and 35 of chlorine combine with 8 of oxygen; but 35 of chlorine is the very quantity that combines with 1 of hydrogen. Thus a single combining or equivalent number attached becomes the exponent of its chemical power in all cases of its combination. The numerical laws of combination apply to compounds as well as to elements. Thus the equivalent for carbonic acid is carbon 6 and oxygen twice 8 = 22; for lime it is calcium 20, oxygen 8 = 28. Carbonic acid and lime therefore unite 22 to 28 to produce carbonate of lime or marble.—The facts of chemical combination, thus briefly stated, are the results of experimental investigation, and are independent of all speculation or hypothesis. But the human mind is not satisfied with the bare expression of facts. It seeks for explanations—for the hidden causes of phenomena—for principles which will account for the effects. There are undoubted reasons why chemical combination occurs in the mode we have indicated. There must certainly be causes which determine combination in these fixed ways, and prevent it from taking place otherwise. The atomic theory offers a reason—assigns a cause. The term atom, signifies a portion or particle of matter, exceedingly small, and not capable of being divided. The atom, as conceived by the chemist, is an amazingly minute but indestructible and unchangeable particle, and all matter is believed to be made up of these. In ancient metaphysical speculation, matter was held to be infinitely divisible. They said, we cannot conceive particles so small, that, if possessing weight, bulk, and figure, they cannot be halved or divided into lesser quantities. Without denying that atoms may be conceived as infinitely divisible, the chemist assumes that, in point of fact and in nature, their divisibility has a limit.—The strength of the faith of modern chemists in the existence of atoms, may be well illustrated by quoting the language of Liebig: "Without disputing the infinite divisibility of matter, the chemist merely maintains the firm and immutable foundations of his science, when he admits the existence of physical atoms as a truth entirely incontrovertible." The atomic theory of chemistry was announced early in the present century by Dr. Dalton, of Manchester, England. Starting with the doctrine that matter consists of ultimate impenetrable and imperishable particles, he teaches: 1, that all the atoms of the same element possess exactly the same weight; 2, that the atoms of different elements possess different weights; and 3, that the number that indicates the weight of the atom of any element, is the same as the combining or equivalent number for that element. For the vague conception of abstract proportion, there is substituted the distinct idea of a solid ponderable atom. Its weight, compared with oth-

er atoms, is its combining number. One is to be considered stamped upon every particle of hydrogen, as if the whole amount of it in the globe had been coined in the same mint into pieces of exactly the same value. Carbon, in like manner, is supposed to have its atoms stamped with 6, oxygen with 8, sulphur with 16, &c.—This gives a rational and most satisfactory explanation of the laws of combining proportion; they follow as its necessary consequence. For if water be formed by the combination of oxygen with hydrogen, atom to atom, then its composition must be definite and constant. Again, if the atoms of each element possess immutable weights, they must in all their combinations exhibit equal and reciprocal values. Replacement or exchange can only take place in equivalent proportion. Multiple proportions also result directly from the unity of atoms. As the least quantity of an element in combination can be increased only by the addition of whole atoms, so the number expressing the higher quantity must be an exact multiple of the single atomic number. No fractional quantity of any element or substance can be added, because the combining atom cannot be fractured. This view offers such eminent advantage, both in the acquisition and retention of chemical knowledge, that it has been universally adopted.

ATOMS, according to the hypothesis of some philosophers, minute, indestructible, and indivisible particles of matter. This speculation began in early Greece, and has found supporters down to the latest times. Dalton's discovery of the law of definite chemical proportions has rendered the language of the atomic theory popular among the moderns, because the facts of chemistry are more easily expressed by it; just as Leibnitz's false language of infinitesimals is more readily used than Newton's true language of fluxions. But many of those who now speak of atomic weight and of atoms, signify by the latter word the centres from which physical forces act, without meaning to decide whether those forces reside in the will of the Creator, in a monad, or in an atom. See *Atomic Theory*.

ATONDO Y ANTILLON, Isidoro, a Spanish admiral of the 17th century, distinguished in connection with the annexation of lower California to Spain. He proposed to the Spanish government to defray the expenses of an exploring expedition to lower California, which sailed, under his command, May 18, 1683, with 2 vessels, a crew of 100 men, and 8 Jesuits from Chacala, and landed at La Paz after a fortnight's sail. Atondo immediately set out for the interior, but came into collision with the Guaxores Indians, who refused to supply him with provisions. He was obliged to depart, but after having put in at Cinaloa and supplied himself with stores, he returned to the Californian coast, and effected his purpose by getting hold of an extensive bay in lat. $26^{\circ} 30'$, which he called St. Bruno. Next he built a church, and

took formal possession of lower California in the name of Spain. The missionary exertions of the Jesuits were rather successful, as they induced 600 Indians to join the church of Rome, but the general features of the country were not encouraging. The soil was barren, and Atondo returned to Spain after having brought his vessels, men, and the 8 Jesuits safe back to Mexico. The colonization of the new country was not fully accomplished until after the expedition of Francisco de Hamarra, in 1694, when Salva Tierra and Father Kino, one of the Jesuits of the first expedition, completed the work begun by Atondo.

ATONEMENT (at-one-ment, reconciliation), a word used by the old English writers to express the closing of a breach between two alienated persons. Thus in Shakespeare,

He seeks to make atonement
Between the duke of Glo'ster and your brothers.

Further, the agency by which the discord is removed, the act of reparation or satisfaction rendered for an offence committed or an injury done, was called the atonement. Thus Johnson uses the verb, "By what propitiation shall I atone for my former gravity?" In a theological sense the word is employed to describe the restoration of harmony between man and God, and the means by which that restoration is effected. In this application the term has been narrowed still more, being technically confined to one peculiar mode of restoring the union between man and his Maker, namely, the expiatory sacrifice made by Jesus Christ. The doctrine of atonement, of a reconciliation brought about between the creature and the Creator, through the agency of expiatory suffering, was common to all the ancient religions. It was founded on the dread of the divine vengeance, prompted by the consciousness of ill desert, which seemed to remove the Deity to a great distance from the human soul, and to change his aspect from clemency to wrath. Sensible of an interrupted communion with the Infinite, and feeling themselves to be objects of displeasure, men thought to reinstate themselves, and to recover the forfeited favor of heaven by expiatory rites and sacrifices. The Hindoos sought to placate the Deity by the blood of animals, and even resorted for this purpose to the offering of human victims. The Bramins laid the sins of the people upon the head of a horse. But the blood of man, as being the highest of creatures, was deemed the noblest propitiation, the more efficacious if poured forth freely. He that immolated himself was supposed to expiate not his own sins only, but also those of his kindred. The self-devotion of a great personage, of a king or a priest, was sufficient to make atonement for a nation's guilt. The Chinese entertained the same belief, that they could by timely sacrifices of fruit, grain, or living creatures, bestial or human, avert the calamities which, in their judgment, expressed the wrath of heaven against their sins. Herodotus, speaking of the Egyptians, says, that

they who offer sacrifices solemnly invoke curses upon the victim, imploring that any evil menacing them or the land of Egypt, might be turned upon these devoted heads.—The traditions of Greece and Rome abound in examples of human sacrifices brought as victims or self-dedicated, to avert public calamity and to pacify the wrath of the gods. And after human sacrifices were prohibited, the belief in the propitiatory efficacy of blood entered into the less barbarous sacrificial observances of the historical periods. The heroic self-devotion of Greek and Roman generals was dictated by the persuasion that the free-will offering of their lives would save the army from destruction. Cæsar, writing of the Gauls, observes: "The whole nation is excessively addicted to religious observances, so much so, that persons who are afflicted by the severer maladies, or who are exposed to perils in battle or elsewhere, either slaughter men as victims, or devote themselves to death, believing that unless life is rendered for life, the immortal gods cannot be appeased."—The sin-offerings of the Hebrews had, according to the best authorities, a similar expiatory significance. They were brought to propitiate an offended Jehovah. The victim was regarded as a substitute for the sinner, who laid upon it the doom he has incurred himself. Thus in Levit. xvii. 11, it is declared: "The life of the flesh is in the blood, and I have given it to you upon the altar to make an atonement for your souls. For it is blood that maketh atonement for the soul." The sprinkling of the blood in the case of a sin-offering, indicating the utter dissipation of the life that dwells in it, contains the idea of the substitution of the victim's life or spirit for that of the offender. The belief in a propitiation of the Deity through vicarious sufferings is frequently expressed in the Jewish Scriptures; as, for example, 3 Sam. xii. 15, xxiv. 10; Isaiah liii. 4. The notion of transferred or imputed guilt is also distinctly conveyed in passages like these: Deut. ch. xxi; Jerem. xxxiv. 18; Levit. xvi. 21; Isaiah xliii. 8. Among the Hebrews propitiatory or atoning sacrifices were steadily offered for the whole people at the New Moon, the Passover, Pentecost, the Feast of Trumpets, the Feast of Tabernacles, and the great day of Expiation. They were offered for the priests and Levites at their consecration, and for the high-priest on the day of Expiation. They were also offered on occasions of purification, which were very numerous. The Christian doctrine of atonement, according to which Christ, by the offering of himself, has obtained the forgiveness of human sins, connects itself with the older religions, and especially with that of the Jews. Into an explanation of the several views taken by Christians of the way in which this reconciliation has been effected by the Savior, we cannot here, with propriety, enter.

ATONY (Gr. *a* privative, and *tonos*, tone or force). This term is applied to a want of force or tonicity in the organs, tissues, and fibres of

the body. It is an incipient state of weakness and debility, which, when more developed, is termed "asthenic," or feeble and unhealthy. Atony in the fibres of the body is analogous to indifference in the mind. It is not fatigue alone, or positive weakness and disease, but a state of comparative inertness and insensibility, arising from depressed vitality, especially in the contractile fibres. Lassitude is a temporary want of tone and power in the organs and the tissues of the body; atony is a continuous want of tone and power. When lassitude is not repaired by rest, and nourishment, and sleep, in usual proportions, there is atony, or incipient weakness and debility; and where this state continues long, disease ensues, or that kind of unhealthy weakness which accompanies a want of power to make pure blood, and want of vitality and tone enough in the organs to carry on the functions of nutrition from the blood when made. This is the asthenic state, and may be either the forerunner of a serious disease, or the result of long-continued suffering and confinement. Where atony is the result of inactivity, too much confinement at home or in bed, with indulgence in good food and stimulating beverage—a wet sheet or a shower-bath every morning for a time; early rising and exercise in the open air; temperance and moderation in diet, with useful occupation for the mind, will generally bring back tone to the whole organism and health to mind and body; but where excessive labor and prolonged anxiety produce atony or indifferent nutrition and tonicity of fibre in the organs, a more careful, gentle, and continuous treatment is required to restore the feeble and depressed vitality to its normal state. Rest of body and peace of mind are absolutely indispensable, as well as moderate diet, exercise, and recreation. Travelling and change of scene and climate are often useful in restoring health and strength in cases of debility of this peculiar nature.

ATOONI, or **ATUNI**, a tribe of Bedouin Arabs, between the isthmus of Suez and the valley of Kosseir.

ATRATO, a river of New Granada, South America. It rises near lat. 5° N., and pursues a nearly due north course for more than 800 miles, to its mouth on the shores of the gulf of Uraba, or Darien. It is a river of some interest, from the fact, that the bar at its mouth being crossed, it has a wide channel not less than 85 feet deep for the first 96 miles above its mouth, with a fall not exceeding 2½ inches to the mile, and that for 43 miles further, a channel exceeding 18 feet in depth can be obtained with little expense; while the distance across to the Pacific ocean, from which the river is separated by one of the lowest ridges of the Andes, does not exceed 80 miles, or thereabouts, and branches of the Atrato from the west are stated to almost meet others from the Pacific, which head in this dividing ridge. Examinations were made in the year 1852, by Mr. John C. Trautwine, of Philadelphia, civil

engineer, of several routes across the mountain ridge, with the view of determining the practicability of constructing a ship canal by this river, to connect the Caribbean sea with the Pacific. His report was, that any such undertaking would be Quixotic in the extreme; and that he could "not entertain the slightest hope that a ship canal will ever be found practicable across any part of the ridge." The statements of the low height and easy passage across the mountain at various points, he found to be greatly exaggerated, though it is true that at the pass of the San Juan river, a branch of the Atrato, canoes are carried over with great labor, after being brought with the greatest difficulty up the rapids at the head of canoe navigation. Notwithstanding this report, an expedition was despatched by the United States government in October, 1857, under the direction of Lieut. Craven of the navy, and Lieut. Mickler of the army, to explore the same route. They left Carthagena on the 5th November, and are expected to report to the government on their return in the spring of 1858. The Atrato for nearly its whole length runs through a low swampy region, which in times of freshet is entirely overflowed. At ordinary stages of the water, the river runs between levees, which are a few feet higher than the swamps behind, and through which in low stages the swamp water is seen trickling down among the accumulation of leaves and branches which, mixed with black mud, make up the banks of the river. Not a stone is to be found from the mouth to the head of canoe navigation. The first signs of cultivation are met with 60 miles up the river, at the mouth of the Suoio, but the improvements are of the meanest description; and nothing better is found for 40 miles further. Quibdo, in lat. 5° 45' N., is the only town of any consequence on the river. It is a miserable place of 1,500 inhabitants, mostly blacks, with some Indians and a few whites. It is situated on several isolated hillocks of gold gravel and clay, in the midst of the swampy region, which extends all around. Many of its inhabitants, who have never left the place, have never at any one time walked a mile in the course of their lives. The temperature of the region is excessively close and sultry, and the rainy season continues all the year, not 20 days probably passing in the whole year without rain. The comforts and even necessities of civilized life are almost entirely wanting; while the numerous disagreeable and annoying features connected with tropical life, are here met with in the highest state of perfection. Gold is found in fine dust in the beds and banks of the Atrato, at and above Quibdo, and also of the different branches of the river. It is particularly abundant on the western slopes of the Cordilleras, east of the Atrato. Some portions of the country are described as of exceeding richness in gold, so that it is not unlikely this region may become at some time a favorite gold-mining district; but at present the difficulties of procuring the necessities of life, and the

discomforts of the climate, are of too serious a nature for foreigners to resort to it. The gold yearly brought to Quibdo, and sold by the natives to the merchants, amounts to about \$900,000. Platinum is also found in some of the provinces of this region, and in districts further east, mines of silver and copper have been worked. Near Bogota are the celebrated emerald mines of Mussa. Above Quibdo, the river Atrato receives several branches, of which the Quito is the most important. Were it not for the incessant fluctuations of this stream, which within a few hours frequently reduce it from its ordinary ample channel depth of 7 feet or more to 5 or 6 feet, or even less, the Quito would present, with the Atrato, an uninterrupted steamboat thoroughfare of no less than 252 miles from the gulf of Darien. This stream is wholly in the gold region, and its branches appear to lie in the richest portion of it. Mr. Trautwine is of opinion that the gold region on the western slopes of the Cordilleras in New Granada, covers some 2,000 square miles, over which gold is now constantly collected almost indiscriminately as regards choice of locality; and that the exportation of it from the eastern slopes of the same range annually amounts at this time to some millions of dollars—these exportations being through Carthagena to England and France. The great river Magdalena, and its tributary, the Cauca, alike with the Atrato, reach this gold region.

ATREBATES, a people in Gallia Belgica, whose name appears in the modern Artois. They formed a confederation against Cæsar, and furnished a contingent of 15,000 troops. A colony of them settled in Britain. They resided in the modern Oxfordshire and Berkshire.

ATREUS, a celebrated prince, chief, and hero, of the heroic and tragic ages of Greece. In the Homeric poems, he and his ancestors, the Pelopides, are spoken of, merely, as hereditary hero kings of the Peloponnesus, and he especially as the grandfather of the Atridan brothers, on whose account the war against Ilium was undertaken; without any reference to the horrible tragedies of incest, adultery, murder, matricide, and all unnatural and unutterable horrors, which are ascribed to the fated race by the tragic poets, to whom the awful reproductive crimes and horrors of this doomed family have afforded more subjects than any other similar or secondary legend. To no other family, in Grecian mythology, does so horrible a legend as this attach, though many are full of almost unimaginable horror; especially that of the Labdacids of Thebes, which comes the nearest to this of the Atrides of Argos, embracing, like it, the crimes of incest, parricide, and fratricide, each arising out of the last preceding crime, and, in the latter stages, inevitable and involuntary in the actors; who are represented as predestined, and driven by a blind necessity to the commission of new crimes, which are both the punishment and the expiation of the ancestral guilt, in the first instance, and which are yet im-

puted as deadly sin to the perpetrators, who are innocent of every thing except being the playthings, tools, and victims of an inevitable destiny.—In this legend, the first crime is that of Tantalus, who slew, cooked, and served up, at a solemn banquet, given to the gods, his own son Pelops, in order to test their omniscience. Tantalus being duly punished, and Pelops resuscitated, the victim of the paternal crime, after winning and marrying the beautiful Hippodamia, and having by her two sons, Atreus and Thyestes, further aggravated the ancestral curse and crime by the murder of Myrtilus, son of Mercury, who, in his divine vengeance, enforced all the woes which followed on the fated races.—Atreus, the elder brother, had by his first wife a son, Plisthenes, who married Aërope, and had by her two sons, Agamemnon and Menelaus, known, from their father's patronymic, as the Plisthenidæ—from that of their grandfather, by whom they were educated until manhood, as the Atridæ. On the death of Plisthenes, Atreus married the widow of his son, Aërope; and she was shortly afterward seduced by her husband's brother, Thyestes, who, on the discovery of his foul adultery, fled for safety to Sicily, in Theoprotia, where dwelt, unknown to him, his own daughter Pelopia. To her, meeting her casually by night, ignorant who she was, he offered violence; in consequence of which she bore a son, Ægisthus, to her own father. In the mean time, twin children were born to Aërope, the offspring of her adultery with Thyestes; and these, having induced his brother to return home, on pretence of pardon and reconciliation, Atreus slaughtered, cooked, and served up to their father—a repetition, it is to be observed, of the cannibal Pelopidean feast—exhibiting their heads to him, in proof of the nature of his unnatural meal. Next to this horror, Atreus unknowingly marries Pelopia, pregnant of Ægisthus, who is exposed at his birth, miraculously preserved, and afterward recognized by his mother, who at the same moment recognizes her crime, involuntary as it was, and instantly avenges it by committing suicide with the very sword of her own father, which she had snatched from him in the moment of her struggle with him, and which he had at once challenged as his own, seeing it in the hands of his son to whom Pelopia had given it. During the occurrence of these events, the Atridæ, Agamemnon and Menelaus, had married, respectively, the half sisters Clytemnestra and Helen, the former daughter of Tyndarus, the latter of Jupiter, and Leda. Helen, seduced by Paris, son of Priam, king of Troas, flies to Ilium, and the Trojan war ensued. Agamemnon being elected the chief of the confederate kings, landed to avenge his brother's wrongs, and to redeem the captured beauty. During his absence, Ægisthus, being left guardian of the palace, kingdom, wife, and treasure of Agamemnon, seduces the queen; and on the return of the king, victorious after the ten years' siege and the fall of Troy,

they murder him conjointly in his bath, justifying the deed, as if it were an act of lawful retribution, for the death of his own and Clytemnestra's daughter Iphigenia, whom he had sacrificed, at Aulis, to Minerva Polias, in order to propitiate the storms, and secure the sailing of the wind-bound host. The last act of this fearful tragedy is the slaying of Ægisthus and the matricide of Clytemnestra, by her son Orestes, who avenges his father thus, at the express instigation of the oracle of Apollo; for which deed he is hunted by the furies, until he is, at length, acquitted by Minerva in a solemn trial, held on the Areopagus, and purified by lustrations in the temple of Apollo, which ceremony in the end breaks the thread of fate and terminates the ineffable sins and sorrows of the house of Atreus. This frightful story is evidently post-Homeric in its origin; and, being evidently mythical from beginning to end, it is difficult to conceive how such a tissue of horrors should ever have been conceived or imagined by any human brain. It seems, however, to bear internal proof of being an *ex post facto* tale, manufactured as evidence of the truth of a preconceived superstition, or doctrine, concerning inevitable destiny, involuntary reproductive guilt, sin begetting sin, and punishment punishment *ad infinitum*. On this account only, and for this curious consideration, is the horrid and revolting tale worthy to be preserved from oblivion, coupled with the singular influence which it possessed on the mind of the Greek tragedians, all of whom wrote many dramas on this odious subject; and with the fact that the grandest of all their extant works, the Oresteian trilogy of Æschylus, is the relation of the closing acts of the long tragedies of the Atridæ.

ATRI, a town in the Neapolitan province of Abruzzo Ultra I., situated on a steep hill, 4 miles from the Adriatic, and 18 miles S. E. of Teramo; pop. 8,600. It contains a cathedral, and several convents. The town is built on the site of the ancient Hadria, an old Roman colony rebuilt by the emperor Hadrian, whose family originally dwelt there. Traces of the old walls of the town are still visible, and mosaic pavements and other relics of the past have been excavated.

ATRIP, in sea phraseology is applied indifferently to the anchor or the sails. The anchor is atrip when it is drawn out of the ground in a perpendicular direction by the cable or buoy-rope. The topsails are atrip when they are hoisted up to the mast-head or to their utmost limit.

ATRIUM: I. In Roman architecture, the central room of the house, also called *cœnum adium*. In this room the family lived and eat together; here the lady of the house sat at work with her maidens; here the clients assembled, and here stood the *laræ* and *penates*. The room was uncovered in the centre, toward which the roof sloped, to throw the rain-water into a cistern in the floor of the room, around which stood the household deities. II. The

forecourt of a temple. The *atrium* of the temple of Libertas is most frequently mentioned. III. In ecclesiastical architecture, it denotes an open space before a church, making part of the narthex, or ante-temple. Penitents and others, not allowed to penetrate nearer to the church, stood in the *atrium* to solicit the prayers of the pious in their behalf.

ATROPATENE, in the remotest antiquity, according to Gürras, was the name of the country between the lake of Spauts or Ooroomayah and the Caspian sea, bounded on the N. by the river Koor, the ancient Cyrus, and on the S. by the Mardus, or Amardus, now Kizil-Oozen. In the theory which considers the Caucasus as the cradle of the human family, the branch from which the Medes were descended primitively occupied this region. Now it forms a part of Russian Armenia, and the Persian province, Azerbaijan. The writers of classical antiquity, like Polybius and Ammianus, mention an Atropatene as a province of Media proper, and praise its fertility.

ATROPHY (Gr. *a* privative, *τροφή*, nourishment, *τροφή*, want of nourishment). This word is technically used to signify the wasting away of any organ or portion of the body from want of nutrition in the part, irrespective of the general nutrition of the body; as the natural decay or shrinking of the reproductive organs in aged persons, even when the body generally may become more corpulent. The principle of vitality decreases in the organ, when the functions are suspended, and nutrition slackens where the vital principle becomes inert. The mammal glands, or milk-secreting organs in the breasts of women who have passed the age of child-bearing, are sometimes so much atrophied that traces of them only can be found embedded in large lobes of adipose tissue or fat.—In man these glands are only rudimentally developed, their functions being never active, and, therefore, they are not, properly speaking, atrophied, but rudimental and inert, which is, in a contrasted view, analogous to atrophy. Another contrast, which is not analogous, but very different, is technically called hypertrophy, or excessive nutrition and enlargement of an organ, or a set of organs, in the body. This also may be natural, where the vital functions are increased for special purposes at times, as in the pregnant womb, the walls of which become enlarged in thickness and distended in volume, to subserve the temporary uses of gestation and parturition.—The active and continuous exercise of any set of muscles in the body, will increase the relative proportions of nutrition, and produce enlargement of the organ, as is seen in the arm of the blacksmith, the leg of the operadancer, and the whole external frame of certain acrobats, wrestlers, and athletes. Such enlargements, however, being normal and continuous, arising from increased exercise and consequent nutrition, are not technically termed hypertrophy; while the temporary enlargement of the pregnant womb, though natural

and normal, being also more or less contingent and accidental, comes within the technical application of the term. In these cases both atrophy and hypertrophy are natural and normal, but in many other instances they are the result of accident or of disease. If any limb or portion of a limb be artificially compressed for a long time, as the feet of Chinese women are compressed in narrow shoes to check their growth, such limb or portion of a limb, deprived of natural exercise and room to grow, will be depressed in its vitality, and lack the power to appropriate nutrition from the blood; it will gradually decay in size and force, and become what is technically termed atrophied. Disuse alone, without compression, will cause atrophy in the upper or the lower limbs, or even in the whole body; for many persons waste away from morbid inactivity, which brings on by degrees emaciation and debility, resulting in decay of the whole system.—Paralysis, by preventing natural exercise in the limbs, may depress the vitality of the parts, and diminish their powers of nutrition. This will cause atrophy, or a falling away of the paralyzed limb. The dislocation of a joint neglected, may, by causing pressure on the nerves, cut off a portion of the innervation necessary to maintain the active functions of nutrition in the parts below, and thus depress vitality and bring on atrophy. In children of a scrofulous diathesis, disease in the hip-joint often affects the nerves of the parts and the vitality of the whole limb, diminishing the powers of nutrition, and causing the leg to dwindle in comparison with the one which is not affected. In these cases the atrophy is of a double nature; for the gluteal muscles waste away, and the bones decay in part, before the limb begins to dwindle in its general proportions from the weakened powers of nutrition. Atrophy is always the result of diminished vitality and function, and consequent decrease of the powers of nutrition. The term is generally applied to single organs, limbs, or portions only of the organism, emaciation and decay being used to designate a wasting away of the whole body.

ATROPIA, ATROPIN, ATROPINE (Gr. *atropos*, one of the Fates, whose office it was to clip the thread of human life), a vegetable alkali of highly poisonous properties extracted from the *atropa belladonna*, or deadly night-shade. It is obtained from the juice expressed from all parts of the plant, but more particularly from the leaves. It crystallizes in white silky prisms, which have a bitter taste, but no smell. They possess an alkaline reaction, reddening litmus paper; they melt at 194° F., and are volatilized at 284°. Their composition is carbon, 70.98; oxygen, 16.36; hydrogen, 7.83; and nitrogen, 4.83. The smallest quantity of this substance, applied to the eye, causes dilatation of the pupil, which continues for several days. In this country the juicy extract of the belladonna is more used in medicine than the alkaloid; and

its properties will be found treated of under *BEKLADONNA*. Atropia was first obtained by Meis, a German apothecary, by digesting the roots, powdered extremely fine, for several days in alcohol, and afterward separating the other ingredients by various precipitations. From 12 ounces of the root he obtained 20 grains of pure alkali. Chloroform and potassa are also used for obtaining its solution.

ATROPOS, one of the Fates of Greek mythology. She is represented with a pair of scales, or a sun-dial, or a cutting instrument.

ATTACCA, a musical term derived from the Italian *attacare*, to attack, and written at the end of a piece of music to show that the succeeding movement is to be performed without any pause. Thus, *attaca l'allegro* is placed at the end of an *adagio* which is immediately followed by an *allegro*.

ATTACHMENT (Fr. *attacher*, to seize), in law, the seizure of the person or property. The writ of attachment is of 2 kinds: 1. Against the person in the nature of a criminal proceeding for contempt of court. It may be issued against attorneys, solicitors, sheriffs, and other officers of court, for any misconduct or neglect of duty. The object of the attachment is in such cases to bring the offending party personally into court, to answer for the alleged contempt, and unless he can clear himself he is punishable by fine or imprisonment. Jurisdiction has formerly been exercised by courts over a very large class of cases, and no precise limit has been fixed to the power. The statute of New York continues the jurisdiction to the same extent that has been heretofore used. 2 R. S. 534. In the famous case of Yates in New York, in 1810, who was committed to prison by the chancellor for misconduct as a master, the question was agitated but not definitively settled whether there was any relief upon habeas corpus from such imprisonment. *People v. Yates*, 4 Johnson's Rep. 317, 4 id. 337. 2. A writ as for contempt to enforce the civil remedies of parties to suits, or to protect the rights of such parties. In the English chancery this was the only process for enforcing its orders and decrees. In this country it has been resorted to by all the courts to enforce interlocutory orders. It is, however, no longer used in New York for the collection of costs or any money demand, except against attorneys, solicitors, and other officers of court. Act of 1847.—Attachment against property was an old mode of proceeding in English practice to compel the appearance of a defendant in an action. To this head belongs also the proceeding known as FOREIGN ATTACHMENT, a process under which the property of a foreign or absent debtor is seized. The proceeding had its origin in a custom of the city of London, of which we find some notice in the books as early as the reign of Edward IV. By this custom, an action having been brought in the mayor's court against A, and the suit having

been returned *nulli* (that is to say, that nothing could be found as a distress to compel appearance of defendant), and thereupon, it being suggested by the plaintiff that another person residing in London is indebted to A, a writ is issued to warn such debtor, who is thereafter in the proceedings called "garnishee," and if he does not deny that he is indebted, the debt is, by virtue of such writ, attached in his hands to answer the judgment which shall be recovered against A. Cowell defines a foreign attachment to be "an attachment of foreign goods found within a liberty or city in the hands of a third person for the satisfaction of some citizen to whom the said foreigner oweth money." But there is no trace of such proceeding in any other place in England than London. This proceeding has been introduced into our eastern states and some others, and is a common mode of collecting a debt due by a non-resident who has property within the state, such property, whether lands, chattels, or debts due to him, being seized at the commencement of the action to satisfy the judgment which shall be recovered. It is sometimes called trustee process, and the person who is indebted or holds property of the non-resident defendant, being designated as trustee. In the state of New York an attachment may, by the code, issue against the property of a non-resident defendant who cannot be served with process, but the proceeding is more simple than the trustee process of the eastern states. There is also a distinct proceeding for the attachment of property of absconding, concealed, absent, or non-resident debtors, which is not an action but a sort of insolvent proceeding for the benefit of all the creditors of the person whose property is attached.

ATTACK, in its general, strategical meaning, is held to signify the taking of the initiative in any particular skirmish, combat, engagement, or pitched battle; in all of which one party must necessarily commence with offensive, the other with defensive, operations. The attack is generally considered the more successful, and consequently, armies acting on the defensive, that is to say, in wars of a strictly defensive nature, often initiate offensive campaigns, and even in defensive campaigns deliver offensive actions. In the former case, the object to be gained is that the defending army, by shifting the place and scene of operation, disturbs the calculations of the enemy, takes him away from his base of operations, and compels him to fight at times and places different from those which he expected, and for which he was prepared; and perhaps, positively disadvantageous to him.—The two most remarkable instances of offensive operations and direct attacks, used in strictly defensive campaigns, occurred in the two wonderful campaigns of Napoleon: that of 1814, which resulted in his banishment to Elba; and that of 1815, which was terminated by the rout of Waterloo and the surrender of Paris. In both these extraordinary campaigns,

the leader, who was acting strictly in the defence of an invaded country, attacked his enemies on all sides, and on every occasion; and, being always vastly inferior, on the whole, to the invaders, contrived always to be superior, and generally victorious, on the point of attack. The unfortunate result of both these campaigns detracts nothing from the conception or the details of either. They were both lost from causes entirely independent of their plan or execution, causes both political and strategical, the principal of which were the vast superiority of the allied means, and the impossibility that any one nation, exhausted by wars of a quarter of a century, should resist the attack of a world in arms against it. It has been said that when two armies are set face to face in the field, that army which takes the initiative, or in other words, *attacks*, has the decided advantage. It would appear, however, that those who have adopted this view, have been dazzled by the splendid achievements of a few great generals, and of one or two great military nations, which have owed their successes to attacks on the grandest scale; and that the opinion requires much modification. Epaminondas, Alexander, Hannibal, Cæsar, and, last not least, Napoleon I., were, emphatically, attacking generals, and won all their great victories, as, in the main, they endured all their great reverses, in actions wherein themselves assumed the initiative. The French owe every thing to the impetuosity of their almost irresistible onset, and to their rapid intelligence in following up successes and converting disasters, on the part of their enemy, into irretrievable ruin. They are by no means equal in the defensive. The history of the greatest battles in the world seems to show that, where the attacked army has solid and obstinate endurance sufficient to make it to resist, unbroken, until the fire of the assailants begins to die out, and exhaustion and reaction to succeed, and can then assume the offensive and attack in its turn, the defensive action is the safest. But there are few armies, or, indeed, races of men, who can be intrusted to fight such battles. Even the Romans, though magnificent in the defence of walled towns, and wonderful in offensive field operations, were never celebrated in the defensive; and their history shows no battle in which, after fighting all day under reverse and on the defensive, they in the end attacked and won. The same is generally characteristic of the French armies and leaders. The Greeks, on the contrary, fought many of their best battles, as those of Marathon, Thermopylæ, Platæa, and many others, but the latter especially, on the plan of receiving the assault until it slackens, and then attacking the half-exhausted and surprised assailants. The same has been the English, and, to a great extent, the Swiss and German system for many ages, and generally successful with those troops, as it has been in later days with the Americans. The battles of Crecy, Poitiers, Agincourt, Waterloo, Aspern and Es-

ling, and many others, too numerous to be recorded, were fought exactly on the same principle; and it may be added that in the war of 1812-'14, the Americans successfully retorted on the English, who almost invariably attacked them, and that too—contrary to their usual mode—in column, the plan which they had proved to be so valuable against the French, and which they have still more recently proved against the Russians.—The ordinary modes of attack are the following, when two armies are opposed face to face, in the field, and when both intend to fight. First, and simplest, the direct parallel attack, when the assailing force joins battle, at once, along the whole front, from wing to wing, and fights it out by sheer force. Second, the attack by the wings, either on both simultaneously, or on one first and then on the other, successively, keeping the centre retired. This was Napoleon's favorite battle, by which, having caused the enemy to weaken his centre in order to strengthen his wings, while he kept his own centre retired and fortified by immense reserves of cavalry, he finally rushed into the central gap and finished the action with an exterminating blow. Third, the attack by the centre, keeping the wings retired and in reserve. This is the most faulty of all attacks, and has rarely been adopted, and, it is believed, never successfully. If an army be forced into this position, it is generally surrounded and annihilated, as was the Roman attacking army at Cannæ. It is, on the contrary, an admirable position of defence. Fourth, the oblique attack, invented by Epaminondas, and practised by him, with splendid success, at Leuctra and Mantinea. It consists in attacking one wing of the enemy, with one wing secretly and successively reinforced, while the centre and other wing are retired, but are so manœuvred as to threaten a constant attack, and prevent the defending party from strengthening its own weak point, until it is too late. This was the favorite method of the Austrian Clairfait, by which he constantly defeated the Turks; and of Frederic the Great, who was wont to say that "he was only fighting Epaminondas his battles over again," in his own finest victories. It is worthy of remark that the Greeks, the French generally, as well as the Russians and the Austrians, have gained all their best battles by attack of columns; which, when they are not effectually checked and brought to a stand, break through the centre and carry all before them. The Romans, the English, and the Americans, almost invariably, have fought and still fight, whether in attack or on defence, in line; in which formation they have always proved able to resist and hold in check the assailing column with their centre, until by the advance of their wings they can overlap the enemy's flanks and crush him. It is worthy of remark, that wherever the English have varied from what may be called their national order of attack, in line two deep, and have assailed in column, as at Fontenoy and Chippewa, they have suffered disaster. The

inference is nearly irresistible, that the central attack by column is radically faulty against firm and steady troops, although it is sure of success against an enemy of inferior physique and discipline, especially if he be demoralized in spirit.—In attacking a redoubt or field fortification, if it be defended only by infantry, the assailants may march immediately to the attack; if it be defended also by cannon, it is necessary first to silence cannon by cannon. The cannonade is conducted in such a way as to break the palisades, dismount the pieces, and plough up the parapet, and thus to oblige the defending cannon to be withdrawn into the interior. After the attacking artillery has thus produced its effect, the light infantry, principally riflemen, envelop a part of the work, directing their fire upon the crest of the parapet, so as to oblige the defenders either not to show themselves at all, or at least to fire hurriedly. Gradually the riflemen approach, and converge their aim, and the columns of attack are formed, preceded by men armed with axes and carrying ladders. The men in the front rank may also be furnished with fascines which both serve as bucklers and will assist in filling up the ditch. The guns of the work are now brought back and directed against the assailing columns, and the attacking riflemen redouble their fire, aiming particularly upon the artillery men of the defence who may attempt to reload their pieces. If the assailants succeed in reaching the ditch, it is essential that they should in the assault act together, and leap into the work from all sides at once. They therefore wait a moment upon the brim for a concerted signal; and in mounting upon the parapet they are met by howitzer shells, rolling stones, and trunks of trees, and at the top are received by the defenders at the point of the bayonet or with the butt of the musket. The advantage of position is still with the defenders, but the spirit of attack gives to the assailants great moral superiority; and if the work be not defended by other works upon its flanks, it will be difficult, though not quite unprecedented, to repel even at this point a valiant assault. Temporary works may be attacked by surprise or by open force, and in either case it is the first duty of the commander to obtain by spies or reconnoissance, the fullest possible information concerning the character of the work, its garrison, defences, and resources. The infantry are often thrown in an attack upon their own resources, when they must rely upon their own fertile invention, firing the abatis by lighted fagots, filling up small ditches with bundles of hay, escalading palisades with ladders under the protection of a firing party, bursting barricaded doors or windows by a bag of powder; and by such measures decisively and boldly used, they will generally be able to overcome any of the ordinary obstructions.

ATTAINER (Fr. *teindre*, Lat. *tingere*, to stain). In the English law this term was applied to the extinction of civil rights, and the forfeiture of estate which followed, when a

person was condemned to death for treason or felony, or where judgment of outlawry had been pronounced against him for not appearing to answer to a capital crime. It might also take place by act of parliament, called bill of attainder. In the case of high treason, the effect of such condemnation, outlawry, or bill of attainder, was forfeiture of all the real and personal estate of the criminal, and corruption of blood, so as to interrupt hereditary descent of any civil right. For all capital crimes less than high treason, there was a forfeiture of personal property absolutely, but of real estate only the use during life. By stat. 7 Ann, c. 21 (the operation of which was suspended at first during the life of the pretender, and afterward during the lives of his sons, but which suspension was repealed by 39 Geo. 3, c. 93), it was enacted that no attainder for treason should extend to the disinheriting of any heir, or to the prejudice of any person other than the traitor himself. And by stat. 54 Geo. 3, c. 145, in cases of felony (which term designated all crimes punishable by forfeiture of lands and chattels, and to which capital punishment was a usual incident), except in certain specific cases, the person who would be entitled to the lands of the offender upon his death, may enter thereon immediately. In this country the passage of bills of attainder by any state is prohibited by the constitution. By statute of the state of New York, no forfeiture is caused by any offence except upon outlawry for treason, 2 R. S. 701, § 22, and in that case the forfeiture is of lands only for life, of personal estate absolutely, id. 656, § 3.

ATTAINT, a charge of a false verdict, upon which a jury of 24 was summoned to try the attaint. At common law this process was used only when the proceeding had been upon a writ of assize, and was probably resorted to only for the purpose of getting the decision of a common jury instead of recognitors of assize, but was afterward extended to all actions, by various statutes. The proceeding has, however, been long obsolete, and was abolished in England by 6 Geo. 4, c. 60. A similar act has been passed in New York, 2 R. S. 421, § 69.

ATTAKAPAS, a large and fertile section of southern Louisiana, including several parishes. Though often mentioned in conversation and in commercial reports, it is not the legal appellation of any subdivision of the state. Great quantities of sugar and molasses are produced in the district and shipped at Franklin.

ATTALA, a county in central Mississippi, which has an area of 630 square miles, and 10,991 inhabitants, of whom 8,412 are slaves. Big Black river forms its western boundary. Its surface is undulating, and the soil, in some parts, fertile. Its name is taken from Atala, the heroine of an Indian romance by Chateaubriand. Kosciusko is the county seat. In 1850 the productions were 5,631 bales of cotton, 522,508 bushels of Indian corn, 112,158 of sweet potatoes, and 120 hogheads of sugar. There

were 15 churches, 8 newspaper offices, and 590 pupils attending public and other schools.

ATTALUS. I. A Macedonian nobleman, lieutenant of Philip of Macedon, lived about 870 B. C. He was the uncle of Cleopatra, whom Philip married after his repudiation of Olympias. When the marriage of his niece was celebrated, he insulted the young Alexander by offering as a toast an aspiration to the gods for a legitimate heir to the throne. Alexander threw his drinking-cup at the head of Attalus. Philip took the part of his lieutenant, and seized his sword to chastise his son. After the accession of Alexander, he procured the assassination of his old enemy. II. The first prince of Pergamus who assumed the title of king, born 289 B. C., died 197. He was the founder of the celebrated library of Pergamus, second only to that of Alexandria.

III. **FLAVIUS PRISCUS**, elected Roman emperor A. D. 409. He was a native of Ionia, and a pagan, but became converted to Arian Christianity, and was christened by a Gothic bishop. He became a member of the Roman senate A. D. 408, at a time when Alaric, king of the Visigoths, was besieging Rome. Attalus was then prefect of Rome, and Alaric, being also an Arian, thought of proclaiming him emperor as a rival to Honorius, then at Ravenna. This was done; but Attalus, acting independently of the barbarian chief in some things, was by him deposed after a few months' reign. After the death of Alaric, Attalus accompanied Ataulphus into Gaul. When in 414 Ataulphus married Placidia, the sister of Honorius, Attalus sang an epithalamium at the marriage. Ataulphus, unable to come to terms with Honorius, proclaimed Attalus emperor once more; but after Ataulphus's assassination, the next Visigoth chief made peace with Honorius. Attalus, left without protection, fled to Spain, was captured at sea, and had the fingers of his right hand chopped off, as a punishment, and in order to prevent him from writing, and was condemned to end his days on the Lipari islands. He was afterward recalled to Rome, where he died in obscurity.

ATTAMAN, is the title of the supreme chief of the Cossacks, but is still retained only by those of the Don. The attaman was elected by the people in a general public meeting; the mode of election was by throwing their fur caps at the favorite, and he who had the largest heap of caps was chosen. In this way the attamans of the Cossacks of the Ukraine or of the Dnieper, were elected, from the very beginning of their free democratic organization. When in the 16th century the Cossacks submitted to the Polish nation, the election of the attamans was confirmed by the Polish king, from whom they received as signs of investiture a standard, a baton of command, and a great seal. After the secession of the Cossacks from Poland and their submission to Russia in the 17th century, the attamans preserved the same rights, and were elected and confirmed according to the former

mode, until the insurrection of the celebrated Mazeppa. After this event the office was suppressed until 1750, when it was restored in the person of Count Razumoffsky. When Catharine destroyed the organization of the Cossacks of the Ukraine, the dignity of attaman was confined to those of the Don. The last elective attaman of these Cossacks was Platoff, often mentioned in histories of the campaigns against Napoleon in Russia, Germany, and France, in 1812-'14. After his death, the emperor Nicholas made the dignity of attaman hereditary in the grand duke, the heir to the empire, and thus abolished the old right of the Cossacks to choose their chief. The commanders of various other Cossack organizations in Russia bear the title of attaman, but only by custom and courtesy. From the word attaman is derived the word *Hetman*, in ancient Poland, the commander of all the military forces of the nation, an office similar to that of grand connetable, in France, previous to the revolution.

ATTAR, or **OTTO** or **ROSEA**, a delicious perfume extracted from the petals of the rose. It is a volatile oil, of soft consistency, nearly colorless, and deposits a crystallizable substance which is partially soluble in alcohol. The best article is prepared at Ghazipoor in Hindostan; but it is apt to be much adulterated with sandal wood and other oils. The whole country, for many miles around Ghazipoor, is a garden of roses, and in the spring of the year presents a most beautiful picture of red and green. The roses are used both for rose water and the oil of roses. The latter is obtained from the rose water by setting it out during the night in large open vessels, and early in the morning skimming off the essential oil, which floats at the top. The rose water after the removal of the oil is not so highly valued as before. It is estimated that 200,000 well-grown roses are required to produce half an ounce of the oil; and the value of this when it is manufactured is about \$40, and even then it is likely to be adulterated. If warranted genuine at the English warehouses it sells for about \$50, or \$100 per ounce.

ATTENTION, the act of fixing the mind, in its thinking, upon any one object or class of objects. It is also used to express the mental state when thus fixed. It is usually said to be voluntary, and is defined by Brown to be perception united with science or volition. Attention, however, considered as a mental state, may be involuntary, as when the mind is absorbed in the contemplation of one subject, even in spite of effort to distract it, by change of scene or employment. The power of fixing the mind in attention is greatly increased by practice. The slightest occurrences distract the minds of those who are unaccustomed to habits of close thinking. The same thing is observable in children. Napoleon could so command his attention to several different subjects in quick alternation, as to be able to dictate dispatches to 8 secretaries at once while he himself penned a 4th. Sir Isaac Newton used frequently to be-

come so absorbed in mathematical calculations that he must be violently shaken, to hear a call to dinner; and Neander, in the intensity of his thought, often forgot to commence his lecture, after he had entered the desk, and the class were in waiting. But these remarkable instances of attention may sometimes be idiosyncrasies. Johnson resolves genius into the power of attention. In attention there is a loss of consciousness, and so of lapse of time, since the succession of ideas is the natural measure of time.

ATTERBOM, PETER DANIEL AMADEUS, a Swedish poet born in the parish of Asbo, county of Christianstad, Jan. 19, 1790, died at Upsal, July 21, 1855. His genius, fostered by the influence of his father, a worthy minister of the gospel, and by excellent educational advantages at Linköping and Upsal, was blended with fervent aspirations for the emancipation of the literature of his country. To free it from the shackles of French, and other corrupt influences, was the ambition which haunted him and some of his fellow-students at Upsal, and found vent in the Aurora association, established by them in 1807, and in a periodical called the "Phosphorus," which they founded a few years afterward. Thus he had abundant opportunities to express his admiration of German (especially of Schlegel and Schelling), and his aversion for French, and modern Swedish literature. This brought him into direct antagonism with many of the conservative academicians, and the literary feud between the two parties was conducted in a spirit so belligerent that bitter feelings began to destroy the peace of Atterbom, who, by his remarkable contributions to the "Phosphorus," occupied a foremost position, and had to bear the whole brunt of the battle. In 1817 he sought relief in a tour to Germany and Italy, and in 1819, on his return to his native country, we find him officiating as German teacher of Prince Oscar, the present king of Sweden. Subsequently, he became connected, as professor, with his own *alma mater*, and the last vestige of his former opposition disappeared in 1839, when he was received as member of the same academy, against which he darted, in the days of his youth, such terrible arrows from the pages of the "Phosphorus." His learning took a wide range, and at the university of Upsal we find him successively giving instruction in history, philosophy, metaphysics, and finally, in 1835, in æsthetics. Among his satirical contributions to the anti-academical organ of his early days, a drama, in prose, entitled *Rimmarbandet*, or, the league of the rhymers, carried the palm. As founder, and for many years editor of the *Poetisk Kalender* (poetic almanac), he exerted a marked influence upon æsthetic culture in Sweden. Some of his most exquisite productions, as, for instance, the "Flowers," appeared in this almanac. He was the first to introduce sonnets and octaves into Swedish poetry. His lyrical poems are contained in his *Samlade*

Dikter (collected poems), published at Upsal, 1836. His *Skrifter* (confessions), 1 vol. 1835, treat of history and philosophy. To blend the spirit of religion with that of the latter science was the aim of his theories. The most important of his other works deals with literature from a historical point of view. It is entitled *Seemåls Skare och Skaldar* (the seers and poets of Sweden), and constitutes, in fact, his most elaborate production. The 6th and last volume of this work appeared in 1856.

ATTERBURY, FRANCIS, an accomplished prelate, and zealous high churchman of England, and a conspicuous figure in the political troubles of the reigns of Queen Anne, and George I., born at Middleton, in Buckinghamshire, March 6, 1662, died in Paris, Feb. 15, 1732. He was educated at Westminster school, whence he was elected to a studentship at Christ Church, Oxford, and in each of these places distinguished himself by his classical attainments, poetical abilities, and imperious and aspiring spirit. His first publication was a Latin version of Dryden's poem of "Abealom and Achitophel," which was quickly followed by an edition of several Latin poems by Italian authors. In 1687 he took the degree of master of arts, and in the same year appeared as the champion of the church of England, then persecuted by James II., and denounced by Roman Catholic writers. The title of his work was "Considerations on the spirit of Martin Luther, and the Original of the Reformation," in answer to a tract of the same title by Walker, the active Catholic master of university college. This work, written in a vigorous rhetorical style, and which first revealed the author's command of contemptuous invective, is ranked by Bishop Burnet among the ablest defences of the Protestant religion. After the revolution of the next year, Atterbury, though by education and conviction a Jacobite, and though his associations at Oxford were only with high Tories, and high churchmen, yet like many other persons of the time who entertained similar views, swore fealty to the government of William and Mary. He soon after entered into holy orders, but continued his residence at Oxford, and became one of the combatants in the critical warfare which was waged between Boyle and Bentley, between Oxford and Cambridge, about the epistles of Phalaris. Charles Boyle, a student of Christ Church, and a nephew of the philosopher Robert Boyle, published an edition of what were termed the letters of Phalaris, an inhuman tyrant of Agrigentum in the 6th century before our era. He provoked the notice of the greatest scholar of the age, Richard Bentley, by an unceremonious allusion to him in his preface. Bentley accordingly issued a small dissertation, in which he adduced abundant evidence that the letters were spurious, that their Greek was palpably the degenerate and feeble Greek of the 3d or 4th century, and that the critical apparatus furnished by the new edition was entirely worth-

less. Bentley was a Cambridge man, and his book was deemed an attack upon the scholarship of Christ Church, Oxford. The men of that college, dispersed over the kingdom, powerful in the professions, in politics, in society, all joined to vindicate the honor of their college. The name of Boyle was retained upon the title-page of the answer to Bentley, but the work itself was the combined effort of all the wit and all the learning which could be mustered among the alumni of Christ Church. The principal champion, however, was Atterbury, and though he knew but little Greek, he yet wrote the larger part of the volume in so skilful a manner that he was esteemed a master of classical learning. Bentley, who would hardly have pardoned the blunders of his opponents in schoolboys, found himself worsted by their intrepid assertions, brilliant rhetoric, and keen and ludicrous personalities. The whigs would have rejoiced in the discomfiture of the Tories of Oxford, the Cambridge men would have applauded any thing which looked at all like a victory of their university, but the general voice of the public was in praise of the performance of Atterbury. Bentley spent 2 years in writing an answer, which will always be valuable to the student of Grecian antiquity, and proved, beyond all question, that though Atterbury wrote finely, he was yet wholly ignorant of the subject, and that he was entirely wrong on every point involved in the discussion. Meantime, the restless and ambitious mind of Atterbury had become disgusted with the quiet life at Oxford. He felt himself, he said, "made for another scene, and another sort of conversation." He left the university in 1791, and began to preach in London, where his graceful and powerful delivery, and clear and elegant style, at once rendered him popular, and gained for him an appointment as one of the chaplains of William and Mary. His vehement defence of high church doctrines involved him, during the next 10 years, in a series of controversies. As a member of the lower house of convocation, he sought to raise the power, and extend the privileges of this house, and to make it more independent of the civil power and the episcopal order. He wrote numerous treatises upon the subject, the most important of which was entitled the "Rights, Powers, and Privileges of an English Convocation, Stated and Vindicated," and was in reply to Dr. Wake, afterward archbishop of Canterbury. These pieces were written with acrimony, and exhibit all the artifices of the controversialist, but their ingenuity and ability were acknowledged by his opponents, Hoadley and Burnet. He received the thanks of the lower house of convocation for his services, and the degree of doctor of divinity from the university of Oxford, though he was not then of sufficient standing to have obtained it in regular course. On the accession of Queen Anne, he became chaplain in ordinary to her majesty, and 2 years afterward dean of Carlisle. During the

ascendency of the whig party, he was indefatigably active in the lower house of convocation, of which, in 1710, he was elected prolocutor. In 1710 the famous trial of Dr. Sacheverell took place, and Atterbury signally displayed his talents in turning it to the advantage of the Tories. He was thought to have composed, in great part, the eloquent speech delivered by Sacheverell at the bar of the house of lords. The Tory party now had in its service the ablest writers of the time, and of these writers no one was more active or effective than Atterbury. Upon the change of ministry which followed, and the elevation of the Tories to power, he was rewarded by being made canon of Exeter cathedral, preacher at the Rolls chapel, and in 1712 dean of Christ Church. He was welcomed as the head of his old college with every mark of honor, but his domineering and contentious spirit soon gave great dissatisfaction. His early friend, Smalridge, succeeded him in both his deaneries, and is said to have complained of his lot in being obliged to carry water to extinguish the flames which Atterbury kindled. The latter was soon removed from Christ Church, and made a bishop, as his enemies said, because he was so bad a dean. On Lord Oxford's recommendation, he was promoted to the bishopric of Rochester, to which the deanery of Westminster was then attached. He now aspired to the primacy, and had a vacancy occurred at this time, he would probably have been raised to the archbishopric of Canterbury. But the sudden death of the queen, and the accession of a house known to be partial to the whigs, disappointed all his hopes of further advancement. In the moment of trepidation after the queen's death, he besought Bolingbroke and Ormond to take measures for establishing the pretender upon the throne, and offered himself to proclaim him, in full canonicals, at Charing-cross. No plan, however, had been matured, and Atterbury, who alone was fearless and resolute, declared, with indignation and grief, that "never was better cause lost for want of spirit." He was received with distrust and coolness by George I., and soon evinced his disaffection by refusing to sign the loyal declaration of the bishops during the rebellion in 1715. At the same time he employed all his eloquence in the house of lords in opposing the measures of the court and ministry, and drew up some of the most violent protests against them. He also wrote sparkling and bitter pamphlets for popular distribution. Long suspected of having plotted for the restoration of the ejected family, and of having been, at least, in indirect communication with them, he now engaged directly in a correspondence with the pretender. He was charged by a secret committee of the house of commons with being concerned in a plan for domestic insurrection and foreign invasion. The scheme was well matured, but it came to the knowledge of the English government through the regent of France. The evidence against him was deem-

ed sufficient to justify his arrest and committal to the Tower, Aug. 24, 1722, amid much popular excitement. In the following March a bill of pains and penalties was brought against him, having for its object his deposition and banishment. This bill passed the commons without much discussion, the bishop making no defence in that house, but the contest in the house of lords was long and sharp. Atterbury there spoke for the last time in his own defence, and his powerful and touching eloquence, and firm demeanor, produced a great effect. When the house divided, there were 43 against, and 83 for the bill, and on May 27, the king, it is said, reluctantly signed it. That Atterbury was guilty of the crimes charged against him cannot be doubted, but it has become the general opinion that the matter was judged at the time with partisan vehemence, and that though the proofs which were adduced against him might have been sufficient legally to convict him, yet some of the ancient forms, designed to guard political trials, were dispensed with. Atterbury received the news of his fate with fortitude and composure, and took an affecting leave of the friends whom he loved. On the next day, June 18, he was embarked on board a man-of-war, and conveyed to Calais. Nearly every court of Europe was occupied with the schemes of the pretender, and Atterbury became his ablest and not least active partisan. After residing a short time at Brussels, he fixed his abode at Paris, where he consoled himself in corresponding with eminent men of letters, and became the most discreet and efficient of the promoters of the Jacobite cause. Yet James was not wise enough to put all confidence in his surpassing genius, and Atterbury had too much spirit to be willing to continue counsels which passed unheeded. He quitted Paris, and resided for nearly 2 years in the south of France, cheered by the hope of a visit from his beloved daughter, Mrs. Morice, who was languishing under consumption, but for whom a milder climate was prescribed. The anxious wish of the daughter to see her father once more before she died was vouchsafed her. She met him at Toulouse, was able to share his conversation a few hours, but died in his arms the same night. Atterbury hardly recovered from the heavy affliction. He was recalled in 1780 to Paris by the pretender, and again exerted himself in behalf of a desperate cause, but his stormy life was near its close. At this time he published one of his most admirable letters in reference to a charge made against his edition of Lord Clarendon's history, that noble product of the old monarchy, from which he had derived his own principles of loyalty. He alluded to the coincidence that he and Clarendon were the only 2 subjects of England who had been banished and deprived, by act of parliament, of all intercourse with their countrymen. He lived but a few weeks after this, and his body was permitted to be brought to England and buried in Westminster abbey. Bishop Atterbury was

probably inferior in talents to no one of his contemporaries. Few men have ever written the English language with greater purity or strength. He cherished, while it was in his power, the society of the best poets of his time, and his counsels and conversation were esteemed and sought by them. He was an admirer of Milton, before the merits of that poet had been generally recognized. Pope thus alludes to him:

How pleasing Atterbury's softer hour,
How shined his soul unconquered in the tower!

In his political views he steadily opposed the accession of the house of Hanover; and after taking the oath to that house, he yet intrigued and conspired for its overthrow. Though in his political career and his conduct in controversy he was often impetuous and intemperate, yet his gentleness in congenial society, and his devoted love to his daughter, shed a milder light around his character.

ATTERSEE, or **KAMMERSEE**, a lake in upper Austria, 12 miles in length from north to south, and 8 in width. It lies 40 miles S. W. from Linz. From its northern extremity flows the river Ager.

ATTIA LEX, a law proposed by the Roman tribune, Titus Attius Labienus, 64 B. C., that the Roman people, and not the priesthood, should have the power of appointing to the vacant pontificate.

ATTIC, pertaining to Attica in Greece, or its principal city, Athens, a term denoting the possession of the qualities for which the Athenians were remarkable, as Attic wit, or Attic salt, Attic style, Attic faith.—**ATTIC BASE**, the base of a column, used in the Ionic and Corinthian orders, and by some architects in the Doric.—**ATTIC ORDER**, a kind of order, used over a larger order, to complete the building, never with columns, but with antæ or small pilasters.—**ATTIC STORY**, the upper story of a house with small windows, either in or above the cornice.

ATTICA, the name of a triangular peninsula in southern Greece, containing about 1,000 square miles. Its east side is bounded by the Ægean Sea, the west by the Saronic Gulf, and the north by the mountains which separate it from Bœotia and Megaris, viz.: the Oithæron and the Cnæan range, or the Cerata and Parnes, which terminates at the sea on the east. From these mountains branches extend into the interior, dividing the territory into 5 plains. Ægaleos extends from Parnes to the eastern side of the Bay of Eleusis, and with the Cerata forms the Eleusinian and Thriasian plain. Pentelicon, branching from Parnes and Hymettus, separated from Pentelicon by a narrow valley, bounds the plain of Athens on the east and south-east, Parnes on the north, and Ægaleos and the Saronic Gulf on the west. South of Pentelicon, and east of Hymettus, lies the Mesogæa, a midland region, partly a plain and partly a tract of undulating surface. The plain of Marathon, forming part of the Diacria,

lies in the north-east angle of Attica, bounded by Parnes and Pentelions on the north-west, and south-west, and by the sea on the east. The Paralia, or coast district, embraces the southern portion of Attica, from the promontory of Zoster on the west, round the foreland of Sunium to Brauron on the east. The line of coast from Cerata to a point north of Marathon, is about 120 miles. It is included between $37\frac{1}{2}^{\circ}$ and $38\frac{1}{2}^{\circ}$ north lat., and $41\frac{1}{2}^{\circ}$ and $42\frac{1}{2}^{\circ}$ east long. from Greenwich. Attica terminates south in a mountainous region, anciently called Laurium, famous for its silver mines. It is distributed into 5 natural divisions, the Eleusinian and Thriasian plain, the Athenian plain, the Diacria or highlands, with the plain of Marathon, the Mesogæa or midland, and the Paralia, or sea-coast. The principal rivers in Attica, never more than small streams, are the Cephissus, north of Athens, running across the plain in a south-west direction, the sources of which are in Parnes and Pentelions; the Ilissus, whose sources are in Hymettus, running south of Athens, in a south-west direction. Two or three small streams flow into the sea on the eastern coast, the principal of which was the Erasinos. The soil of the tillable parts of Attica, though thin and light, was in ancient times made very productive. It is less so now, partly on account of defective agriculture, and partly because the trees have been so generally destroyed, that the supply of moisture is greatly diminished, and the streams have shrunk considerably within their original dimensions. Mt. Pentelions produced an inexhaustible supply of excellent marble, and its quarries furnished the materials for the principal structures in Athens. They have been reopened in recent times, and a part of the king's palace is of Pentelic marble. Marble was also procured from Hymettus, and from Eleusis. Beside grain and vegetables, Attica produced grapes, figs, and olives, of excellent quality, and the delicious honey of Mt. Hymettus; but she was obliged to depend on foreign supplies for a considerable part of the food consumed by the inhabitants. The commercial genius of the Athenians, early developed by their situation, by the maritime tastes of the people, and by the excellent silver currency furnished from the mines of Laurium, and wisely maintained in its purity, made the importation of articles of necessity and luxury easy. The port of Piræus was one of the busiest commercial cities in the ancient world. The ancient Athenians were very fond of country life, and Attica was covered with pleasant dwellings, well-cultivated farms, and beautiful gardens. The economy of a well-regulated Attic household is charmingly described by Xenophon, in the sketch of Ischomachus. It has been mentioned in the article on *ATHENS*, that the communities or towns of Attica were early united under one constitution. Athens was the capital; and the inhabitants of Attica were politically citizens of Athens, having a right to

assemble in the city and take part in the political, judicial, and legislative proceedings there. The oldest communities of Attica were Cecropia, Tetrapolia, Epacria, Decelia, Eleusia, Aphidna, Thoricon, Brauron, Cytherus, Sphetus, Cephissia and Phalerus. Another division was that into the 4 Ionic tribes, which, under various names, existed to the time of Cleisthenes, who reorganized the popular body into 10 tribes, bearing the names of Erechtheis, *Ægeis*, Pandionis, Leontis, Acamantis, *Cleneis*, Cecropia, Hippothoontis, *Æantis* and Antiochia, from ten of the ancient heroes. In 307 B. C. the number was increased to 12, by the addition of the Antigonias, and Demetrias, in honor of Antigonus and Demetrius. Antigonias was afterward changed into Ptolemais and Demetrias into Attalis. In the reign of Hadrian, the Hadrianis was added to the 12, in grateful acknowledgment of his benefactions to Athens. The tribes were divided into demes (see article on *ATHENS*), small local divisions, of which the number differed at different times, 174, according to Strabo, having been mentioned by Polemo, a writer of the 3d century B. C. About 160 names are known, and the position of a considerable number of them is ascertained. Both tribes and demes had their local and their special affairs, with which the whole body of the people had no particular concern. In all official documents it was the custom to add to the name of a citizen that of his father in the genitive case, and an adverb, designating the deme to which he belonged. Sometimes the name of the tribe was subjoined.—The population of ancient Attica has been variously estimated. According to the careful computation of Boeckh, the whole number, in the time of Demetrius Phalereus, 309 B. C., was 500,000, of whom about 185,000 were free, and the remainder were slaves, making the proportion of slaves to the free nearly 4 to 1. During the Roman period, Attica shared in the fortunes of the capital. Eminent personages, belonging to the nobility of Rome, were fond of having country residences in the neighborhood of Athens. In the middle ages, the condition of Attica was but imperfectly known. It formed part of the *Thema* of Hellas, in the Byzantine empire. During the Frankish domination it was part of the territory of the dukes of Athens. When Greece was conquered by Mohammed II., in 1456, Attica, with the rest of the country, was subjected to the burthens of the administrative system of the Turks. The Timariot system does not appear to have been introduced into Attica. The plain of Athens, as we have seen in the article on that city, was often the battle-ground of the war of the revolution, and the population of Attica was greatly diminished. Since the reestablishment of order in the country, and the organization of the kingdom of Hellas, and especially since the city of Athens became the capital of the country, the population has made decided progress, and a considerable part of the territory has

been brought under agricultural operations. Attica and Boeotia form one of the ten *nomoi* or departments, into which the kingdom is divided, and Attica is a diocese. The population of the nome, in 1855, was 95,229, of whom considerably more than half must have belonged to Attica. Modern Attica includes Megaris, and the islands of Ægina and Salamis. The principal places, beside Athens, are Piræus, Liopesi, Marcopoulo, Keratia, Marathona, Kalamo, Marusi, Menidhi, Ohasia, Leosina (Eleusis), Vilia, Megara, Kolouri (Salamis), Ægina (in the island), Angistri. The climate of Attica is moderate and healthful. The aspect of the country is generally somewhat barren, but there are extensive olive groves, north of Athens, and parts of the mountain slopes are tolerably well wooded. Early in the spring, however, there is a wonderful and beautiful outburst of plants and flowers, up to the very surface of the Acropolis. Attica still produces excellent wheat, olives, grapes, and Hymettian honey; and might be made by a judicious system of agriculture, and the wise employment of capital, as productive as in ancient times; so that instead of 50,000, it might support 500,000 inhabitants. The peasantry are, however, an honest and simple-hearted race; not yet well educated, or at all skilful as tillers of the earth. They have none of the modern improvements on their little farms, and few of the conveniences of civilization in their houses or huts. But efforts are making, which must, in a few years, be successful, to diffuse among them practical information, and to raise their condition in respect to the comforts, if not the luxuries of life.

ATTICUS HERODES, TIBERIUS CLAUDIUS, a man of great wealth and accomplishments, born during the reign of Trajan, at Marathon, and hence called Marathonius. He claimed descent from Cæcrops and Miltiades, though, in his father's time, his family, through misfortune, had fallen into poverty and obscurity, from which they were suddenly raised by the accidental finding of a great treasure. Through this means the father of Atticus was enabled to secure for his son the services of the best teachers, and so well did Atticus profit by their instructions that he became renowned for his learning and ability, and obtained, finally, the office of tutor of the sons of Titus Antoninus. He studied rhetoric under Scopelian with such success as to win for himself the surnames of the "Tongue of the Greeks," and the "King of Eloquence;" but his literary remains fail to attest the fame conferred by these titles. During a portion of his life he held public office, being at one time eponymos of Athens, at another holding the prefecture of the free cities of Asia. While in these positions he used his immense wealth to construct costly public baths, canals, and public buildings. He married Anna Regilla, a Roman lady, upon the occasion of whose death he carried the demonstration of his grief so far as to overlay all the bright colors of his house with black Lesbian marble.

An inscription upon a statue erected by Atticus to her memory excited much discussion among the antiquarians of the 17th century. —TITUS POMPONIUS, a Roman of the equestrian order, has come down to posterity as one of the most honorable, high-bred, unselfish, and truly cultivated men of that nation. Born 109 B. C., he was a contemporary of Cicero. During the civil wars between Sylla and Marius he spent about 20 years in Athens, and thus perfectly mastered the Greek language, rendering many services to the Athenians, who raised statues in his honor; hence his surname Atticus. Recalled by Sylla in the year 68 B. C., he resided in Rome, and was celebrated for his hospitality, numbering among his friends such men as Hortensius, Pompey, Cæsar, Brutus, and above all Cicero. Agrippa, friend of Augustus, married Atticus's daughter. He had no ambition, never accepted the high offices proffered him; made a generous use of his great wealth, during the civil wars was able to be on friendly terms with all parties, and died at the age of 77, starving himself to death to avoid other physical sufferings. He possessed a very extensive library, and employed his slaves to copy MSS., selling the copies. His annals, a general history, extending over 700 years, are highly prized by classical writers, but have not come down to us. He also wrote several other works, as the "History of Illustrious Roman Families," one on the consulate of Cicero, all of which are lost. His name has been preserved from oblivion by the letters addressed to him by Cicero, and by a biography written by Cornelius Nepos.

ATTIGNY, a very old town in the department of Ardennes, N. E. France, on the left bank of the river Aisne. Though comparatively unknown, it had a great importance under the Merovingian and Carolingian kings, being the summer residence of some of them. Here it was that the successor of Charlemagne, the emperor Louis le Debonnaire, had to submit to a public penance, in expiation of the death of his nephew Bernard, king of Italy.

ATTILA, called by the ancient Germans ETZEL, in the Magyar language ATZEL, son of Mountzouk, was a Hun, of royal lineage. In A. D. 434, with Bleda, his brother, he succeeded Roas, their uncle, in the leadership of their people. The Huns at that time were established in Pannonia, and extended over ancient Scythia or Sarmatia to the Dnieper and the Don. The 2 brothers threatened to invade the eastern empire, whose emperor, Theodosius II., obtained peace only by a heavy ransom. Very soon the power of these barbarians came to be terribly felt in both Asia and Europe. Attila assured the Huns that he had discovered the sword of their god, with which he was to procure for them the dominion of the world. He called himself the Scourge of God, and his subjects looked on him with superstitious awe. In 444 he ordered the murder of his brother, as a dictate of the divine will, and the fratricide was

celebrated as a victory. In a short time he extended his sway over countless tribes of Germany and Scythia, from the Baltic to the Black sea. The Ostrogoths, Vandals, Gepidæ, Heruli, Rugians or Northern Slavi, and the Slavi of the Danube, with many Caucasian, and trans-Volgiens and northern Asiatic nomads, obeyed him. It is even said that he concluded an alliance with a Chinese emperor. He invaded Persia, but being defeated in the plains of Armenia, he turned toward the eastern empire. With an army, which is said to have counted 700,000 men, mostly cavalry, he overran Illyria and all the region between the Black sea and the Adriatic. Theodosius II. was overpowered in 8 successive battles, and Constantinople owed its escape to the ignorance of the barbarians in the art of sieges. Thrace, Macedonia, and Greece were devastated, and more than 70 of the most flourishing cities destroyed. Theodosius obtained peace again only by an enormous ransom. Olysiaphius, one of the eunuchs, and minister of the imperial court, bribed Edekon, a companion of Attila, to murder him. But the murderer confessed his purpose, and Constantinople trembled in fear of Attila's revenge, who, however, only overwhelmed the emperor with bitter reproaches for his treachery, and demanded the head of the minister. About 451 Attila turned west toward Gaul. With a countless army of barbarian tribes, each led by its own chief, he marched through Germany, where, among others, a tribe of the Franks joined him, crossed the Rhine, the Mosel, and the Seine, ravaging countries and destroying cities. Leaving Paris unharmed, he reached the Loire, and encamped under the walls of Orleans. The inhabitants, encouraged by their bishop, Anianus, resisted the first attacks of the assailants, and were soon relieved, on June 14, by the approach of the army of Aëtius, the commander of the Romans, with their allies, the Visigoths, under their king, Theodoric; the Franks, under Meroveus, the Burgundians, the Alani, and other barbarians. Attila retired into Champagne, and took his stand in the Catalaunian plains, where Chalons-on-the-Marne is now situated. Here he fortified his camp, surrounding it with a breastwork of wagons. Attila consulted the soothsayers, and their answer was that he would lose the battle, but the enemy would lose their chief. Not daunted by the prophecy, Attila addressed to his companions a glowing speech, pointing to their enemies, and especially to the Goths, who, as he said, had fled before the Huns from one end of Europe to the other. He spoke of their share in the glorious deeds before them, and of the rewards awaiting the victors. The Huns vociferously demanded to be led on, and precipitated themselves upon their enemies, following Attila, who was the first to throw his javelin. Both the armies fought with incredible rage and obstinacy. Finally, the lines of the Romans began to yield, the king of the Visigoths was slain, and the Huns were almost sure of victory. At

this moment Thorismund, son of Theodoric, who commanded a reserve on some neighboring heights, hurled down his troops with such fury that the Huns, pressed on all sides, could scarcely reach their camp. There Attila ordered all his treasures to be put in a heap, and determined to burn himself on the pile at the last extremity. This was the most murderous battle ever known in European history; it was fought in the last days of June, and is recorded as the battle of peoples (*Völkerschlacht*). A small rivulet, running through the plain, was swollen to a mighty torrent of blood, in which the combatants quenched their thirst; 160,000 men were left dead on the field. It was said that the spirits of the slain continued in the air their furious struggle, a legend which has been immortalized by the pencil of the German Kaulbach. The victors did not, however, push their good fortune to the extreme. Attila retreated toward Germany, harassed only in his rear and flanks by the Merovean Franks. Gathering fresh hosts the following year, Attila invaded Italy. He said he had come to take as his bride Honoria, sister of the emperor Valentinian III., who had sent to him a wedding-ring, urging him to claim her, and half of the empire as her dowry. The emperor was frightened, and vain proved the prayers and offers of his ambassadors. Attila destroyed the cities of Aquileia, Padua Vicenza, Verona, Bergamo, Concordia, whose houseless fugitives found refuge in the lagoons of the Adriatic, and founded Venice. The Huns passed into Liguria or Lombardy, and pillaged Pavia and Milan, and Attila established his camp in the plains of Ambles, at the confluence of the Mincio and the Po, in the vicinity of Mantua. Nothing could have prevented him from overrunning the rest of Italy. In this camp he received an embassy from the emperor and from the Romans, headed by the pope Leo I. The sanctity of the pope is said to have impressed him, and the chroniclers say the spirits of the apostles, Peter and Paul, appeared to him with menaces, a legend immortalized by Raphael. It is said, likewise, that the companions of Attila were awed by the example of Alaric, king of the Visigoths, who had died shortly after having pillaged Rome, and fearing the same fate for their chief, advised him not to advance toward the holy city. In July, A. D. 452, Attila having concluded a truce, returned to the Danube, meditating for the next year a new invasion of the eastern empire, or, as some maintain, a return to Italy. But he died in 453 in his capital or camp in Pannonia, the night after his nuptials with the beautiful Ildico, whom he had married in addition to the many wives he already possessed. The courtiers found him in the morning struck by apoplexy, and at his feet the weeping and desolated spouse. His body was put in a coffin of iron, over which was one of silver, and a third of gold. He was buried secretly at night together with a mass of treasure and arms, and the prisoners who dug the grave were killed. The

Huns, also, made fearful incisions in their faces, saying that such a hero should be wept with blood. In person Attila was short, with a broad chest, large misshapen head, small, deep-set and piercing eyes, flat nose, and tawny complexion. His movements were imposing and menacing; his voice powerful but agreeable. He was by turns sincere and hypocritical, temperate and dissolute, humane and cruel, just and unjust according to his interests, brave but not reckless, deep in his schemes, quick in execution, undaunted, unscrupulous, irreligious, and terrible in his wrath. His camp, capital, or castle, called Etzelburg, was situated, according to all probability, on the site of the city of Buda, in Hungary. It was an immense edifice of wood, with numerous towers, and surrounded by a wall of planks. The celebrated collection of German poems, known as the *Nibelungen*, is mainly devoted to Etzel or Attila, and to the feasts and pastimes of his court, where the barbarian kings of various tribes resided. The passage of Attila through European history marks the great movement of the northern nations previous to the destruction of the Roman world. Whole tribes changed their residence, and active regions became solitudes, and new occupants poured into them. The empire of Attila broke into pieces after his death, his successors and companions throwing dice for the possession of the various countries and nations.

ATTIRET, JEAN DENIS, a French Jesuit and painter, born at Dole, in the province of Franche Comté, France, in 1702, died at Pekin, China, in 1768. He learned the principles of his art from his father, and had already produced some good pictures, when he entered the society of the Jesuits at Avignon. In 1737 he went to Pekin to pursue his art, at the solicitation of the French Jesuit missionary stationed there, and was employed by the emperor, Kee Lung, to execute numerous commissions. Here he remained during the rest of his life. He produced an immense number of paintings and drawings, mostly in water colors, many of which are valuable from the accuracy with which they depict Chinese physiognomy, dress, and habits, as well as triumphs, festivals, and processions, of an exclusively national character. A series of drawings, representing battles, in which the imperial forces had been successful, were sent to France to be engraved, and so gratified the emperor that he appointed the artist a mandarin, a dignity which he declined.

ATTLEBOROUGH, a township of Bristol county, Mass., 31 miles S. S. E. of Boston, and 11 miles N. N. E. of Providence, R. I. It has very extensive manufactures of jewelry, printed calicoes, metal buttons, and clocks, for which there is abundant water-power by Mill river, which intersects the town. It has a bank and insurance office. Pop. in 1855, 5,451.

ATTOCK, a fortified town of Sind on the river Indus. It formerly belonged to the Afghans, but was seized by Runjeet Singh, and after

his death and the conquest of Sind by the British, it passed into the hands of the British. It is a place of military importance, from having been in all ages the crossing place of the Indus, which is here 800 feet wide, of great depth, and with a strong current. By this route invaders of India from the N. W. have made their way into the great peninsula. Nadir Shah, Timour, and Alexander crossed at Attock.

ATTORNEY, one who acts in the place of another. An attorney-at-law is one who acts for another in a suit at law, his office being similar to that of procurator or proctor in the civil and canon law. Formerly every suitor was obliged to appear in person to prosecute or defend a suit, and this is still the law in criminal cases in England; but in civil causes it became the usage to appoint an attorney to appear in the place of the party, which was done by what was called a warrant of attorney. No one but a person having legal capacity could appear by attorney. An infant, married woman, idiot, or lunatic, was not deemed competent to exercise the discretion of making the appointment. There were several important legal incidents to the office of the attorney: 1. Attorneys were recognized as officers of the courts in which they were admitted to practice, and were held amenable directly to the courts for any misconduct. 2. They were also entitled to certain privileges, as exemption from serving on juries, from arrest on civil process during the sitting of any court upon which they were actually attending. 3. The relation of attorney and client was held to be confidential, so that the attorney was precluded from testifying to any private communication made by the client in relation to his business, and this was regarded as the privilege of the client, which the attorney had no right to waive for him. 4. So the attorney was by statute prohibited from exacting any other fees than those prescribed by law. 5. Attorneys were prohibited from engaging in suits upon speculation, that is, for a part of what should be recovered, and also from buying up claims to prosecute. These English statutes have been substantially reenacted in this country in all the states, but in New York some important modifications have been recently made: 1. An attorney may make an agreement with his client for a compensation, at a different rate from what is prescribed in the fee bill, Code, § 808. 2. By consequence thereof, it would seem that the attorney may also make an agreement with the client to take part of the subject in litigation as a satisfaction or security for such compensation, but subject to the supervisory power of the court to prevent any undue advantage being taken by him.

ATTORNEY-GENERAL, a law officer of state in England and the United States. His office in England is to prosecute for the crown in criminal cases, and to file bills in the court of exchequer, in relation to lands or any interest claimed by the crown. Perhaps it would be a

proper definition of the officer to say that the attorney-general represents the crown in all legal matters in which the government is concerned, either as a party as upon indictments, or of pecuniary interest, and that he may be also called upon for advice in any matter involving the rights of the king. He is specially required to examine all letters patent before the issuing thereof. In theory this is for the protection of the crown against any injury to its prerogative. In later times the most common exercise of this supervision is in relation to letters patent for inventions which, under the regulations now existing, affect only the rights of inventors, and the service is a merely nominal one, and the expense to the parties perfectly unnecessary. This officer is first mentioned in English history in the reign of Edward IV.—The attorney-general of the United States is required to conduct all suits in the supreme court in which the United States are concerned, and to give his advice and opinion upon questions of law, when required by the president or by the heads of departments, touching any matters which may concern their departments. He is also a member of the cabinet.—Each of the states has also its attorney-general, whose duties are similar in relation to the state government.

ATTORNEY, POWER OF. This is an authority in writing, constituting a person as attorney or substitute for one who executes the writing, the person thus constituted being generally designated as attorney in part. It is not indispensable that the authority should be given by a formal instrument. A letter of instructions is sufficient to confer the authority, and sometimes it is inferred from the acts of parties without any evidence in writing.

ATTOYAC, a small river of Texas, rises in Rusk county, and flowing south enters Angelina river at the S. E. extremity of Nacogdoches county.

ATTRACTION, the force which brings bodies together, or resists their separation. The most striking example is in the attraction of gravity, which produces the weight of bodies, and which, of course, has been observed from the earliest ages. Magnetic attraction was also early observed in the loadstone. The attraction of electrically excited bodies was a later discovery. The attraction of cohesion is the force which holds together the parts of a body, whether fluid or solid. The attraction of adhesion is that which holds dissimilar bodies together, when brought into close contact. Capillary attraction is the addition of liquid to the inner surface of small tubes. Chemical attraction is the force which holds dissimilar bodies together, and thus generates a third, different from either; as iron rust and oil of vitriol are held together by chemical attraction, and form copperas. For the laws of attraction, see works upon theoretical mechanics; Newton's *Principia*, Laplace's *Mécanique Céleste*, or Peirce's "Analytical Mechanics."

ATTRI, a river of Hindostan, which flows from the southern limits of Thibet, under the name Teesta, through a passage in the Himalayas, and discharges into the main branch of the Ganges at Jafferege. Length, 100 miles.

ATTRUCH, a river of Persia in Khorassan, near the confines of Khiva, which flows westwardly and enters the Caspian, 43 miles north of Astrabad.

ATTUCKS, ORISFUS, a mulatto, or half-Indian, resident of Framingham, Mass., one of the persons killed on the evening of March 5, 1770, in the affray known as the "Boston Massacre." John Adams, in his defence of the soldiers, says: "This Attucks appears to have undertaken to be the hero of the night, and to lead this army with banners. To form them, in the first place, in Dock square, and march them up to King street. They passed through the main street up to the main guard in order to make the attack. Attucks, with his myrmidons, came around Jackson's corner and down to the party by the sentry-box. When the soldiers pushed the people off, this man with his party, cried, 'Do not be afraid of them; they dare not fire; kill them! kill them! knock them over!' And he tried to knock their brains out. . . . He had hardiness enough to fall in upon them, and with one hand took hold of a bayonet, and with the other knocked the man down. This was the behavior of Attucks, to whose mad behavior, in all probability, the dreadful carnage is chiefly to be ascribed." The funeral of the victims of the massacre was attended with great pomp and ceremony. On the occasion the shops of the town were closed, and all the bells were ordered to be tolled, as were those of the neighboring towns. The procession began to move between the hours of 4 and 5 o'clock P. M., the bodies of Attucks and Caldwell (both strangers in Boston) being borne from Faneuil hall, and those of the other victims from the residences of their families,—the hearses meeting in King street, near the scene of the tragedy, and passing through the main street to the burial ground, where the bodies were all deposited in one vault.

ATTWATER, RUSSELL, a soldier of the revolution, and for 4 years, from 1812, a member of the New York senate, born in Cheshire, Conn., in 1762, died in Norfolk, N. Y., in 1851. On his mother's side he was descended from the noble house of Bedford. During the attack upon New Haven by the British, he was wounded, and left for dead upon the field, but recovered, and was employed in the commissary's department through the war. He was the first settler of the town of Russell in New York, in 1805. After the battle of Waterloo he was employed to negotiate the purchase of a large tract of land in northern N. York, where Napoleon's friends intended that he should reside, should he succeed in making his escape, but after the sale was agreed upon, the news arrived that the emperor had given himself up, and the scheme consequently fell through.

ATTWOOD, THOMAS, a composer of music, born in England in 1767, died in 1838. At the age of 16 he attracted the favorable notice of the Prince of Wales, who sent him to Italy to be educated. At Vienna he was the pupil of Mozart until 1786, when he returned to England. His royal patron made him instructor in music to his concert, and in 1795-'96 aided him in procuring the situations of organist at St. Paul's cathedral, and composer to the royal chapel. In 1831 he also appointed him organist of the private chapel at the Pavilion, Brighton. He wrote operas, songs, glees, trios, and, in the latter part of his life, sacred music. His works are marked by knowledge of orchestral effects, and are vigorously and learnedly written. Some of his operas and songs were very popular in their day, although now nearly forgotten.

ATTWOOD, THOMAS, an English political reformer, born at Halesowen, in the county of Salop, Oct. 6, 1783, died March 6, 1856. He was scarcely arrived at man's estate, when he became a member of the firm of Spooner, Attwoods and Co., bankers, of Birmingham. In 1811 he was elected high bailiff, or mayor, of Birmingham, and from that time threw himself into public life. His two first steps were to oppose the renewal of the monopoly of the East India company on its former footing, and to endeavor to obtain an abandonment of the "Orders in Council," and he was mainly instrumental in procuring their revocation, but not until it was too late to prevent the collision with the United States. On this occasion the artisans of Birmingham raised a subscription of £300 among themselves, to present to him a silver cup. In 1815 and 1816 he took up the currency question, opposed the return to cash payments, advocated the American system of small bills, controverted with all his natural ardor the currency ideas of Mr., afterward Sir Robert Peel, and was the founder of what is since known in English financial politics as the Birmingham school of currency economists. In 1825, when the bank of England was on the eve of stopping payment, Mr. Attwood was summoned to London to give to ministers the benefit of his advice. He advised the immediate reissue of £1 notes, which had been withdrawn from circulation in favor of £5 notes, in spite of Mr. Attwood's protests; his advice was now taken, and the £1 notes were issued. In 1839 he planned the political union of Birmingham, for the purpose of throwing open the house of commons to the middle classes. For his services to the cause of parliamentary reform, he was presented with the freedom of the city of London, May 21, 1832, with the following resolution, which sums up in a few words the contemporary opinion upon his services: "That the freedom of the city, in a box made of heart of British oak, be presented to Thomas Attwood, esq., in testimony of the high estimation in which the citizens of London hold his distinguished services in the cause of parlia-

mentary reform, and also the ability displayed by him in uniting the intelligent and industrious artisans, and the inhabitants generally of the midland districts, in the firm but peaceable pursuit of that great national object." Birmingham sent Mr. Attwood as her first representative to the reformed house of commons. He did not make a brilliant figure there, though he represented Birmingham in 3 successive parliaments for 7 years. On Dec. 9, 1839, he resigned his seat, on the ground of ill-health, and his constituents held a public meeting to thank him for his services. From this time until his death he lived in retirement.

ATWOOD, GEORGE, an English mathematician, born in 1745 in the parish of St. Clement Danes, London, died at Westminster in 1807. He was educated at Westminster school, from which, in 1765, he was elected to Trinity college, Cambridge, where he graduated in 1769, third on the list of wranglers. In 1772 he took his degree of master of arts, and for a number of years resided at his college as one of its fellows. He also lectured on experimental philosophy, and other subjects of general scientific interest, before the whole university, with such ability that distinguished men came from all parts of the kingdom to hear him. Among others, William Pitt, then rising into eminence as a statesman, attended Atwood's lectures, and was so impressed with his mathematical powers that he sought his acquaintance, and, upon becoming prime minister, appointed him to the sinecure office of deputy searcher of the customs in London, in order that his services as financial calculator might be secured to the government. The value of these services, at a time when the revenue of the kingdom was a matter of exceedingly nice calculation, was duly appreciated by Pitt, between whom and Atwood a strong friendship existed, which was only interrupted by the death of the great commoner in 1806. Atwood's labors in behalf of government did not interfere with his literary undertakings, and during the last 20 years of his life he published several important contributions to science, among which are a "Treatise on the Rectilinear Motion and Rotation of Bodies," another on the "Construction of Arches," "The Stability of Ships," and a "Review of the Statutes and Ordinances relative to the Assize of Bread." He also gained the prize medal at Cambridge, and received the Copleian medal from the royal society. He was fully versed in the theory and practice of music, for which he evinced so great a liking that, on one occasion, he superintended a concert at Cambridge, in aid of a charitable institution; the most eminent professional performers of the day took part. His books did little to enlarge the sphere of human knowledge, as he lacked the essential ability to handle the differential and integral calculus; but they have done much to diffuse knowledge, especially by their detail of ingenious experimental illustrations of mechanical laws. Atwood's

machine is, in particular, a contrivance to illustrate and measure the laws of acceleration. He died unmarried, surviving his illustrious friend and patron but a few months.

ATUA, in mythology, the general name of the deities of the pagan Maori or aborigines of New Zealand. Each tribe has its own atuas. The atuas are presided over and subordinate to the father of the gods, Mawe, who is the only universal deity or *dous publicus* of the New Zealand race. The atuas are merely *dei patrii*, or local authorities, having no jurisdiction, power, or influence beyond the tribe by whom they are acknowledged, and whose ancestors they are, but supreme and all-pervading within that sphere.

ATYS. I. A beautiful shepherd of Phrygia, whom, according to Ovid, Cybele loved and made her priest, on condition that he should forever preserve his chastity. Atys, however, became enamored of the daughter of the river god, Sangarius, and violated his covenant with the goddess, who, to punish him, afflicted him with madness. Atys attempted to commit suicide, but Cybele interfered, and transformed him into a fir-tree. II. A son of Cræsus, king of Lydia. His father having dreamed that Atys would be slain by a spear, detained him at home, and would on no account expose him to any danger. The country of Mysia, however, being infested with a formidable wild boar, its inhabitants entreated Cræsus to aid them against their enemy. The king promised to succor them, and the prince urged his father so earnestly to allow him to accompany the hunters, that he at length reluctantly consented. The party proceeded to Mysia, and encountered the boar, but in the act of doing so Atys was accidentally killed by the spear of Adrastus—the very man appointed by Cræsus to guard the youth from danger.

AUBAINE, RIGHT OF, a mediæval right of the sovereign as regards aliens. The name is derived from *albanus*, *albani*, *albi*, a mediæval corruption of *alibi natus*. The principles of German society and jurisprudence made the full enjoyment of civil and private rights dependant on full citizenship in the community where one was settled. Thus the rights of a stranger were variously limited, and in certain cases he was reduced to the legal condition of a serf or *gleba adscriptus*. In the earliest epoch even natives changing their communal district or diocese were considered as *albi*, and the law was sometimes applied to them. But in the course of time it was strictly applied only to born foreigners, that is, to subjects of another sovereign. Thus the Provençal or the Burgundian was a foreigner in relation to the inhabitants of the Seine or Loire; and a Bavarian residing and dying in Saxony bore the same character. The right of aubaine empowered the sovereign to inherit the property of any foreigner dying without a will or without native-born heirs. This right was principally in use in France, and in its various applications was often exercised in a very oppressive manner by

nobles against settlers on their estates, and in their cities and boroughs. To encourage industry and trade, the kings of France sometimes renounced this right in favor of certain cities, which was the case with Lyons, where foreigners could inherit the property of their relatives who died there. The constituent assembly abolished this right by decrees published in 1790 and 1791. The Napoleonic code re-established it, providing, however, that special treaties with foreign governments might put their respective subjects on an equal footing with Frenchmen in the enjoyment of civil and private rights. Finally, in 1819, the right of aubaine was completely abolished by a special law. Several European governments still preserve the right to deduct a part of all property which is exported from their country by foreign or indirect heirs, or attain the same object by a heavy stamp tax. But special treaties have gradually brought the right of aubaine into universal disuse.

AUBE, a department of France, between lat. 47° 55' and 48° 45'; area 2,851 square miles. It was formed of the south part of the province of Champagne and a part of Burgundy. The surface is mostly level; the soil in the S. E. is productive, but in the remaining portion it is poor. The Seine, Aube, Armanche, and Vannes rivers flow through it. It is divided into the arrondissements of Troyes, Arcis-sur-Aube, Bar-sur-Aube, Bar-sur-Seine, and Nogent-sur-Seine. It is an active manufacturing district in pottery, glass, and tiles. Pop. 265,257.

AUBER, DANIEL FRANÇOIS ESPRIT, one of the most distinguished living composers, born at Caen in France, Jan. 29, 1784. His father, a print seller at Paris, in prosperous circumstances, allowed him to devote much attention to the study of music, for which he showed an unusual predilection, but which he cultivated merely as an amusement, or an elegant accomplishment. After a brief experience in the mercantile profession in London, which he found utterly distasteful, he returned to Paris, and devoted himself more than ever to his favorite art. A number of little compositions, vocal and instrumental, including a new arrangement of the opera, *Julia*, were produced by him at this time, many of which were performed with applause in private circles. After a severe course of study with Cherubini, he ventured, in 1813, to appear before the public in an opera, entitled *Séjour militaire*, which failed of success. It lacked entirely the grace and originality which had been admired in his previous works, and its reception so discouraged Auber that for several years he abandoned a career in which he had started under such favorable auspices. The death of his father in embarrassed circumstances, however, compelled him seriously to devote himself to his art as a means of support, and in 1819 he produced at the Opera Comique *Le Testament et les Billets-doux*, an opera in one act, which was, if possible, less successful than his previous attempt.

Undiscouraged by this failure, or by the sneers and ungenerous comments of the critics, who declared that his genius had been overrated by partial friends, he wrote *La Bergère Châtelaine*, which was produced in the same theatre in the early part of the year 1820, and completely turned the tables in his favor. All Auber's grace, spirit, and dramatic power appeared in this work, which, with *Emma, ou la Promesse imprudente*, produced the following year, may be considered to have founded the brilliant reputation he has since enjoyed. From this time forward he produced a great number of works, almost all of which were received with favor, while some are among the most successful operas now represented on the stage. An imitator of Rossini at the outset, he gradually acquired greater independence of style, and in *La Muette de Portici* (better known perhaps as *Masaniello*), in which his genius reached its culminating point of renown, he ventured to form a style of his own, to which he has since steadily adhered. In addition to the works mentioned, *Le Cheval de Bronze*, *Fra Diavolo*, *Le Domino noir*, *Les Diamants de la Couronne*, *L'Elizir d'Amour*, *Le Dieu et la Bayadère*, *Gustave*, *La Sirène*, and *Haydée*, are among his most popular operas. Many of them have been translated into English and German, and almost all into Italian, and their melodies are familiar wherever music is known. At the age of 74, Auber is still a vigorous and successful writer for the stage, as *L'Enfant prodigue*, and *Marco Spada*, his two latest works, will show; and it is a fact worthy of note, and of which few examples can be found in the history of musicians, that during the 50 years that he has composed music, his inventive powers seem never to have deserted him. The characteristics of Auber's music are sprightliness, grace, and great clearness and simplicity in their dramatic effects. His combinations are ingenious, if not profound, and his melodies naïve, and often tender, although rarely pathetic. He has succeeded best in buffo operas, for which Scribe has furnished him with admirable librettos, and which are models of light and graceful composition. It is said that he will never hear his operas a second time, either to avoid repeating his ideas, or, like a conscientious artist, to devote himself at once to new works. Auber is a member of the legion of honor, and of the academy of fine arts, to which he was elected in 1829, and now holds the office of director of the imperial music and *maître de chapelle*, at the Tuileries by the appointment of the Emperor Napoleon III.

AUBERT DU BAYET, JEAN BAPTISTE ANIBAL, a French general, born in Louisiana in 1759, died at Constantinople in 1797. He distinguished himself in the American war of independence, and, on being, in 1791, elected to the legislative assembly of France by the department of Isère, he took the part of La Fayette against his opponents, and was conspicuous in his support of all measures which were

antagonistic to royalty and to foreign influence in France. Subsequently, he again joined the army, became brigadier-general in 1792, and took an active part in the military operations at Mentz and in the Vendée. Some charges which had been brought against him in reference to the surrender of Mentz, turned out to have been groundless, and under the directory, in 1795, the office of the ministry of war was offered to him and accepted, but after a period of service, some difference of opinion with Carnot induced him to resign. He was appointed French ambassador at Constantinople in 1796, but died shortly afterward very suddenly.

AUBERT DE VITRY, FRANÇOIS JEAN PHILMEXER, a French politician and man of letters, born in Paris in 1765, died in 1849. He distinguished himself in 1789 by the publication of various pamphlets, and a work entitled *Rousseau à l'Assemblée nationale*, which was warmly applauded by men like Bernardin de St. Pierre, Condorcet, and La Harpe. He was an admirer of the Girondists, and attacked the Jacobins, for which he was arrested, but finally recovered his liberty, and subsequently became the principal secretary of the Westphalian cabinet under Jerome Bonaparte. He died in poverty.

AUBIGNÉ, J. H. MERLE D', a Swiss theologian, born in Geneva, Switzerland, Aug. 16, 1794. He is the third son of Louis Merle, a merchant of that city, and is nobly descended on the side of his father, whose father married the daughter of a distinguished French nobleman, D'Aubigné. From this paternal grandmother, Prof. Merle derives his surname (D'Aubigné), by a common Swiss custom. He was educated at Geneva, and after his collegiate course there, went to Berlin to attend the lectures of Neander. He was for several years the pastor of a French church at Hamburg, and afterward the favorite court preacher of the late king of Holland, at Brussels. In 1880 he returned to Geneva. When the evangelical society of Geneva founded their theological school, he was appointed to the chair of ecclesiastical history. As a writer both on theology and church history, but especially in the latter department, he is widely known both in Europe and America. His sympathies seem to identify him more with the Protestant church in England and America, and especially in Scotland, than with his brethren at home. His published works breathe a spirit of earnest devotion, united with a strong adherence to the Protestant faith. His ruling principle of "God in history," he has sought especially to unfold in his "History of the Reformation of the 16th Century," a work which has had an extensive circulation and a great influence both in this country and in Europe. His other works develop the same general thought, though perhaps in a less degree. In his last visit to Scotland (1856), he was presented with the freedom of the city of Edinburgh. Prof. Merle d'Aubigné is a man of enlarged and liberal views, and is never idle, though his health disqualifies him at present (1858) for constant

pulpit service. He has accumulated an ample fortune, and lives just on the outskirts of Geneva, in a villa commanding a fine view of the lake. He has been engaged on his great work "History of the Reformation," according to his own declaration, 24 years. He is now at work on the 6th volume, and there is yet a 7th and perhaps an 8th to come.

AUBIGNÉ, THEODORE AGRIPPA D', a French Protestant soldier and historian, born at St. Maury, Feb. 8, 1550, died at Geneva, April 29, 1630. Having expressed his indignation at the execution of some Protestants at the town of Amboise, he was sentenced to death unless he would abjure his religion. He escaped, and soon afterward took an active part in the siege of Orleans. When the siege was over, he betook himself to Geneva, to prosecute his studies, but on hearing that Condé was about to show fight to the enemies of the Calvinists, he went to join him. His constant activity and valor in the field attracted the attention of Henry IV., who covered him with official distinctions; but the stout partisan frequently gave offence to the court, both in his conversation and in his writings. He produced *Circe*, a tragedy, abounding in blunt sarcasm directed against the king and various members of the royal family. He was banished from the court, but after his recall he did not abate his frankness. After the king's death, he published his first 3 volumes of the *Histoire universelle* of his time (from 1550 to 1601). The 8d volume was seized and burnt by order of Parliament, and he fled to Geneva. During his absence, he was condemned to death, and while under this condemnation, he offered his hand to a Genevese lady of the name of Burlamaqui, who did not hesitate to accept him as husband after he had revealed his dangerous position with his wonted candor. By a former marriage he had one son, Constantine, who became the father of the celebrated Madame de Maintenon.

AUBLET, JEAN BAPTISTE CHRISTOPHE FUSÉE, a French botanist, born at Salon, in Provence, in 1720, died at Paris, in 1778; celebrated for his botanical labors in Mauritius, and in French Guiana, where he added 400 plants to the lists of botanical science. His herbarium was purchased by Sir Joseph Banks, and is now in the possession of the British museum.

AUBREY, JOHN, an English antiquary, born at Easton Piers, Wiltshire, March 12, 1625, died about the year 1700. He inherited a valuable estate from his father, which he wasted in law-suits, and extravagant expenditure, and was finally supported by the kindness of his friends. His published works are his "Miscellanies," and "The Natural History and Antiquities of the County of Surrey." His writings, chiefly in manuscript, have been of great value to antiquarians.

AUBRIOT, HUGUES, a provost of Paris, in the 14th century, born at Dijon, of low parentage, died there in 1892. Recommended to Charles V., by the duke of Burgundy, he soon

became the first magistrate of the French metropolis. In 1369, by the order of the king, he built the bastille, as a bulwark against the English. Many public works of importance, such as sewers and bridges, were completed under his administration. He incurred the animosity of the university, by the severe punishment he inflicted on some students, who, under the cover of their privileges and immunities, committed disorder. He was charged with the crimes of impiety and heresy, before the ecclesiastical courts, and after a long trial, was sentenced to perpetual imprisonment. He would probably have died in his dungeon, where he was fed on bread and water, if in the beginning of the reign of Charles VI. he had not been liberated by the Parisian insurgents, called Maillotins, who desired him for their leader. He seemingly assented to their proposal, but the very same night he escaped from Paris, and returned to his native province.

AUBRY, FRANÇOIS, a member of the French Convention, born at Paris, about the year 1750, died in 1802. In the convention he voted with that nondescript party called the Plain. In 1795 he succeeded Carnot as a member of the committee of public safety, and one of his first acts was to release Napoleon Bonaparte, then under arrest for having had some intercourse with Robespierre. Aubry, as secretary of war, was noted only for his incapacity. Under the directorial government, he entered the council of the 500, and openly conspired against the republic; so that, on the 18th Fructidor, he was condemned to transportation. He succeeded in making his escape from Cayenne, and not daring to return to France, where Bonaparte was in the ascendant, he sought a refuge in England, where he died.

AUBRY, MARIE OLYMPIE, better known as OLYMPE DE GOUGE, a French woman who acquired some notoriety in the beginning of the revolution. Born about 1755, at Montauban, she early repaired to Paris, in the hope of making herself known by her literary performances. Handsome, impulsive, gifted with a wonderful facility for extemporizing, so much so, that she was able to dictate, like Lope de Vega, a tragedy a day, her plays met with indifferent success. She then turned to politics, and made herself conspicuous. She published many pamphlets, and contributed to the establishment of female societies and clubs, where she frequently gave vent to her eloquence. Governed entirely by fancy and sentiment, she was of course inconsistent in politics, being at one time a revolutionist, and at another a royalist. When king Louis XVI. was arraigned before the national convention, she claimed the honor of being his defender. During the trial, she published a pamphlet, *Les trois urnes ou le salut de la France*, for which she was tried before the revolutionary tribunal, sentenced to death, and executed Nov. 5, 1793.

AUBRY DE MONTDIDIER, a French knight, in the latter part of the 14th century, is known

for the extraordinary manner in which his murderer was discovered and punished. There had been no witness of his death, except a dog which was devotedly attached to him, and which evinced such hatred toward Richard de Macaire, one of the companions in arms of his late master, and pursued him with such persistent barking, that suspicion was aroused; and, according to the usage of the middle ages, the "judgment of God" was ordered, and the man had to fight the dog. This singular combat took place in Paris, in 1371. Macaire was thrown to the ground, and confessed his guilt. This legend, which is far from being well authenticated, is the theme of several ballads and dramas in France and Germany.

AUBURN, capital of the county of Cayuga in N. Y., 174 miles west of Albany, 24 miles west of Owasco lake, the outlet of which intersects the town; pop. in 1855, 9,476. The city, though it stands on a somewhat uneven surface, is handsomely built, with wide streets. It is the seat of a Presbyterian theological seminary, founded in 1821, with a library of 6,000 volumes. It has 8 churches, a flourishing academy, 5 public free schools, 8 banks, and 7 newspaper offices. The Auburn state prison, which is celebrated for its peculiar system of prison discipline, is a fine, massive stone structure, enclosed by a wall which measures 500 feet on each side and about 80 feet in height. It sometimes has more than 600 convicts, who are employed in a variety of manufactures, the proceeds of which generally are sufficient to defray the expenses of the institution. The Owasco outlet has abundant power, which is employed both in the town and its vicinity in manufacturing cotton and woollen fabrics, carpets, iron, and paper, and in propelling a number of mills.

AUBUSSON, a town of France, in the department of Creuse, celebrated for its manufacture of carpets. This special branch of industry gave a great prosperity to the town during the 17th century, when it is asserted that out of a population of 12,000 inhabitants, upward of 2,000 were directly employed in the carpet trade. Unhappily, most of them were Protestants, so that the revocation of the edict of Nantes inflicted a terrible blow on the city, which from that time decreased in population and wealth; but a reaction seems to have taken place, and for the last 25 years Aubusson has materially improved. Pop. 5,196.

AUBUSSON, PIERRE D', grand master of the order of the hospitaliers, or knights of St. John of Jerusalem, and a cardinal-legate of the Latin church, was born at Lamarche, France, in 1423, died July 15, 1503. He is said to have first served in the Hungarian armies against the Turks. In 1444, he accompanied the dauphin, afterward Louis XI., son of Charles VII., in his campaign against the Swiss, and took part in the victory gained over them near Basel. He next repaired to the island of Rhodes, where he was admitted as a knight in the order of St. John. His activity, valor, and energy, soon made him one of

the most prominent members of the order, and on the death of the grand master, Des Ursins, he was unanimously elected as his successor. The latter part of the 15th century was a critical period for Christian civilization. Mohammed II., after taking Constantinople, had seized on Greece, Thrace, Servia, Moldavia, the islands of the Adriatic, and was threatening Italy. Rhodes stood as an advanced post for the protection of the Christian world. Aubusson had it strongly fortified, at the same time forming an alliance with the king of Tunis and the sultan of Egypt. Mohammed sent against Rhodes a fleet of 100 sail, carrying an army of 100,000 men, under the command of the apostate Misach Palaeologus. The Turks came in sight of the island Dec. 4, 1479, and began the siege regularly on May 23, 1480. All the defensive measures were conducted with energy, prudence, and indomitable courage. Aubusson was always the first against the enemy, fighting in the most dangerous places and accomplishing wonders. He received such severe wounds that his life was for several days despaired of; but he succeeded, and the Turks were obliged to raise the siege July 27, 1480. Mohammed, enraged at the fatal blow which had been inflicted on his arms, was preparing for a new expedition, which he was to command in person, when he intended to bring no less than 300,000 soldiers against Rhodes, but death prevented the fulfilment of his plan; and thenceforth for years Christian Europe had nothing to fear from the Turks. To this result Aubusson contributed no less by his skilful diplomacy than his prowess. He was active in the intrigues that troubled the court of Constantinople. He received at Rhodes Zizim, or Djem, the brother of Sultan Bajazet, who became in his hands a powerful instrument of influence on the Turkish court. Zizim was first transferred to France, then delivered to Pope Innocent VIII., who rewarded Aubusson with the title of cardinal and the office of legate of the holy see in Asia. Aubusson was certainly the most eminent among the Christian warriors and politicians of his time. Although only the chief of a military order and prince of a small island, he was respected by both the Christian and Mussulman sovereigns. He was regarded, not only by his contemporaries, but also by his admirers in the following ages, as "a man chosen of God among the French to put bounds to the conquests of the infidels," and received the surname of "shield of the Christian church." A stern defender of his faith, he also persecuted the Jews, whom he desired to exterminate from his island.

AUCH, an old city of southern France, department of Gers, the seat of an archbishopric, a tribunal of commerce, an imperial college, and a primary normal school; pop. in 1852, 12,141. In the time of Cæsar it was the capital of the Auscii, and was afterward the metropolis of Novempopulania. Auch has manufactures of thread and cotton stuffs, and carries on a considerable trade, particularly in the brandies of Armagnac.

AUOHMUTY, ROBERT, an eminent lawyer, and first of the American family of that name, died April, 1750, at Boston. He was of Scotch descent, the family holding an ancient barony in the north of Scotland, came to America and settled at Boston early in the 17th century. He was in practice about the year 1719, and was long remembered by the anecdotes preserved of his wit and shrewdness. He also possessed extraordinary talents, and it is said the profession in Massachusetts is indebted to him for the high character it has since maintained. He held high offices in Massachusetts, and when in England as agent for the colony, in 1741, is said to have planned the expedition to Cape Breton. He published a pamphlet, entitled "The Importance of Cape Breton to the British Nation, and a Plan for taking the Place."—**ROBERT**, son of the preceding, and, like him, an eminent lawyer of Boston. Although without a collegiate education, he was distinguished as an advocate and jury lawyer, among such contemporaries as Otis, Quincy, Hawley, &c. In 1767 he was appointed judge of the court of admiralty, which office he exercised as long as the royal authority was recognized; but in 1776, being a zealous tory, he left the country and went to England, where he died. He was associated with John Adams in the defence of Capt. Preston.

AUOHMUTY, SAMUEL, rector of Trinity church in New York, born in Boston in 1725, died in New York, March 4, 1777. He graduated at Harvard college in 1742, and went to England to study for holy orders. After his ordination he was appointed by the society for the propagation of the Gospel an assistant minister of Trinity church, and in 1764 succeeded to the charge of all the churches in the city. He remained in the city as the revolution approached, although he had made arrangements to visit England with the expectation of being consecrated bishop of New York, and in his ministrations in the church continued as before to read the prayers for the king. When the American army took possession of New York in 1777, this was forbidden by Lord Sterling, but the rector held his ground, although his church was entered by a company of soldiers, with drums beating, and with the threat of pulling him out of the pulpit. He then shut up the church and chapels, and took the keys with him to New Jersey, leaving orders that the churches should not be opened until the liturgy could be read without interruption. New York being again in the British possession, he attempted to return, but a passage was denied him. He then sought by a circuitous route to find his way back on foot, and succeeded after great hardships, only to find his church and parsonage burnt to the ground, and his papers and the records of the church destroyed. The next Sunday he preached for the last time in St. Paul's. The various trials he had undergone brought on an illness which carried him off in a few days.—**SIR SAMUEL**, brigadier-general in the British service and son of the

preceding, born in New York in 1758, died in Ireland, Aug. 11, 1822. He graduated at Columbia college in 1775, and the next year entered the army under Sir William Howe. He was adjutant-general in the expedition to Europe in 1781. In 1788, he was at the siege of Seringapatam in command of a company under Lord Cornwallis. Returning to England in 1808, he took command of the troops ordered to South America in 1806, with the rank of brigadier-general, and in 1807 carried the fortress and city of Montevideo by assault. In 1809, he was commander-in-chief in the Carnatic, and in 1811 took possession in the name of Great Britain of the valuable Dutch colonies of Java and Batavia. On his return to Europe he was put at the head of the forces in Ireland. He had all the qualities of an accomplished military chieftain, and twice received the thanks of parliament, and, after his return from South America, a service of plate and the rank of lieutenant-general.

AUCKLAND. I. WILLIAM EDEN, baron, a British diplomatist, born 1750, died 1814. In 1778 Mr. Eden was employed with Lord Carlisle in the settlement of the rupture between the British government and the American colonies. The period for negotiation had, however, passed, and the colonies declared their independence. He entered parliament and was secretary of Ireland, and was sent to the court of Louis XVI., with which he negotiated a commercial treaty. On the breaking out of the great revolution of 1789 he was sent to the Netherlands as envoy extraordinary, with instructions to use all his abilities to counter-check the new political relations growing out of the revolution. For the manner in which he discharged these duties he was called to an account by the house of commons on his return. He wrote "Principles of the Criminal Law," 1772, and various pamphlets, among others, "State of the Poor in England." **II. GEORGE EDEN**, baron and earl, born Aug. 1784, died Jan. 1849. In 1835, he was sent to India as governor-general. During his administration of this office, the opium war with China broke out. It was during Lord Auckland's government also that the expedition against Afghanistan took place, rendered so disastrous by the imprudence of the civil functionaries and the imbecility of the military commander. (See *AFGHANISTAN*.) Lord Auckland powerfully supported various amendments and reforms in the details of the Indian administration and the adoption of a sounder system of land revenue, the basis of which had been laid by Lord William Bentinck. Lord Auckland's chief personal action was, however, exercised upon a system of native schools, in which the children are gratuitously taught the elements of modern education, with a view to their admission into higher schools, where the successful pupils are trained as public officials. The improved administration of justice, both civil and criminal, also occupied his attention.

In 1841 he was succeeded by Lord Ellenborough, and on his return was created an earl, which title died with him. He was unmarried.

AUCTION (Lat. *auctio*, the act of increasing), a public sale, whereat persons openly compete, each offer or bid increasing upon the previous one, and the property being finally sold to him who will give the most for it, the highest bidder. In Holland, and at what are called Dutch auctions elsewhere, this process is reversed, the seller naming a price beyond the value of his goods, which is gradually lowered, until some one closes with the offer, the term auction, as applied to such a sale, being obviously a case of *lucus a non lucendo*, a complete misnomer. Rome, so far as is known, invented the auction, which was at first held for the sale of military spoils among the soldiers behind a spear stuck in the ground, whence it was called *auctio sub hasta* (under the spear), or *subhastatio*. The signal of the spear was afterward put up at all sorts of auctions, and the name was retained long after the signal was disused. At auctions in Rome, for which the permission of a magistrate must always be had, a spear was fixed in the forum by a crier, who proclaimed the articles to be sold and furnished the company with a catalogue upon tables. Subsequently sales were proclaimed by trumpet. Bids were made by holding up the fingers. After the death of Pertinax, A. D. 193, the prætorian guards put up the Roman empire at auction, which after a number of bids by Sulpician and Julian, the sole competitors, was knocked down to the latter for 6,250 drachms, about \$1,000, to each soldier.—In England sales "by the candle" or "by the inch of candle," which are still occasionally advertised, derive their name from an ancient practice of measuring the time within which the biddings must be completed by a candle, the highest bidder at the moment the inch burnt out becoming the purchaser. The minimum price at which the owner was willing to part with his property was sometimes put under a candlestick—"dumb biddings;" and in the north of England still occur sales where the bidders do not know each other's offers—"candlestick biddings." A curious kind of auction used, according to an old reporter (1 Dow. 8), to be held by females, who did not speak during the whole sale, but gave every person the moment he bid a glass of brandy, the purchaser being he who received the last glass in a private room. It is a little surprising that a practice, so well calculated to warm up competition, should have become obsolete. In England, a person is sometimes appointed, called the judge of the roup, to superintend the sale and act as arbiter if disputes arise. In modern times sales at public auction are as common as private sales, and are directed in most cases by the law, where it interposes between the owner of property and the purchaser—its object being the protection of those who necessarily put the dis-
